For a full list of the third-party software contained in this release, please go to the Legal Notices in the Abaqus 2026 HTML documentation, which can be obtained from a documentation installation, or in the SIMULIA Established Products 2026 Program Directory, which is available on *www.3ds.com*.

What's New

This page describes recent changes in Abaqus Scripting Reference.

2026 FD01

Python Commands

Revised Python objects are available.

Benefits: The features extend the capabilities of the Python commands.

Table 1: Revisions to Python Command Objects

Command	Object	Revisions
Mesh	*ElemType object*	ElemType now accepts parameters for controlling uniform background grid conversion of continuum elements to particles, for smoothed particle hydrodynamics (SPH) analyses in Abaqus/Explicit.

2026 GA

Python Commands

New Python objects are available.

Benefits: The features extend the capabilities of the Python commands.

Table 2: New Python Command Objects

Command	Object
Interaction	*GapDiffusivity object*
Material	*Electrode object*
	Electrode Particle object
	Electrode Particle Layer object
	Electrolyte object
Step (step)	*CoupledThermalElectrochemicalStructuralStep object*
	CoupledThermalElectrochemStructPorepressureStep object

Table 3: Revisions to Python Command Objects

Command	Object	Revisions
Step (miscellaneous)	*StepControl object*	The optional argument **tolerance** is added.
Interaction	*ContactProperty object*	Member **gapDiffusivity** is added.

2025 FD02

Python Commands

New and revised Python objects are available.

Benefits: The features extend the capabilities of the Python commands.

Table 4: New Python Command Objects

Command	Object
Boundary Condition	*ElectricPotentialElectrolyteBC object*
Boundary Condition	*ElectricPotentialElectrolyteBCState object*
Boundary Condition	*IonConcentrationBC object*
Boundary Condition	*IonConcentrationBCState object*
Load and Load Case	*DistIonConcBodyFlux object*
Load and Load Case	*DistIonConcBodyFluxState object*
Load and Load Case	*FluidSurfaceCurrent object*
Load and Load Case	*FluidSurfaceCurrentState object*
Load and Load Case	*IonConcentrationFluxState object*
Predefined field	*FluidElectricPotential object*
Predefined field	*IonConcentration object*
Step (step)	*CoupledThermalElectrochemicalStep object*
Step (miscellaneous)	*StepControl object*
Step (miscellaneous)	*CoupledThermalElectrochemicalStep object*

Table 5: Revisions to Python Command Objects

Command	Object	Revisions
Constraint	*Coupling object*	The required argument **coupling*Type*** can now take the value of UNIFORM, and the new optional arguments **uniformConstraint** and **temperatureDOFType** are added.

Command	Object	Revisions
Constraint	*Tie object*	Optional arguments **tieTemperature**, **tiePore**, **electricPotential**, **fluidElectricPotential**, and **ionConcentration** are now available.
Interaction	*FilmCondition object*	Optional argument **dynamicSurfaceActivation** is now available.
Interaction	*GapElectricalConductance object*	Optional arguments **Type**, **ionConcentrationDependencyC**, and **ionConcentrationDependencyP** are now available.
Interaction	*GapHeatGeneration object*	Optional arguments **mechanicalInteractionFraction**, **mechanicalInteractionWeightingFactor**, **electricalConductionSolidsFraction**, **electricalConductionSolidsWeightingFactor**, **electricalConductionLiquidsFraction**, and **electricalConductionLiquidsWeightingFactor** are now available.

2025 FD01

Animation File Formats

You can use the new MP4Options and GIFOptions objects in the Animation commands to save and load animations in MP4 and animated GIF formats.

Benefits: New file formats offer improved compatibility with modern media players and editing software, as well as HTML5 and third-party applications. File size can be significantly smaller, with no appreciable loss of quality.
You can save MP4 animations with the MPEG-4 codec. If you have an installation of the FFmpeg program that supports H.264 encoding on your system, you can save MP4 animations using the H.264 codec.

For more information, see *GIFOptions object*, *MP4Options object*, *Choosing the animation file format*, and *Using background images and movies*.

PDF Guides Available

You can download PDF versions of the Abaqus guides from each guide overview.

Benefits: You can easily access the PDF versions of the guides.
In earlier releases, PDF versions of the guides were updated only for the GA (General Availability) release and could be downloaded from the Dassault Systèmes Knowledge Base. As of 2025 FD01, the PDF guides will be updated with each release of the HTML versions of the guides.

For more information, see *Abaqus Scripting Reference Guide*.

2025 GA

Python Interactions Commands: FluidExchangeActivation Object

The FluidExchangeActivation object is now available in the Interactions profile commands.

Benefits: The feature extends the capabilities of the Interactions commands.

For more information, see *FluidExchangeActivation object*.

Python Interactions Commands: FluidExchangeActivationState Object

The FluidExchangeActivationState object is now available in the Interactions profile commands.

Benefits: The feature extends the capabilities of the Interactions commands.

For more information, see *FluidExchangeActivationState object*.

Python Interactions Commands: FluidInflator Object

The required arguments inflationTimeAmplitude and massFlowAmplitude are no longer available in the FluidInflator object.

Benefits: The functionality was extended, with these arguments appropriately available in the FluidInflatorActivation object instead.

For more information, see *FluidInflator object*.

Python Interactions Commands: FluidInflatorActivation Object

The FluidInflatorActivation object is now available in the Interactions profile commands.

Benefits: The feature extends the capabilities of the Interactions commands.

For more information, see *FluidInflatorActivation object*.

Python Interactions Commands: FluidInflatorActivationState Object

The FluidInflatorActivationState object is now available in the Interactions commands.

Benefits: The feature extends the capabilities of the Interactions commands.

For more information, see *FluidInflatorActivationState object*.

Python Interactions Commands: WearProperty Object

The WearProperty object is now available in the Interactions commands.

Benefits: The feature extends the capabilities of the Interactions commands.

For more information, see *WearProperty object*.

Python Interactions Commands: WearSurfacePropertyAssignment Object

The WearSurfacePropertyAssignment object is now available in the Interactions commands.

Benefits: The feature extends the capabilities of the Interactions commands.

For more information, see *WearSurfacePropertyAssignment object*.

Python Load and Load Case Commands: RotationalBodyForce Object

The new optional argument rotorDynamicloads is available in the RotationalBodyForce object.

Benefits: The feature extends the capabilities of the Load and Load Case commands.

For more information, see *RotationalBodyForce object*.

Python Path and Probe Commands: FreeBody Objects

The method getFreeBodyData() is now available in the FreeBody objects.

Benefits: The feature extends the capabilities of the Path and Probe commands.

For more information, see *FreeBody object*.

2024 FD03

New Method getMemberFromAll for Node and Element Sequences

There is a new Python API on node and element sequences to retrieve a member value for each item in the sequence. This applies to MeshNodeArray, MeshElementArray, MeshFaceArray, ODBMeshNodeArray, and ODBMeshElementArray.

Benefits: Retrieving a member from a large sequence (for example, the node label for every node) is much faster using this method than iterating over the sequence.

For more information, see *MeshNodeArray object*, *MeshElementArray object*, *MeshFaceArray object*, *OdbMeshNode object*, and *OdbMeshElement object*.

2024 GA

Python 3

Abaqus Python and Abaqus/CAE are now based on Python 3.10 instead of Python 2.7.

Benefits: This update brings Abaqus Python into conformance with a version of Python that is supported in the open-source community.

For more information, see *https://go.3ds.com/AbaqusPython*.

Python Beam Section Profile Commands: ChannelProfile Object

The ChannelProfile object is now available in the Beam Section profile commands.

Benefits: The feature extends the capabilities of the Beam Section profile commands.

For more information, see *ChannelProfile object*.

Python Beam Section Profile Commands: HatProfile Object

The HatProfile object is now available in the Beam Section profile commands.

Benefits: The feature extends the capabilities of the Beam Section profile commands.

For more information, see *HatProfile object*.

Python Constraint Commands: Coupling Object

The Coupling object is now available in the Constraint commands.

Benefits: The feature extends the capabilities of the Constraint commands.

For more information, see *Coupling object*.

Python Engineering Feature Commands: DiscreteFastener Object

The optional argument *rotatonalCoupling* is now available in the DiscreteFastener object.

Benefits: The feature extends the capabilities of the Engineering Feature commands.

For more information, see *DiscreteFastener object*.

Python Interaction Commands: ContactMassScalingExp Object

The ContactMassScalingExp object is now available in the Interaction commands.

Benefits: The feature extends the capabilities of the Interaction commands.

For more information, see *ContactMassScalingExp object*.

Python Job Commands: OptimizationProcess Object

The optional argument licenseType is now available in the OptimizationProcess object.

Benefits: The feature extends the capabilities of the Job commands.

For more information, see *ContactMassScalingExp object*.

Python Odb Commands: OdbAssembly Object

The method getMassProperties is now available in the OdbAssembly object.

Benefits: The feature extends the capabilities of the Odb commands.

For more information, see *OdbAssembly object*.

Python Optimization Commands: SingleTermDesignResponse Object

The optional argument stepOperation is no longer available in the SingleTermDesignResponse object.

Benefits: The functionality was removed from the Optimization commands: SingleTermDesignResponse object.

For more information, see *SingleTermDesignResponse object*.

Python Section Commands: BeamSection Object

The optional argument beamSectionOffset is now available in the BeamSection object.

Benefits: The feature extends the capabilities of the Section commands.

For more information, see *BeamSection object*.

Python Step Commands (Step): StaticLinearPerturbationStep Object

The optional arguments solutionTechnique, gapDistance, and scaleFactor are now available in the StaticLinearPerturbationStep object.

Benefits: The feature extends the capabilities of the Step commands (step).

For more information, see *StaticLinearPerturbationStep object*.

Python XY Commands: Session Object

The optional argument useMaxStressValue is now available in the Session object.

Benefits: The feature extends the capabilities of the XY commands.

For more information, see *Session object*.

Abaqus Scripting Reference Guide

The Abaqus Scripting Reference Guide contains a complete description of each command in the Abaqus Scripting Interface.

This guide is a part of the Abaqus® documentation collection, which describes all the capabilities of the Abaqus finite element analysis technology used in SIMULIA® applications.

Python commands

Python commands are used to read and write data from an output database.

In this section:

- *Abaqus/CAE Display Preferences commands*
- *Adaptivity commands*
- *Amplitude commands*
- *Animation commands*
- *Annotation commands*
- *Assembly commands*
- *Basic geometry commands*
- *Beam Section profile commands*
- *Boundary Condition commands*
- *Calibration commands*
- *Canvas commands*
- *Connector commands*
- *Constraint commands*
- *CustomKernel module*
- *Datum commands*
- *Display Group commands*
- *Display Options commands*
- *Edit mesh commands*
- *Engineering Feature commands*
- *Feature commands*
- *Field commands*
- *Field Report commands*
- *Filter commands*
- *Input File Parser commands*
- *Interaction commands*
- *Job commands*
- *Load and Load Case commands*
- *Material commands*
- *Mdb commands*
- *Mesh commands*
- *Messaging commands*

Abaqus/CAE Display Preferences commands

Display preferences commands are used to edit the Abaqus/CAE preferences file, `abaqus_2026.gpr`.

In this section:

- *caePrefsAccess module*
- *CaeGuiPrefs object*
- *CaeKerPrefs object*

caePrefsAccess module

The Python module `caePrefsAccess` contains functions that enable you to edit the Abaqus/CAE preferences file, `abaqus_2026.gpr`.

Access

```
import caePrefsAccess
```

getGuiPrefsFileName(...)

This function enables you to retrieve the location of your `abaqus_2026.gpr` file.

Path

```
caePrefsAccess.getGuiPrefsFileName
```

Arguments

None.

Return value

A String with the default file name for the GUI preferences file.

getDisplayNamesInGuiPreferences(...)

The `abaqus_2026.gpr` file stores a separate `guiPreferences` record for each display that you use. This function returns a list of every displayName recorded in the preferences file.

Path

```
caePrefsAccess.getDisplayNamesInGuiPreferences
```

Required arguments

fileName	A String that specifies the path to the preferences file.

Optional arguments

None.

Return value

A list of Strings of displayNames.

Exceptions

None.

printValuesList(...)

This function enables you to print all of the options and their values for a set of `guiPreferences` or `sessionOptions` settings derived from the `abaqus_2026.gpr` file.

Path

```
caePrefsAccess.printValuesList
```

Required arguments

object
The `guiPreferences` object or `sessionOptions` object for which you want to print options and their values.

Optional arguments

maxRecursionDepth
An Int, or SymbolicConstant UNLIMITED, that specifies the depth of recursion when accessing the attributes of *object*.

asString
A Boolean specifying how the string representation of each option is printed. If *asString* is True, printValuesList prints the `str` of each option; otherwise printValuesList prints the `repr` of the options. The default value is False.

Return value

A String displaying the path, name, and value for all of the options in the object that you select.

Exceptions

None.

openGuiPreferences(...)

This function enables you to examine and change many default behaviors in the Abaqus/CAE graphical user interface. Abaqus stores preferences for each display you use in a separate `guiPreferences` section of the `abaqus_2026.gpr` file.

Path

```
caePrefsAccess.openGuiPreferences
```

Required arguments

displayName
A String that specifies the display for which you want to investigate GUI preferences from the `abaqus_2026.gpr` file. You can retrieve the available display names in the file by using the `getDisplayNamesInGuiPreferences` method.

Optional arguments

fileName A String specifying the path to the preferences file. The `openGuiPreferences` method uses this argument if you are working with a preferences file that is not at the default location.

If this argument is omitted, the `abaqus_2026.gpr` file in your home directory is opened.

Return value

A CaeGuiPrefs object.

Exceptions

None.

openSessionOptions(...)

This function enables you to examine and change the default behavior for many session options Abaqus/CAE; that is, the settings that you can save in Abaqus/CAE from the **File->Save Display Options** menu option. Abaqus stores default session options in the `sessionOptions` section of the `abaqus_2026.gpr` file.

Path

```
caePrefsAccess.openSessionOptions
```

Required arguments

None.

Optional arguments

fileName A String specifying the path to the preferences file. The `openSessionOptions` method uses this argument if you are working with a preferences file that is not at the default location.

If this argument is omitted, the `abaqus_2026.gpr` file in your home directory is opened.

directory A SymbolicConstant specifying the location of the preferences file. Possible values are:

- CURRENT to open the preferences file in the current directory (`caePrefsAccess`.CURRENT)
- HOME to open the preferences file in your home directory (`caePrefsAccess`.HOME)

The default value is HOME. Either *fileName* or *directory* must be supplied. The *fileName* or *directory* arguments are mutually exclusive.

Return value

A CaeKerPrefs object.

Exceptions

None.

CaeGuiPrefs object

The CaeGuiPrefs object contains the details of the graphical preferences in a `guiPreferences` section of the `abaqus_2026.gpr` file.

Access

```
import caePrefsAccess
caePrefsAccess.openGuiPreferences(...)
```

`save(...)`

This method saves the `guiPreferences` section specified in the current *fileName*.

Required arguments

None.

Optional arguments

backupFile A Boolean specifying whether Abaqus should save a numbered backup copy of the preferences file, *fileName*. Default is True.

Return value

`None.`

Exceptions

None.

`saveAs(...)`

This method saves the `guiPreferences` settings to the specified location.

Required arguments

fileName A String specifying the path to the preferences file.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

Members

The CaeGuiPrefs object has the following member:

fileName
A String specifying the path to the preferences file.

CaeKerPrefs object

The CaeKerPrefs object contains the details of the `sessionOptions`.

Access

```
import caePrefsAccess
caePrefsAccess.openSessionOptions(...)
```

`save(...)`

This method saves the `sessionOptions` in the current *fileName*.

Required arguments

None.

Optional arguments

backupFile A Boolean specifying whether save a numbered backup copy of the preferences file, *fileName*. Default is True.

Return value

`None.`

Exceptions

None.

`saveAs(...)`

This method saves the `sessionOptions` to the specified location.

Required arguments

fileName A String specifying the path to the preferences file.

directory A SymbolicConstant specifying the location of the preferences file. Possible values are:

- CURRENT to open the preferences file in the current directory (`caePrefsAccess`.CURRENT)
- HOME to open the preferences file in your home directory (`caePrefsAccess`.HOME)

The default value is HOME. Either *fileName* or *directory* must be supplied. The *fileName* or *directory* arguments are mutually exclusive.

Optional arguments

None.

Return value

```
None.
```

Exceptions

None.

Members

The CaeKerPrefs object has the following member:

fileName
A String specifying the path to the preferences file that the CaeKerPrefs object represents.

Adaptivity commands

The Adaptivity commands are used to define objects, perform analyses, and calculate new meshes for Arbitrary Lagrangian Eularian (ALE) adaptive smoothing (adaptive meshing) and varying topology adaptivity (adaptive remeshing).

In this section:

- *AdaptiveMeshConstraint object*
- *AdaptiveMeshConstraintState object*
- *AdaptiveMeshControl object*
- *AdaptiveMeshDomain object*
- *AdaptivityIteration object*
- *AdaptivityProcess object*
- *DisplacementAdaptiveMeshConstraint object*
- *DisplacementAdaptiveMeshConstraintState object*
- *ErrorIndicatorResult object*
- *Model object*
- *RemeshingRule object*
- *RuleResult object*
- *VelocityAdaptiveMeshConstraint object*
- *VelocityAdaptiveMeshConstraintState object*

AdaptiveMeshConstraint object

The AdaptiveMeshConstraint object is the abstract base type for other Arbitrary Lagrangian Eularian (ALE) style AdaptiveMeshConstraint objects. The AdaptiveMeshConstraint object has no explicit constructor. The methods and members of the AdaptiveMeshConstraint object are common to all objects derived from the AdaptiveMeshConstraint object.

Access

```
import step
mdb.models[name].adaptiveMeshConstraints[name]
```

deactivate(...)

This method deactivates the adaptive mesh constraint in the specified step and all subsequent steps.

Required arguments

stepName A String specifying the name of the step in which the adaptive mesh constraint is deactivated.

Optional arguments

None.

Return value

None.

Exceptions

TextError.

move(...)

This method moves the adaptive mesh constraint state from one step to a different step.

Required arguments

fromStepName A String specifying the name of the step from which the adaptive mesh constraint state is moved.

toStepName A String specifying the name of the step to which the adaptive mesh constraint state is moved.

Optional arguments

None.

Return value

None.

Exceptions

TextError.

reset(...)

This method resets the adaptive mesh constraint state of the specified step to the state of the previous analysis step.

Required arguments

stepName	A String specifying the name of the step in which the adaptive mesh constraint state is reset.

Optional arguments

None.

Return value

`None.`

Exceptions

TextError.

resume()

This method resumes the adaptive mesh constraint that was previously suppressed.

Arguments

None.

Return value

`None.`

Exceptions

None.

suppress()

This method suppresses the adaptive mesh constraint.

Arguments

None.

Return value

`None.`

Exceptions

None.

`delete(...)`

This method allows you to delete existing adaptive mesh constraints.

Required arguments

indices A sequence of Ints specifying the index of each adaptive mesh constraint to delete.

Optional arguments

None.

Return value

`None`.

Exceptions

None.

Members

The AdaptiveMeshConstraint object can have the following members:

name A String specifying the adaptive mesh constraint repository key.

category A SymbolicConstant specifying the category of the adaptive mesh constraint. Possible values are MECHANICAL and THERMAL.

region A *Region* object specifying the region to which the adaptive mesh constraint is applied.

localCsys `None` or a *DatumCsys* object specifying the local coordinate system of the adaptive mesh constraint's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

AdaptiveMeshConstraintState object

The AdaptiveMeshConstraintState object is the abstract base type for other Arbitrary Lagrangian Eularian (ALE) style AdaptiveMeshConstraintState objects. The AdaptiveMeshConstraintState object has no explicit constructor or methods. The members of the AdaptiveMeshConstraintState object are common to all objects derived from the AdaptiveMeshConstraintState object.

Access

```
import step
mdb.models[name].steps[name].adaptiveMeshConstraintStates[name]
```

Members

The AdaptiveMeshConstraintState object has the following members:

amplitudeState

A SymbolicConstant specifying the propagation state of the amplitude reference. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

status

A SymbolicConstant specifying the propagation state of the AdaptiveMeshConstraintState object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- PROPAGATED_FROM_BASE_STATE
- MODIFIED_FROM_BASE_STATE
- DEACTIVATED_FROM_BASE_STATE
- BUILT_INTO_MODES

amplitude

A String specifying the name of the amplitude reference. The String is empty if the adaptive mesh constraint has no amplitude reference.

AdaptiveMeshControl object

The AdaptiveMeshControl object is used to control various aspects of Arbitrary Lagrangian Eularian (ALE) style adaptive smoothing and advection algorithms applied to an ALE adaptive mesh domain.

Access

```
import step
mdb.models[name].adaptiveMeshControls[name]
```

AdaptiveMeshControl(...)

This method creates an AdaptiveMeshControl object.

Path

```
mdb.models[name].AdaptiveMeshControl
```

Required arguments

name
A String specifying the name of the object.

Optional arguments

remapping
A SymbolicConstant specifying the remapping algorithm. Possible values are FIRST_ORDER_ADVECTION and SECOND_ORDER_ADVECTION. The default value is SECOND_ORDER_ADVECTION.

smoothingAlgorithm
A SymbolicConstant specifying the type of smoothing algorithm to use. Possible values are STANDARD and GEOMETRY_ENHANCED. The default value is GEOMETRY_ENHANCED.

smoothingPriority
A SymbolicConstant specifying the type of smoothing to perform. Possible values are UNIFORM and GRADED. The default value is UNIFORM.

initialFeatureAngle
A Float specifying the initial geometric feature angle, θ_I, in degrees. Possible values are $0° \leq \theta_I \leq 180°$. The default value is 30.0.

transitionFeatureAngle
A Float specifying the transitional feature angle, θ_T, in degrees. Possible values are $0° \leq \theta_T \leq 180°$. The default value is 30.0.

momentumAdvection
A SymbolicConstant specifying the type of momentum advection algorithm. Possible values are ELEMENT_CENTER_PROJECTION and HALF_INDEX_SHIFT. The default value is ELEMENT_CENTER_PROJECTION.

meshingPredictor
A SymbolicConstant specifying the nodal starting location to use for remeshing. Possible values are CURRENT and PREVIOUS. The default value is CURRENT.

curvatureRefinement
A Float specifying the solution dependence weight, α_C. Possible values are $0.0 \le \alpha_C \le 1.0$. The default value is 1.0.

volumetricSmoothingWeight
A Float specifying the weight used by Abaqus/Explicit for the volumetric smoothing method. The default value is 1.0.

laplacianSmoothingWeight
A Float specifying the weight for the Laplacian smoothing method. The default value is 0.0.

equipotentialSmoothingWeight
A Float specifying the weight for the equipotential smoothing method. The default value is 0.0.

meshConstraintAngle
A Float specifying the initial geometric feature angle, θ_C. Possible values are $0° \le \theta_C \le 180°$. The default value is 60.0.

originalConfigurationProjectionWeight
A Float specifying the weight for the original configuration projection method. The default value is 1.0.

standardVolumetricSmoothingWeight
A Float specifying the weight used by Abaqus/Standard for the volumetric smoothing method. The default value is 0.0.

Return value

An AdaptiveMeshControl object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the AdaptiveMeshControl object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *AdaptiveMeshControl* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The AdaptiveMeshControl object has members with the same names and descriptions as the arguments to the *AdaptiveMeshControl* method.

AdaptiveMeshDomain object

The AdaptiveMeshDomain object defines the region and controls that govern an Arbitrary Lagrangian Eularian (ALE) style adaptive smoothing mesh domain.

Access

```
import step
mdb.models[name].steps[name].adaptiveMeshDomains[name]
```

AdaptiveMeshDomain(...)

This method creates an AdaptiveMeshDomain object.

Path

```
mdb.models[name].steps[name].AdaptiveMeshDomain
```

Required arguments

region A *Region* object specifying the region to which the adaptive mesh domain is applied.

Optional arguments

controls A String specifying the name of an *AdaptiveMeshControl* object.

frequency An Int specifying the frequency in increments at which adaptive meshing will be performed. The default value is 10.

initialMeshSweeps An Int specifying the number of mesh sweeps to be performed at the beginning of the first step in which this adaptive mesh definition is active. The default value is 5.

meshSweeps An Int specifying the number of mesh sweeps to be performed in each adaptive mesh increment. The default value is 1.

Return value

An AdaptiveMeshDomain object.

Exceptions

RangeError.

setValues(...)

This method modifies the AdaptiveMeshDomain object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *AdaptiveMeshDomain* method.

Return value

`None.`

Exceptions

RangeError.

Members

The AdaptiveMeshDomain object has members with the same names and descriptions as the arguments to the *AdaptiveMeshDomain* method.

AdaptivityIteration object

The AdaptivityIteration object contains information about a given iteration of the varying topology adaptivity process (adaptive remeshing).

Access

```
import job
mdb.adaptivityProcesses[name].iterations[i]
```

AdaptivityIteration(...)

This method creates an AdaptivityIteration object.

Path

```
mdb.adaptivityProcesses[name].AdaptivityIteration
```

Required arguments

iteration	An Int specifying the sequence number for this iteration in the adaptivity process.
jobName	A String specifying the name of the job that was run for this iteration.
modelName	A String specifying the name of the model that was analyzed and remeshed in this iteration.
odbPath	A String specifying the path to the ODB file that was created for this iteration.
remeshingErrors	An Int specifying the number of part instances which generated errors while remeshing the model in this iteration of the adaptivity process.

Optional arguments

None.

Return value

An AdaptivityIteration object.

Exceptions

None.

Members

The AdaptivityIteration object has members with the same names and descriptions as the arguments to the *AdaptivityIteration* method.

In addition, the AdaptivityIteration object can have the following member:

ruleResults

A repository of *RuleResult* objects specifying the calculated results from sizing functions corresponding to the *RemeshingRule* objects for this iteration of an adaptivity process.

AdaptivityProcess object

The AdaptivityProcess object defines a series of jobs that will be submitted for analysis. Abaqus performs adaptive remeshing between each job.

Access

```
import job
mdb.adaptivityProcesses[name]
```

AdaptivityProcess(...)

This method creates an AdaptivityProcess object.

Path

```
mdb.AdaptivityProcess
```

Required arguments

name A String specifying the name of the Adaptivity Process.

job A *ModelJob* object specifying a job to be used as the prototype for all analysis jobs run by the adaptivity process.

Optional arguments

maxIterations An Int specifying the maximum number of analysis jobs that will be run by the Adaptivity Process. Abaqus performs adaptive remeshing between each analysis. The default value is 3.

jobPrefix A String specifying the prefix to use for jobs created by the adaptivity process. An empty string indicates that the name of the adaptivity process should be used. The default value is an empty string.

Return value

An AdaptivityProcess object.

Exceptions

AbaqusException.

submit(...)

This method begins the process of analysis and adaptive remeshing.

Required arguments

None.

Optional arguments

waitForCompletion A Boolean specifying whether to interrupt the execution of a script until the end of the adaptive remeshing process is reached.

datacheckJob A Boolean specifying whether to run the adaptivity as a datacheck analysis. The default value is False. The datacheckJob and continueJob arguments cannot both be True.

continueJob A Boolean specifying whether to run the adaptivity as a continuation analysis. The default value is False. The datacheckJob and continueJob arguments cannot both be True.

Return value

`None.`

Exceptions

None.

`setValues(...)`

This method modifies the AdaptivityProcess object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *AdaptivityProcess* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The AdaptivityProcess object has members with the same names and descriptions as the arguments to the *AdaptivityProcess* method.

In addition, the AdaptivityProcess object can have the following members:

status A SymbolicConstant specifying the status of the adaptivity process. Possible values are SUBMITTED, RUNNING, ABORTED, TERMINATED, and COMPLETED.

iterations A repository of *AdaptivityIteration* objects specifying the *AdaptivityIteration* objects received during running the adaptivity process.

DisplacementAdaptiveMeshConstraint object

The DisplacementAdaptiveMeshConstraint object stores the data for an Arbitrary Lagrangian Eularian (ALE) style displacement/rotation adaptive mesh constraint.

The DisplacementAdaptiveMeshConstraint object is derived from the *AdaptiveMeshConstraint* object.

Access

```
import step
mdb.models[name].adaptiveMeshConstraints[name]
```

DisplacementAdaptiveMeshConstraint(...)

This method creates a DisplacementAdaptiveMeshConstraint object.

Path

```
mdb.models[name].DisplacementAdaptiveMeshConstraint
```

Required arguments

name
A String specifying the adaptive mesh constraint repository key.

createStepName
A String specifying the name of the step in which the adaptive mesh constraint is created.

region
A *Region* object specifying the region to which the adaptive mesh constraint is applied.

Optional arguments

u1
A Float or a SymbolicConstant specifying the displacement component in the 1-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

Note:

Although *u1*, *u2*, *u3*, *ur1*, *ur2*, and *ur3* are optional arguments, at least one of them must be specified.

u2
A Float or a SymbolicConstant specifying the displacement component in the 2-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

u3
A Float or a SymbolicConstant specifying the displacement component in the 3-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

ur1
A Float or a SymbolicConstant specifying the rotational displacement component about the 1-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

ur2
A Float or a SymbolicConstant specifying the rotational displacement component about the 2-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

ur3 A Float or a SymbolicConstant specifying the rotational displacement component about the 3-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

amplitude A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the adaptive mesh constraint has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

motionType A SymbolicConstant specifying the mesh motion in relation to the underlying material. Possible values are INDEPENDENT, FOLLOW and USER_DEFINED. The default value is INDEPENDENT.

localCsys `None` or a *DatumCsys* object specifying the local coordinate system of the adaptive mesh constraint's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

Return value

A DisplacementAdaptiveMeshConstraint object.

Exceptions

None.

`setValues(...)`

This method modifies the data for an existing DisplacementAdaptiveMeshConstraint object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *DisplacementAdaptiveMeshConstraint* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing DisplacementAdaptiveMeshConstraint object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the adaptive mesh constraint is modified.

Optional arguments

u1 A Float or a SymbolicConstant specifying the displacement component in the 1-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

u2 A Float or a SymbolicConstant specifying the displacement component in the 2-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

u3 A Float or a SymbolicConstant specifying the displacement component in the 3-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

ur1 A Float or a SymbolicConstant specifying the rotational displacement component about the 1-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

ur2 A Float or a SymbolicConstant specifying the rotational displacement component about the 2-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

ur3 A Float or a SymbolicConstant specifying the rotational displacement component about the 3-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the adaptive mesh constraint is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The DisplacementAdaptiveMeshConstraint object can have the following members:

name A String specifying the adaptive mesh constraint repository key.

category A SymbolicConstant specifying the category of the adaptive mesh constraint. Possible values are MECHANICAL and THERMAL.

region A *Region* object specifying the region to which the adaptive mesh constraint is applied.

localCsys

`None` or a *DatumCsys* object specifying the local coordinate system of the adaptive mesh constraint's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

DisplacementAdaptiveMeshConstraintState object

The DisplacementAdaptiveMeshConstraintState object stores the propagating data for an Arbitrary Lagrangian Eularian (ALE) style displacement/rotation adaptive mesh constraint in a step. One instance of this object is created internally by the *DisplacementAdaptiveMeshConstraint* object for each step. The instance is also deleted internally by the *DisplacementAdaptiveMeshConstraint* object.

The DisplacementAdaptiveMeshConstraintState object has no constructor or methods.

The DisplacementAdaptiveMeshConstraintState object is derived from the *AdaptiveMeshConstraintState* object.

Access

```
import step
mdb.models[name].steps[name].adaptiveMeshConstraintStates[name]
```

Members

The DisplacementAdaptiveMeshConstraintState object has the following members:

u1
A Float or a Complex specifying the displacement component in the 1-direction.

u2
A Float or a Complex specifying the displacement component in the 2-direction.

u3
A Float or a Complex specifying the displacement component in the 3-direction.

ur1
A Float or a Complex specifying the rotational displacement component about the 1-direction.

ur2
A Float or a Complex specifying the rotational displacement component about the 2-direction.

ur3
A Float or a Complex specifying the rotational displacement component about the 3-direction.

u1State
A SymbolicConstant specifying the propagation state of the displacement component in the 1-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

u2State
A SymbolicConstant specifying the propagation state of the displacement component in the 2-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

u3State
A SymbolicConstant specifying the propagation state of the displacement component in the 3-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

ur1State
A SymbolicConstant specifying the propagation state of the rotational displacement component about the 1-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

ur2State
A SymbolicConstant specifying the propagation state of the rotational displacement component about the 2-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

ur3State
A SymbolicConstant specifying the propagation state of the rotational displacement component about the 3-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

amplitudeState A SymbolicConstant specifying the propagation state of the amplitude reference. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

status A SymbolicConstant specifying the propagation state of the *AdaptiveMeshConstraintState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- PROPAGATED_FROM_BASE_STATE
- MODIFIED_FROM_BASE_STATE
- DEACTIVATED_FROM_BASE_STATE
- BUILT_INTO_MODES

amplitude A String specifying the name of the amplitude reference. The String is empty if the adaptive mesh constraint has no amplitude reference.

Corresponding analysis keywords

- **ADAPTIVE MESH CONSTRAINT*, TYPE=DISPLACEMENT (degree of freedom: 1, 2, 3, 4, 5, or 6)

ErrorIndicatorResult object

The ErrorIndicatorResult object contains result information corresponding to an error indicator variable in a *RemeshingRule* object for an adaptivity iteration.

Access

```
import job
mdb.adaptivityProcesses[name].iterations[i].ruleResults[name]\
.indicatorResults[name]
```

ErrorIndicatorResult(...)

This method creates an ErrorIndicatorResult with data for an error indicator variable in a *RemeshingRule* for a given adaptivity iteration.

Path

```
mdb.adaptivityProcesses[name].iterations[i].ruleResults[name]\
.ErrorIndicatorResult
```

Required arguments

name A String specifying the name of the error indicator variable to which these results correspond.

results A String-to-Float Dictionary specifying the calculated results from the sizing function corresponding to the error indicator variable represented by this ErrorIndicatorResult.

Optional arguments

None.

Return value

An ErrorIndicatorResult object.

Exceptions

AbaqusException.

Members

The ErrorIndicatorResult object has members with the same names and descriptions as the arguments to the *ErrorIndicatorResult* method.

Model object

The following commands operate on Model objects. For more information about the Model object, see *Model object*.

Access

```
import mesh
```

`adaptiveRemesh(...)`

This method remeshes the model using the active remesh rules in the model and the error indicator results from a previous analysis.

Required arguments

odb An *Odb* object containing error output field results.

Optional arguments

None.

Return value

An *AdaptivityIteration* Object.

Exceptions

None.

RemeshingRule object

The RemeshingRule object controls the adaptive remeshing resizing and the error indicators written to the output database for a specified region of the model.

Access

```
import mesh
mdb.models[name].remeshingRules[name]
```

RemeshingRule(...)

This method creates a RemeshingRule object.

Path

```
mdb.models[name].RemeshingRule
```

Required arguments

name
A String specifying the name of the object.

stepName
A String specifying the name of the step in which resizing should occur for this rule.

variables
A sequence of Strings specifying the output request variables that Abaqus will use as error indicators.

Optional arguments

description
A String specifying a descriptive string for this rule. The default value is an empty string.

region
The SymbolicConstant MODEL or a *Region* object specifying the region in which Abaqus will remesh and generate output. The SymbolicConstant MODEL represents the entire applicable model. The default value is MODEL.

sizingMethod
A SymbolicConstant specifying the method for calculating the new mesh sizes. The SymbolicConstant DEFAULT indicates that Abaqus will use the default calculation method for each individual variable. Possible values are DEFAULT, UNIFORM_ERROR, and MINIMUM_MAXIMUM. The default value is DEFAULT.

errorTarget
A Float specifying the target error percentage for each variable in the region. A value of 0.0 indicates that Abaqus will use automated error target reduction for the region. You use the *errorTarget* argument when *sizingMethod*=UNIFORM_ERROR. The default value is 0.0.

maxSolutionErrorTarget
A Float specifying the target error percentage at the location of the maximum solution value in the region. A value of 0.0 indicates that Abaqus will use automated error target reduction for the region. You use the *maxSolutionErrorTarget* argument when *sizingMethod*=MINIMUM_MAXIMUM. The default value is 0.0.

minSolutionErrorTarget
A Float specifying the target error percentage at the location of the minimum solution value in the region. A value of 0.0 indicates that Abaqus will use automated error target reduction for the region. You use the *minSolutionErrorTarget* argument when *sizingMethod*=MINIMUM_MAXIMUM. The default value is 0.0.

meshBias
An Int specifying an indication of how much Abaqus will bias the mesh toward the location of the maximum solution value in the region. The higher the value, the more the mesh will bias towards the location of the maximum solution value. You use the *meshBias* argument when *sizingMethod*=MINIMUM_MAXIMUM. The default value is 0.0.

minElementSize
A Float specifying the minimum size of any single element. The default value is 0.0.

maxElementSize
A Float specifying the maximum size of any single element. The default value is 0.0.

outputFrequency
A SymbolicConstant specifying the frequency with which the error indicators are saved to the output database file (`.odb`). Possible values are LAST_INCREMENT and ALL_INCREMENTS. The default value is LAST_INCREMENT.

specifyMinSize
A Boolean specifying an indication of whether to use a user-supplied minimum element size or to calculate a characteristic minimum element size. The default value is OFF.

specifyMaxSize
A Boolean specifying an indication of whether to use a user-supplied maximum element size or to calculate a characteristic maximum element size. The default value is ON.

coarseningFactor
A SymbolicConstant or an Int specifying an indication of the upper limit on the element growth from one remeshing iteration to the next. Possible values are DEFAULT_LIMIT and NOT_ALLOWED. The default value is DEFAULT_LIMIT.

refinementFactor
A SymbolicConstant or an Int specifying an indication of the upper limit on element shrinkage from one remeshing iteration to the next. Possible values are DEFAULT_LIMIT and NOT_ALLOWED. The default value is DEFAULT_LIMIT.

elementCountLimit
`None` or an Int specifying an approximate limit on the number of elements that will be created during remeshing. Use `None` to indicate there is not upper limit. The default value is `None`.

Return value

A RemeshingRule object.

Exceptions

AbaqusException.

`resume()`

This method resumes the remeshing rule that was previously suppressed.

Arguments

None.

Return value

`None.`

Exceptions

None.

`suppress()`

This method suppresses the remeshing rule. Abaqus will not remesh regions where the rules are suppressed.

Arguments

None.

Return value

`None.`

Exceptions

None.

`setValues(...)`

This method modifies the RemeshingRule object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *RemeshingRule* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The RemeshingRule object has members with the same names and descriptions as the arguments to the *RemeshingRule* method.

In addition, the RemeshingRule object has the following member:

suppressed

A Boolean specifying whether the remeshing rule is suppressed. Remeshing of the remeshing rule's region will not occur if you suppress a rule. The default value is OFF.

RuleResult object

The RuleResult object contains result information corresponding to a *RemeshingRule* object for an adaptivity iteration.

Access

```
import job
mdb.adaptivityProcesses[name].iterations[i].ruleResults[name]
```

RuleResult(...)

This method creates a RuleResult with data for a *RemeshingRule* for a given adaptivity iteration.

Path

```
mdb.adaptivityProcesses[name].iterations[i].RuleResult
```

Required arguments

name
A String specifying the name of the Remeshing Rule to which these results correspond.

indicatorResults
A repository of *ErrorIndicatorResult* objects specifying the calculated results from the sizing function corresponding to the error indicator variables for the Remeshing Rule.

numElems
An Int specifying the number of elements before remeshing in the region of the Remeshing Rule.

minSizeElemCount
An Int specifying the number of elements that were constrained to the minimum element size by the Remeshing Rule.

Optional arguments

satisfiedVars
A sequence of Strings specifying the error indicator variables that have satisfied the Remeshing Rule.

Return value

A RuleResult object.

Exceptions

AbaqusException.

Members

The RuleResult object has members with the same names and descriptions as the arguments to the *RuleResult* method.

VelocityAdaptiveMeshConstraint object

The VelocityAdaptiveMeshConstraint object stores the data for an Arbitrary Lagrangian Eularian (ALE) style velocity adaptive mesh constraint.

The VelocityAdaptiveMeshConstraint object is derived from the *AdaptiveMeshConstraint* object.

Access

```
import step
mdb.models[name].adaptiveMeshConstraints[name]
```

VelocityAdaptiveMeshConstraint(...)

This method creates a VelocityAdaptiveMeshConstraint object.

Path

```
mdb.models[name].VelocityAdaptiveMeshConstraint
```

Required arguments

name
A String specifying the adaptive mesh constraint repository key.

createStepName
A String specifying the name of the step in which the adaptive mesh constraint is created.

region
A *Region* object specifying the region to which the adaptive mesh constraint is applied.

Optional arguments

v1
A Float or a SymbolicConstant specifying the velocity component in the 1-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

Note:

Although *v1*, *v2*, *v3*, *vr1*, *vr2*, and *vr3* are optional arguments, at least one of them must be specified.

v2
A Float or a SymbolicConstant specifying the velocity component in the 2-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

v3
A Float or a SymbolicConstant specifying the velocity component in the 3-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

vr1
A Float or a SymbolicConstant specifying the rotational velocity component about the 1-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

vr2
A Float or a SymbolicConstant specifying the rotational velocity component about the 2-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

vr3
A Float or a SymbolicConstant specifying the rotational velocity component about the 3-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

amplitude
A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the adaptive mesh constraint has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

localCsys
`None` or a *DatumCsys* object specifying the local coordinate system of the adaptive mesh constraint's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

motionType
A SymbolicConstant specifying the mesh motion in relation to the underlying material. Possible values are INDEPENDENT, FOLLOW and USER_DEFINED. The default value is INDEPENDENT.

Return value

A VelocityAdaptiveMeshConstraint object.

Exceptions

None.

`setValues(...)`

This method modifies the data for an existing VelocityAdaptiveMeshConstraint object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *VelocityAdaptiveMeshConstraint* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing VelocityAdaptiveMeshConstraint object in the specified step.

Required arguments

stepName
A String specifying the name of the step in which the adaptive mesh constraint is modified.

Optional arguments

v1
A Float or a SymbolicConstant specifying the velocity component in the 1-direction. Possible values for the SymbolicConstant are SET and FREED.

v2
A Float or a SymbolicConstant specifying the velocity component in the 2-direction. Possible values for the SymbolicConstant are SET and FREED.

v3
A Float or a SymbolicConstant specifying the velocity component in the 3-direction. Possible values for the SymbolicConstant are SET and FREED.

vr1
A Float or a SymbolicConstant specifying the rotational velocity component about the 1-direction. Possible values for the SymbolicConstant are SET and FREED.

vr2
A Float or a SymbolicConstant specifying the rotational velocity component about the 2-direction. Possible values for the SymbolicConstant are SET and FREED.

vr3
A Float or a SymbolicConstant specifying the rotational velocity component about the 3-direction. Possible values for the SymbolicConstant are SET and FREED.

amplitude
A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the adaptive mesh constraint is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value
`None`.

Exceptions
None.

Members
The VelocityAdaptiveMeshConstraint object can have the following members:

name
A String specifying the adaptive mesh constraint repository key.

category
A SymbolicConstant specifying the category of the adaptive mesh constraint. Possible values are MECHANICAL and THERMAL.

region
A *Region* object specifying the region to which the adaptive mesh constraint is applied.

localCsys
`None` or a *DatumCsys* object specifying the local coordinate system of the adaptive mesh constraint's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

VelocityAdaptiveMeshConstraintState object

The VelocityAdaptiveMeshConstraintState object stores the propagating data for an Arbitrary Lagrangian Eularian (ALE) style velocity adaptive mesh constraint in a step. One instance of this object is created internally by the *VelocityAdaptiveMeshConstraint* object for each step. The instance is also deleted internally by the *VelocityAdaptiveMeshConstraint* object.

The VelocityAdaptiveMeshConstraintState object has no constructor or methods.

The VelocityAdaptiveMeshConstraintState object is derived from the *AdaptiveMeshConstraintState* object.

Access

```
import step
mdb.models[name].steps[name].adaptiveMeshConstraintStates[name]
```

Members

The VelocityAdaptiveMeshConstraintState object has the following members:

v1
A Float specifying the velocity component in the 1-direction.

v2
A Float specifying the velocity component in the 2-direction.

v3
A Float specifying the velocity component in the 3-direction.

vr1
A Float specifying the rotational velocity component about the 1-direction.

vr2
A Float specifying the rotational velocity component about the 2-direction.

vr3
A Float specifying the rotational velocity component about the 3-direction.

v1State
A SymbolicConstant specifying the propagation state of the velocity component in the 1-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

v2State
A SymbolicConstant specifying the propagation state of the velocity component in the 2-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

v3State
A SymbolicConstant specifying the propagation state of the velocity component in the 3-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

vr1State
A SymbolicConstant specifying the propagation state of the rotational velocity component about the 1-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

vr2State
A SymbolicConstant specifying the propagation state of the rotational velocity component about the 2-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

vr3State
A SymbolicConstant specifying the propagation state of the rotational velocity component about the 3-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

amplitudeState

A SymbolicConstant specifying the propagation state of the amplitude reference. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

status

A SymbolicConstant specifying the propagation state of the *AdaptiveMeshConstraintState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- PROPAGATED_FROM_BASE_STATE
- MODIFIED_FROM_BASE_STATE
- DEACTIVATED_FROM_BASE_STATE
- BUILT_INTO_MODES

amplitude

A String specifying the name of the amplitude reference. The String is empty if the adaptive mesh constraint has no amplitude reference.

Corresponding analysis keywords

- **ADAPTIVE MESH CONSTRAINT*, TYPE=VELOCITY (degree of freedom: 1, 2, 3, 4, 5, or 6)

Amplitude commands

Amplitude commands are used to create arbitrary time or frequency variations of load, displacement, and some interaction attributes throughout a step using step time or throughout an analysis using total time.

In this section:

- *Amplitude object*
- *ActuatorAmplitude object*
- *BaselineCorrection object*
- *Correlation object*
- *DecayAmplitude object*
- *EquallySpacedAmplitude object*
- *ModulatedAmplitude object*
- *PeriodicAmplitude object*
- *PsdDefinition object*
- *SmoothStepAmplitude object*
- *SolutionDependentAmplitude object*
- *SpectrumAmplitude object*
- *TabularAmplitude object*
- *UserAmplitude object*

Amplitude object

The Amplitude object is the abstract base type for other Amplitude objects. The Amplitude object has no explicit constructor. The methods and members of the Amplitude object are common to all objects derived from the Amplitude.

Access

```
import amplitude
mdb.models[name].amplitudes[name]
import odbAmplitude
session.odbs[name].amplitudes[name]
```

Members

The Amplitude object has the following members:

name

A String specifying the repository key.

timeSpan

A SymbolicConstant specifying the time span of the amplitude. Possible values are STEP and TOTAL. The default value is STEP.

ActuatorAmplitude object

The ActuatorAmplitude object defines an actuator amplitude curve.

The ActuatorAmplitude object is derived from the *Amplitude* object.

Access

```
import amplitude
mdb.models[name].amplitudes[name]
import odbAmplitude
session.odbs[name].amplitudes[name]
```

ActuatorAmplitude(...)

This method creates a ActuatorAmplitude object.

Path

```
mdb.models[name].ActuatorAmplitude
session.odbs[name].ActuatorAmplitude
```

Required arguments

name A String specifying the repository key.

Optional arguments

timeSpan A SymbolicConstant specifying the time span of the amplitude. Possible values are STEP and TOTAL. The default value is STEP.

Return value

An ActuatorAmplitude object.

Exceptions

InvalidNameError and RangeError.

setValues(...)

This method modifies the ActuatorAmplitude object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ActuatorAmplitude* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The ActuatorAmplitude object has members with the same names and descriptions as the arguments to the *ActuatorAmplitude* method.

Corresponding analysis keywords

- **AMPLITUDE*

BaselineCorrection object

The BaselineCorrection object modifies an acceleration history to minimize the overall drift of the displacement obtained from the time integration of the given acceleration.

Access

```
import amplitude
mdb.models[name].amplitudes[name].baselineCorrection
import odbAmplitude
session.odbs[name].amplitudes[name].baselineCorrection
```

BaselineCorrection(...)

This method creates a BaselineCorrection object.

Path

```
mdb.models[name].amplitudes[name].BaselineCorrection
session.odbs[name].amplitudes[name].BaselineCorrection
```

Required arguments

None.

Optional arguments

intervals A sequence of Floats specifying the correction time interval end points. Possible values are positive and monotonically increasing Floats. The default value is an empty sequence.

Return value

A BaselineCorrection object.

Exceptions

RangeError.

setValues(...)

This method modifies the BaselineCorrection object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *BaselineCorrection* method.

Return value

`None.`

Exceptions

RangeError.

Members

The BaselineCorrection object has members with the same names and descriptions as the arguments to the *BaselineCorrection* method.

Corresponding analysis keywords

- **BASELINE CORRECTION*

Correlation object

A Correlation is an object used to define the cross-correlation as part of the definition of random loading.

The Correlation object is derived from the *Amplitude* object.

Access

```
import load
mdb.models[name].boundaryConditions[name].correlation[i]
```

Members

The Correlation object has the following members:

name
A String specifying the repository key.

approach
A SymbolicConstant specifying the approach used in the correlation data representation. Possible values are CORRELATED, MOVING_NOISE, UNCORRELATED, and USER. The default value is CORRELATED.

data
A tuple of tuples of Floats specifying the real and imaginary part of the scaling factor. If *approach*=MOVING_NOISE, then *data* represents the noise velocity components 1, 2, and 3.

timeSpan
A SymbolicConstant specifying the time span of the amplitude. Possible values are STEP and TOTAL. The default value is STEP.

DecayAmplitude object

The DecayAmplitude object defines an amplitude curve using an exponential decay.

The DecayAmplitude object is derived from the *Amplitude* object.

Access

```
import amplitude
mdb.models[name].amplitudes[name]
import odbAmplitude
session.odbs[name].amplitudes[name]
```

DecayAmplitude(...)

This method creates a DecayAmplitude object.

Path

```
mdb.models[name].DecayAmplitude
session.odbs[name].DecayAmplitude
```

Required arguments

name A String specifying the repository key.

initial A Float specifying the constant A_0.

maximum A Float specifying the coefficient A.

start A Float specifying the starting time t_0. Possible values are non-negative numbers.

decayTime A Float specifying the decay time t_d. Possible values are non-negative numbers.

Optional arguments

timeSpan A SymbolicConstant specifying the time span of the amplitude. Possible values are STEP and TOTAL. The default value is STEP.

Return value

A DecayAmplitude object.

Exceptions

InvalidNameError and RangeError.

setValues(...)

This method modifies the DecayAmplitude object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *DecayAmplitude* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The DecayAmplitude object has members with the same names and descriptions as the arguments to the *DecayAmplitude* method.

Corresponding analysis keywords

- **AMPLITUDE*

EquallySpacedAmplitude object

The EquallySpacedAmplitude object defines a list of amplitude values at fixed time intervals beginning at a specified value of time.

The EquallySpacedAmplitude object is derived from the *Amplitude* object.

Access

```
import amplitude
mdb.models[name].amplitudes[name]
import odbAmplitude
session.odbs[name].amplitudes[name]
```

EquallySpacedAmplitude(...)

This method creates an EquallySpacedAmplitude object.

Path

```
mdb.models[name].EquallySpacedAmplitude
session.odbs[name].EquallySpacedAmplitude
```

Required arguments

name A String specifying the repository key.

fixedInterval A Float specifying the fixed time interval at which the amplitude data are given. Possible values are positive numbers.

data A sequence of Floats specifying the amplitude values.

Optional arguments

begin A Float specifying the time at which the first amplitude data are given. Possible values are non-negative numbers. The default value is 0.0.

smooth The SymbolicConstant SOLVER_DEFAULT or a Float specifying the degree of smoothing. Possible float values are $0 \le smoothing \le 0.5$. If *smooth*=SOLVER_DEFAULT, the default degree of smoothing will be determined by the solver. The default value is SOLVER_DEFAULT.

timeSpan A SymbolicConstant specifying the time span of the amplitude. Possible values are STEP and TOTAL. The default value is STEP.

Return value

An EquallySpacedAmplitude object.

Exceptions

InvalidNameError and RangeError.

`setValues(...)`

This method modifies the EquallySpacedAmplitude object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *EquallySpacedAmplitude* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The EquallySpacedAmplitude object has members with the same names and descriptions as the arguments to the *EquallySpacedAmplitude* method.

In addition, the EquallySpacedAmplitude object can have the following member:

baselineCorrection A *BaselineCorrection* object.

Corresponding analysis keywords

- **AMPLITUDE*

ModulatedAmplitude object

The ModulatedAmplitude object defines a modulated amplitude curve.

The ModulatedAmplitude object is derived from the *Amplitude* object.

Access

```
import amplitude
mdb.models[name].amplitudes[name]
import odbAmplitude
session.odbs[name].amplitudes[name]
```

ModulatedAmplitude(...)

This method creates a ModulatedAmplitude object.

Path

```
mdb.models[name].ModulatedAmplitude
session.odbs[name].ModulatedAmplitude
```

Required arguments

name A String specifying the repository key.

initial A Float specifying the constant A_0.

magnitude A Float specifying the coefficient A.

start A Float specifying the starting time t_0. Possible values are non-negative numbers.

frequency1 A Float specifying the circular frequency 1 (ω_1). Possible values are positive numbers.

frequency2 A Float specifying the circular frequency 2 (ω_2). Possible values are positive numbers.

Optional arguments

timeSpan A SymbolicConstant specifying the time span of the amplitude. Possible values are STEP and TOTAL. The default value is STEP.

Return value

A ModulatedAmplitude object.

Exceptions

InvalidNameError and RangeError.

`setValues(...)`

This method modifies the ModulatedAmplitude object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ModulatedAmplitude* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The ModulatedAmplitude object has members with the same names and descriptions as the arguments to the *ModulatedAmplitude* method.

Corresponding analysis keywords

- **AMPLITUDE*

PeriodicAmplitude object

The PeriodicAmplitude object defines an amplitude curve using a Fourier series.

The PeriodicAmplitude object is derived from the *Amplitude* object.

Access

```
import amplitude
mdb.models[name].amplitudes[name]
import odbAmplitude
session.odbs[name].amplitudes[name]
```

PeriodicAmplitude(...)

This method creates a PeriodicAmplitude object.

Path

```
mdb.models[name].PeriodicAmplitude
session.odbs[name].PeriodicAmplitude
```

Required arguments

name A String specifying the repository key.

frequency A Float specifying the circular frequency ω. Possible values are positive numbers.

start A Float specifying the starting time t_0. Possible values are positive numbers.

a_0 A Float specifying the constant A_0.

data A sequence of pairs of Floats specifying A_i and B_i pairs.

Optional arguments

timeSpan A SymbolicConstant specifying the time span of the amplitude. Possible values are STEP and TOTAL. The default value is STEP.

Return value

A PeriodicAmplitude object.

Exceptions

InvalidNameError and RangeError.

setValues(...)

This method modifies the PeriodicAmplitude object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *PeriodicAmplitude* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The PeriodicAmplitude object has members with the same names and descriptions as the arguments to the *PeriodicAmplitude* method.

Corresponding analysis keywords

- **AMPLITUDE*

PsdDefinition object

The PsdDefinition object defines the cross-spectral density frequency function for random response loading.

The PsdDefinition object is derived from the *Amplitude* object.

Access

```
import amplitude
mdb.models[name].amplitudes[name]
import odbAmplitude
session.odbs[name].amplitudes[name]
```

PsdDefinition(...)

This method creates a PsdDefinition object.

Path

```
mdb.models[name].PsdDefinition
session.odbs[name].PsdDefinition
```

Required arguments

name
A String specifying the repository key.

data
A sequence of sequences of Floats specifying the real part of the frequency function, the imaginary part of the frequency function, and the frequency or frequency band number values, depending on the value of *unitType*.

Optional arguments

unitType
A SymbolicConstant specifying the type of units for specifying the frequency function. FORCE implies power units. BASE implies gravity used to define base motion. DB implies decibel units. Possible values are FORCE, BASE, and DB. The default value is FORCE.

referenceGravityAcceleration
A Float specifying the reference gravity acceleration. This argument applies when *unitType* = BASE. The default value is 1.0.

referenecePower
A Float specifying the reference power value, in load units squared. This argument applies when *unitType* = DB. The default value is 0.0.

user
A Boolean specifying whether the frequency function is defined in user subroutine UPSD. If specified, then *data* is not applicable, and the *unitType* value must not be DB. The default value is OFF.

timeSpan
A SymbolicConstant specifying the time span of the amplitude. Possible values are STEP and TOTAL. The default value is STEP.

amplitude

A String specifying the name of the amplitude that describes the dynamic event used to define the cross-spectral density frequency function. The default value is an empty string.

Return value

A PsdDefinition object.

Exceptions

InvalidNameError and RangeError.

`setValues(...)`

This method modifies the PsdDefinition object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *PsdDefinition* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The PsdDefinition object has members with the same names and descriptions as the arguments to the *PsdDefinition* method.

Corresponding analysis keywords

- **PSD-DEFINITION*

SmoothStepAmplitude object

The SmoothStepAmplitude object defines an amplitude that ramps up or down smoothly from one data point to another.

The SmoothStepAmplitude object is derived from the *Amplitude* object.

Access

```
import amplitude
mdb.models[name].amplitudes[name]
import odbAmplitude
session.odbs[name].amplitudes[name]
```

SmoothStepAmplitude(...)

This method creates a SmoothStepAmplitude object.

Path

```
mdb.models[name].SmoothStepAmplitude
session.odbs[name].SmoothStepAmplitude
```

Required arguments

name A String specifying the repository key.

data A sequence of pairs of Floats specifying time/frequency and amplitude pairs. Possible values for time/frequency are positive numbers.

Optional arguments

timeSpan A SymbolicConstant specifying the time span of the amplitude. Possible values are STEP and TOTAL. The default value is STEP.

Return value

A SmoothStepAmplitude object.

Exceptions

InvalidNameError and RangeError.

setValues(...)

This method modifies the SmoothStepAmplitude object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *SmoothStepAmplitude* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The SmoothStepAmplitude object has members with the same names and descriptions as the arguments to the *SmoothStepAmplitude* method.

Corresponding analysis keywords

- **AMPLITUDE*

SolutionDependentAmplitude object

The SolutionDependentAmplitude object defines a solution-dependent amplitude for superplastic forming analysis.

The SolutionDependentAmplitude object is derived from the *Amplitude* object.

Access

```
import amplitude
mdb.models[name].amplitudes[name]
import odbAmplitude
session.odbs[name].amplitudes[name]
```

SolutionDependentAmplitude(...)

This method creates a SolutionDependentAmplitude object.

Path

```
mdb.models[name].SolutionDependentAmplitude
session.odbs[name].SolutionDependentAmplitude
```

Required arguments

name A String specifying the repository key.

Optional arguments

initial A Float specifying the initial amplitude value. Possible values are those between *minimum* and *maximum*. The default value is 1.0.

minimum A Float specifying the minimum amplitude value. Possible values are those smaller than *maximum* and *initial*. The default value is 0.1.

maximum A Float specifying the maximum amplitude value. Possible values are those larger than *minimum* and *initial*. The default value is 1000.0.

timeSpan A SymbolicConstant specifying the time span of the amplitude. Possible values are STEP and TOTAL. The default value is STEP.

Return value

A SolutionDependentAmplitude object.

Exceptions

InvalidNameError and RangeError.

setValues(...)

This method modifies the SolutionDependentAmplitude object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *SolutionDependentAmplitude* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The SolutionDependentAmplitude object has members with the same names and descriptions as the arguments to the *SolutionDependentAmplitude* method.

Corresponding analysis keywords

- **AMPLITUDE*

SpectrumAmplitude object

The SpectrumAmplitude object defines the spectrum of responses for displacement, velocity, or acceleration to be used in a response spectrum analysis.

The SpectrumAmplitude object is derived from the *Amplitude* object.

Access

```
import amplitude
mdb.models[name].amplitudes[name]
import odbAmplitude
session.odbs[name].amplitudes[name]
```

SpectrumAmplitude(...)

This method creates a SpectrumAmplitude object.

Path

```
mdb.models[name].SpectrumAmplitude
session.odbs[name].SpectrumAmplitude
```

Required arguments

name A String specifying the repository key.

method A SymbolicConstant specifying the method for specifying the spectrum. Possible values are DEFINE and CALCULATE.

data A sequence of sequences of Floats specifying the magnitude, frequency, and damping values.

Optional arguments

specificationUnits A SymbolicConstant specifying the units used for specifying the spectrum. Possible values are DISPLACEMENT, VELOCITY, ACCELERATION, and GRAVITY. The default value is ACCELERATION.

eventUnits A SymbolicConstant specifying the units used to describe the dynamic event in the amplitude used for the calculation. Possible values are EVENT_DISPLACEMENT, EVENT_VELOCITY, EVENT_ACCELERATION, and EVENT_GRAVITY. The default value is EVENT_ACCELERATION.

solution A SymbolicConstant specifying the solution method for the dynamic equations. Possible values are ABSOLUTE_VALUE and RELATIVE_VALUE. The default value is ABSOLUTE_VALUE.

timeIncrement A Float specifying the implicit time increment used to calculate the spectrum. This argument is required when the *method* = CALCULATE. The default value is 0.0.

gravity
A Float specifying the acceleration due to gravity. This argument applies only when *specificationUnits* = GRAVITY or*eventUnits* = GRAVITY. The default value is 1.0.

criticalDamping
A Boolean specifying whether to calculate the spectrum for only the specified range of critical damping values or a list of values. If *criticalDamping* = ON, the spectrum is calculated only for the specified range of critical damping values. If *criticalDamping* = OFF, the spectrum is calculated for a list of damping values. The default value is OFF.

timeSpan
A SymbolicConstant specifying the time span of the amplitude. Possible values are STEP and TOTAL. The default value is STEP.

amplitude
A String specifying the name of the amplitude that describes the dynamic event used to calculate the spectrum. The default value is an empty string.

Return value

A SpectrumAmplitude object.

Exceptions

InvalidNameError and RangeError.

`setValues(...)`

This method modifies the SpectrumAmplitude object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *SpectrumAmplitude* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The SpectrumAmplitude object has members with the same names and descriptions as the arguments to the *SpectrumAmplitude* method.

Corresponding analysis keywords

- **SPECTRUM*

TabularAmplitude object

The TabularAmplitude object defines an amplitude curve as a table of values at convenient points on the time scale.

The TabularAmplitude object is derived from the *Amplitude* object.

Access

```
import amplitude
mdb.models[name].amplitudes[name]
import odbAmplitude
session.odbs[name].amplitudes[name]
```

TabularAmplitude(...)

This method creates a TabularAmplitude object.

Path

```
mdb.models[name].TabularAmplitude
session.odbs[name].TabularAmplitude
```

Required arguments

name A String specifying the repository key.

data A sequence of pairs of Floats specifying time/frequency and amplitude pairs. Possible values for time/frequency are positive numbers.

Optional arguments

smooth The SymbolicConstant SOLVER_DEFAULT or a Float specifying the degree of smoothing. Possible float values are between 0 and 0.5. If *smooth*=SOLVER_DEFAULT, the default degree of smoothing will be determined by the solver. The default value is SOLVER_DEFAULT.

timeSpan A SymbolicConstant specifying the time span of the amplitude. Possible values are STEP and TOTAL. The default value is STEP.

Return value

A TabularAmplitude object.

Exceptions

InvalidNameError and RangeError.

setValues(...)

This method modifies the TabularAmplitude object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *TabularAmplitude* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The TabularAmplitude object has members with the same names and descriptions as the arguments to the *TabularAmplitude* method.

In addition, the TabularAmplitude object can have the following member:

baselineCorrection A *BaselineCorrection* object.

Corresponding analysis keywords

- **AMPLITUDE*

UserAmplitude object

The UserAmplitude object defines an amplitude curve using the *UAMP* or *VUAMP* user subroutine.

The UserAmplitude object is derived from the *Amplitude* object.

Access

```
import amplitude
mdb.models[name].amplitudes[name]
import odbAmplitude
session.odbs[name].amplitudes[name]
```

UserAmplitude(...)

This method creates a UserAmplitude object.

Path

```
mdb.models[name].UserAmplitude
session.odbs[name].UserAmplitude
```

Required arguments

name A String specifying the repository key.

numVariables An Int specifying the number of variables for the *UAMP* or *VUAMP* user subroutine.

Optional arguments

timeSpan A SymbolicConstant specifying the time span of the amplitude. Possible values are STEP and TOTAL. The default value is STEP.

Return value

A UserAmplitude object.

Exceptions

InvalidNameError and RangeError.

setValues(...)

This method modifies the UserAmplitude object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *UserAmplitude* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The UserAmplitude object has members with the same names and descriptions as the arguments to the *UserAmplitude* method.

Corresponding analysis keywords

- **AMPLITUDE*

Animation commands

Animation commands are used to create and control object-based and image-based animations in the viewport.

In this section:

- *AnimationController object*
- *AnimationOptions object*
- *AVIOptions object*
- *GIFOptions object*
- *ImageAnimationOptions object*
- *ImageAnimation object*
- *QuickTimeOptions object*
- *MP4Options object*
- *Movie object*
- *Session object*

AnimationController object

The AnimationController object controls all object-based animation to be displayed in the viewports. The AnimationController object has no constructor. Abaqus creates the *animationController* member when it creates the *Session* object.

Access

```
import animation
session.viewports[name].animationController
```

play(...)

This method begins the animation.

Required arguments

None.

Optional arguments

duration The SymbolicConstant UNLIMITED or an Int specifying how many seconds to play the animation. The default value is UNLIMITED.

Return value

`None.`

Exceptions

If *animationType*=NONE: AnimationError: animationType not set

stop()

This method stops the animation.

Arguments

None.

Return value

`None.`

Exceptions

None.

incrementFrame()

This method increments the animation frame.

Arguments

None.

Return value

`None.`

Exceptions

None.

decrementFrame()

This method decrements the animation frame.

Arguments

None.

Return value

`None.`

Exceptions

None.

showFrame(...)

This method renders the specified frame of the animation.

Required arguments

None.

Optional arguments

frame An Int specifying the frame number.

value A Float specifying the frame: for *animationType*=TIME_HISTORY the frame with the time nearest to this value, for *animationType*=HARMONIC the frame with the angle nearest to this value, for *animationType*=SCALE_FACTOR the frame with the scale value nearest to this value.

Return value

`None.`

Exceptions

None.

showFirstFrame()

This method renders the first frame of the animation.

Arguments

None.

Return value

`None.`

Exceptions

None.

showLastFrame()

This method renders the last frame of the animation.

Arguments

None.

Return value

`None.`

Exceptions

None.

setValues(...)

This method modifies the AnimationController object.

Required arguments

None.

Optional arguments

animationType A SymbolicConstant specifying the type of movie to play. Possible values are SCALE_FACTOR, HARMONIC, TIME_HISTORY, and NONE. The default value is NONE.

Return value

`None.`

Exceptions

RangeError.

Members

The AnimationController object can have the following members:

animationType A SymbolicConstant specifying the type of movie to play. Possible values are SCALE_FACTOR, HARMONIC, TIME_HISTORY, and NONE. The default value is NONE.

state A SymbolicConstant specifying the state of the animation controller. Possible values are STOP and PLAY. The default value is STOP.

AnimationOptions object

The AnimationOptions object is used to store values and attributes associated with an *AnimationController* object.

The AnimationOptions object has no constructor command. Abaqus creates the *animationOptions* member when it creates the *AnimationController* object.

Access

```
import animation
session.animationOptions
```

`setValues(...)`

This method modifies the AnimationOptions object.

Required arguments

None.

Optional arguments

mode

A SymbolicConstant specifying the animation mode. Possible values are PLAY_ONCE, LOOP, LOOP_BACKWARD, and SWING. The default value is LOOP.

frameRate

An Int specifying the animation rate in frames/second. Possible values are 1 ≤*frameRate*≤ 100. The default value is 50.

frameCounter

A Boolean specifying whether to show the frame counter. The default value is ON.

relativeScaling

A SymbolicConstant specifying the relative scaling when the *AnimationController* object's *animationType*=SCALE_FACTOR or HARMONIC. Possible values are FULL_CYCLE and HALF_CYCLE. The default value is HALF_CYCLE.

numScaleFactorFrames

An Int specifying the number of frames to be used when the *AnimationController* object's *animationType*=SCALE_FACTOR or HARMONIC. The default value is 7.

timeHistoryMode

A SymbolicConstant specifying whether the time history animation is time based or frame based. Possible values are FRAME_BASED and TIME_BASED. The default value is FRAME_BASED.

maxTime

A Float specifying the maximum time for time based time history animation when *maxTimeAutoCompute* = False.

maxTimeAutoCompute

A Boolean specifying whether the animation maximum time value should be computed from the active frames when *timeHistoryMode* is set to TIME_BASED. The default value is ON.

minTime

A Float specifying the minimum time for time based time history animation when *minTimeAutoCompute* = False.

minTimeAutoCompute

A Boolean specifying whether the animation minimum time value should be computed from the active frames when *timeHistoryMode* is set to TIME_BASED. The default value is ON.

timeIncrement

A Float specifying the time increment for frame selection when *timeHistoryMode* is set to TIME_BASED.

xyUseHighlightMethod

A Boolean specifying whether to use the highlight method to draw the time tracker line and symbols. The default value is ON.

xyShowLine

A Boolean specifying whether to show the time tracker line. The default value is ON.

xyLineStyle

A SymbolicConstant specifying the *X–Y* time tracker line style. Possible values are SOLID, DASHED, DOTTED, and DOT_DASH. The default value is SOLID.

xyLineThickness

A SymbolicConstant specifying the *X–Y* time tracker line thickness. Possible values are VERY_THIN, THIN, MEDIUM, and THICK. The default value is MEDIUM.

xyLineColor

A String specifying the color used to plot the *X–Y* time tracker line when *xyUseHighlightMethod* = False. The default value is "Yellow".

xyShowSymbol

A Boolean specifying whether to show the time tracker symbols. The default value is ON.

xySymbolMarker

A SymbolicConstant specifying the marker type to be used for all animation capable *X–Y* curve or the SymbolicConstant DEFAULT specifying that the system will take the marker associated to each curve Possible values are:

- FILLED_CIRCLE
- FILLED_SQUARE
- FILLED_DIAMOND
- FILLED_TRI
- HOLLOW_CIRCLE
- HOLLOW_SQUARE
- HOLLOW_DIAMOND
- HOLLOW_TRI
- CROSS
- XMARKER
- DEFAULT

The default value is DEFAULT.

xySymbolSize

A SymbolicConstant specifying the size of the markers. Possible values are SMALL, MEDIUM, and LARGE. The default value is MEDIUM.

xySymbolColor A String specifying the color used to plot *X–Y* time tracker symbols when *xyUseHighlightMethod* = False. When setting the color to 'Default' the system will take the color associated to each curve. The default value is "Default".

Return value

`None.`

Exceptions

None.

Members

The AnimationOptions object can have the following members:

mode A SymbolicConstant specifying the animation mode. Possible values are PLAY_ONCE, LOOP, LOOP_BACKWARD, and SWING. The default value is LOOP.

frameRate An Int specifying the animation rate in frames/second. Possible values are 1 ≤*frameRate*≤ 100. The default value is 50.

frameCounter A Boolean specifying whether to show the frame counter. The default value is ON.

relativeScaling A SymbolicConstant specifying the relative scaling when the *AnimationController* object's *animationType*=SCALE_FACTOR or HARMONIC. Possible values are FULL_CYCLE and HALF_CYCLE. The default value is HALF_CYCLE.

numScaleFactorFrames An Int specifying the number of frames to be used when the *AnimationController* object's *animationType*=SCALE_FACTOR or HARMONIC. The default value is 7.

timeHistoryMode A SymbolicConstant specifying whether the time history animation is time based or frame based. Possible values are FRAME_BASED and TIME_BASED. The default value is FRAME_BASED.

maxTime A Float specifying the maximum time for time based time history animation when *maxTimeAutoCompute* = False.

maxTimeAutoCompute A Boolean specifying whether the animation maximum time value should be computed from the active frames when *timeHistoryMode* is set to TIME_BASED. The default value is ON.

maxTimeAutoValue A Float specifying the maximum time when *timeHistoryMode* is set to TIME_BASED and the *maxTimeAutoCompute* value is True. This value is computed as the maximum time of all active frames displayed in viewports where the animation is active.

minTime A Float specifying the minimum time for time based time history animation when *minTimeAutoCompute* = False.

minTimeAutoCompute

A Boolean specifying whether the animation minimum time value should be computed from the active frames when *timeHistoryMode* is set to TIME_BASED. The default value is ON.

minTimeAutoValue

A Float specifying the minimum time when *timeHistoryMode* is set to TIME_BASED and the *minTimeAutoCompute* value is True. This value is computed as the minimum time of all active frames displayed in viewports where the animation is active.

timeIncrement

A Float specifying the time increment for frame selection when *timeHistoryMode* is set to TIME_BASED.

xyUseHighlightMethod

A Boolean specifying whether to use the highlight method to draw the time tracker line and symbols. The default value is ON.

xyShowLine

A Boolean specifying whether to show the time tracker line. The default value is ON.

xyLineStyle

A SymbolicConstant specifying the *X–Y* time tracker line style. Possible values are SOLID, DASHED, DOTTED, and DOT_DASH. The default value is SOLID.

xyLineThickness

A SymbolicConstant specifying the *X–Y* time tracker line thickness. Possible values are VERY_THIN, THIN, MEDIUM, and THICK. The default value is MEDIUM.

xyShowSymbol

A Boolean specifying whether to show the time tracker symbols. The default value is ON.

xySymbolMarker

A SymbolicConstant specifying the marker type to be used for all animation capable *X–Y* curve or the SymbolicConstant DEFAULT specifying that the system will take the marker associated to each curve Possible values are:

- FILLED_CIRCLE
- FILLED_SQUARE
- FILLED_DIAMOND
- FILLED_TRI
- HOLLOW_CIRCLE
- HOLLOW_SQUARE
- HOLLOW_DIAMOND
- HOLLOW_TRI
- CROSS
- XMARKER
- DEFAULT

The default value is DEFAULT.

xySymbolSize

A SymbolicConstant specifying the size of the markers. Possible values are SMALL, MEDIUM, and LARGE. The default value is MEDIUM.

xyLineColor

A String specifying the color used to plot the *X–Y* time tracker line when *xyUseHighlightMethod* = False. The default value is "Yellow".

xySymbolColor

A String specifying the color used to plot *X–Y* time tracker symbols when *xyUseHighlightMethod* = False. When setting the color to 'Default' the system will take the color associated to each curve. The default value is "Default".

AVIOptions object

The AVIOptions object is used to store values and attributes to be used in generating AVI animation. The AVIOptions object has no constructor. Abaqus creates the *aviOptions* member when the animation module is imported.

Access

```
import animation
session.aviOptions
```

`setValues(...)`

This method modifies the AVIOptions object.

Required arguments

None.

Optional arguments

compressionMethod A SymbolicConstant specifying the compression method for the AVI format. Possible values are:

- RAW8, specifying an uncompressed format of 8 bits per pixel.
- RAW32, specifying an uncompressed format of 32 bits per pixel.
- RLE8, specifying a run length encoded format of 8 bits per pixel.
- CODEC, specifying a format defined by CODEC (encoder/decoder). The availability of the CODEC is system dependent

The default value is RLE8.

compressionQuality An Int specifying the quality of the compression as a percentage when the *compressionMethod* is set to CODEC.

codecOptions A String specifying the system specific options defining the CODEC when the *compressionMethod* is set to CODEC.

sizeDefinition A SymbolicConstant specifying how the width and height of the image are specified. Possible values are SIZE_ON_SCREEN and USER_DEFINED. The default value is SIZE_ON_SCREEN.

imageSize A pair of Ints specifying the width and height of the image in pixels when *sizeDefinition*=USER_DEFINED. Possible values are Ints in the range (*minWidth*, *minHeight*) $\leq$ (width, height) $\leq$ (*maxWidth*, *maxHeight*). The default value is the screen size.

Note:

The values of the minimum width (*minWidth*) and height (*minHeight*) depend on the following:

- viewport font size,
- whether decorations are printed,

- decoration size, and
- screen resolution.

The minimum width and height are normally < 50 pixels. The values of the maximum width (*maxWidth*) and height (*maxHeight*) depend on the graphics capabilities of the system. The maximum width and height will be at least as large as the screen dimensions.

Return value

`None.`

Exceptions

None.

Members

The AVIOptions object has members with the same names and descriptions as the arguments to the *setValues* method.

GIFOptions object

The GIFOptions object is used to store values and attributes to be used in generating animated GIF animations. The GIFOptions object has no constructor. Abaqus creates the *gifOptions* member when the animation module is imported.

Access

```
import animation
session.gifOptions
```

`setValues(...)`

This method modifies the GIFOptions object.

Required arguments

None.

Optional arguments

sizeDefinition A SymbolicConstant specifying how the width and height of the image are specified. Possible values are SIZE_ON_SCREEN and USER_DEFINED. The default value is SIZE_ON_SCREEN.

imageSize A pair of Ints specifying the width and height of the image in pixels when *sizeDefinition*=USER_DEFINED. Possible values are Ints in the range (*minWidth*, *minHeight*) (width, height) (*maxWidth*, *maxHeight*). The default value is the screen size.

Note: The values of the minimum width (*minWidth*) and height (*minHeight*) depend on the following:

- viewport font size,
- whether decorations are printed,
- decoration size, and
- screen resolution.

The minimum width and height are normally < 50 pixels. The values of the maximum width (*maxWidth*) and height (*maxHeight*) depend on the graphics capabilities of the system. The maximum width and height will be at least as large as the screen dimensions.

Return value

`None.`

Exceptions

None.

Members

The GIFOptions object has members with the same names and descriptions as the arguments to the `setValues` method.

ImageAnimationOptions object

The ImageAnimationOptions object is used to store values and attributes associated with saving viewport animations. The ImageAnimationOptions object has no constructor. Abaqus creates the *imageAnimationOptions* member when the animation module is imported.

Access

```
import animation
session.imageAnimationOptions
```

`setValues(...)`

This method modifies the ImageAnimationOptions object.

Required arguments

None.

Optional arguments

frameRate
An Int specifying the frame rate to record on the saved animation file. The effective frame rate in frames per second will be obtained by dividing the given frame rate by the time scale.

timeScale
An Int specifying the time scale to apply to the frame rate.

vpDecorations
A Boolean specifying whether to capture the viewport border and title. The default value is ON.

vpBackground
A Boolean specifying whether to capture viewport backgrounds. The default value is OFF.

compass
A Boolean specifying whether to capture the view compass. The default value is OFF.

Return value

`None.`

Exceptions

None.

Members

The ImageAnimationOptions object has members with the same names and descriptions as the arguments to the *setValues* method.

ImageAnimation object

The ImageAnimation object is used to build frame by frame animation.

Access

```
import animation
session.imageAnimation
```

ImageAnimation(...)

This method creates an ImageAnimation object from the specified filename and format.

Path

```
session.ImageAnimation
```

Required arguments

fileName	A String specifying the name of the animation file to generate.
format	A SymbolicConstant specifying the format of the generated file. Possible values are MP4, AVI, QUICKTIME, and GIF.

Optional arguments

None.

Return value

An ImageAnimation object.

Exceptions

None.

writeFrame(...)

This method adds a frame to the ImageAnimation object.

Required arguments

None.

Optional arguments

canvasObjects	A sequence specifying the canvas objects to capture. The default is to capture all canvas objects.

Return value

```
None.
```

Exceptions

None.

close()

This method closes the ImageAnimation object.

Arguments

None.

Return value

`None.`

Exceptions

None.

closed()

This method indicates if the ImageAnimation is open or closed for writing animation frames.

Arguments

None.

Return value

`None.`

Exceptions

None.

Members

The ImageAnimation object has the following member:

fileName A String specifying the file to which the animation frames is to be written.

QuickTimeOptions object

The QuickTimeOptions object is used to store values and attributes to be used in generating QuickTime animation. The QuickTimeOptions object has no constructor. Abaqus creates the *quickTimeOptions* member when the animation module is imported.

Access

```
import animation
session.quickTimeOptions
```

`setValues(...)`

This method modifies the QuickTimeOptions object.

Required arguments

None.

Optional arguments

compressionMethod A SymbolicConstant specifying the compression method for the QuickTime format. Possible values are:

- RAW24, specifying an uncompressed format of 24 bits per pixel.
- RLE24, specifying a run length encoded format of 24 bits per pixel.

The default value is RLE24.

sizeDefinition A SymbolicConstant specifying how the width and height of the image are specified. Possible values are SIZE_ON_SCREEN and USER_DEFINED. The default value is SIZE_ON_SCREEN.

imageSize A pair of Ints specifying the width and height of the image in pixels when *sizeDefinition*=USER_DEFINED. Possible values are Ints in the range (*minWidth*, *minHeight*) $\leq$ (width, height) $\leq$ (*maxWidth*, *maxHeight*). The default value is the screen size.

Note:

The values of the minimum width (*minWidth*) and height (*minHeight*) depend on the following:

- viewport font size,
- whether decorations are printed,
- decoration size, and
- screen resolution.

The minimum width and height are normally < 50 pixels. The values of the maximum width (*maxWidth*) and height (*maxHeight*) depend on the graphics capabilities of the system. The maximum width and height will be at least as large as the screen dimensions.

Return value
`None.`

Exceptions
None.

Members
The QuickTimeOptions object has members with the same names and descriptions as the arguments to the *`setValues`* method.

MP4Options object

The MP4Options object is used to store values and attributes to be used in generating MP4 animations.
The MP4Options object has no constructor. Abaqus creates the *mp4Options* member when the animation module is imported.

Access

```
import animation
session.mp4Options
```

`setValues(...)`

This method modifies the MP4Options object.

Required arguments

None.

Optional arguments

compressionQuality An Int specifying the quality of the compression as a percentage. The default is 75.

codecOptions A String specifying the codec implementation. Possible values are "mpeg4" and, if an appropriate FFmpeg installation can be found that supports it, "libx264." The default is "libx264" when available.

sizeDefinition A SymbolicConstant specifying how the width and height of the image are specified. Possible values are SIZE_ON_SCREEN and USER_DEFINED. The default value is SIZE_ON_SCREEN.

imageSize A pair of Ints specifying the width and height of the image in pixels when *sizeDefinition*=USER_DEFINED. Possible values are Ints in the range (*minWidth*, *minHeight*) (width, height) (*maxWidth*, *maxHeight*). The default value is the screen size.

Note: The values of the minimum width (*minWidth*) and height (*minHeight*) depend on the following:

- viewport font size,
- whether decorations are printed,
- decoration size, and
- screen resolution.

The minimum width and height are normally < 50 pixels. The values of the maximum width (*maxWidth*) and height (*maxHeight*) depend on the graphics capabilities of the system. The maximum width and height will be at least as large as the screen dimensions.

Return value

`None.`

Exceptions

None.

Members

The MP4Options object has members with the same names and descriptions as the arguments to the *setValues* method.

Movie object

The Movie object is used to store values and attributes associated with a movie file. Upon creation, the Movie object is added to the session.movies repository.

Access

```
import animation
session.movies[name]
```

Movie(...)

This method creates a Movie object from the contents of the specified file.

Path

```
session.Movie
```

Required arguments

name
A String specifying the repository name for the movie.

fileName
A String specifying the file from which the movie is to be read. The file extension must be specified and indicates the movie format (for example, `.mp4`, `.avi`, etc.).

Optional arguments

startFrame
An Int specifying the first frame to be displayed from this movie. The default value is 0.

endFrame
An Int specifying the last frame to be displayed from this movie. A negative number will indicate reverse numbering: -1 is the last frame of the movie. The default value is −1.

timelineStartFrame
An Int specifying the global timeline frame number that corresponds to *startFrame*. A value of 0 will indicate the first frame to be displayed in the viewport. The default value is 0.

timelineEndFrame
An Int specifying the global timeline frame number that corresponds to *endFrame*. A negative number will indicate reverse numbering: -1 indicates the last frame to be displayed in the viewport. The default value is −1.

timelineStartTime
A Float specifying the global timeline time that corresponds to the time of *startFrame*. The default value is 0.0.

timelineEndTime
The SymbolicConstant END_FRAME_TIME or a Float specifying the global timeline time that corresponds to the time of *endFrame*. The SymbolicConstant END_FRAME_TIME indicates the time in this movie corresponding to *endFrame*. The default value is END_FRAME_TIME.

Return value

A Movie object.

Exceptions

ValueError.

If *fileName* does not exist or can not be read:	ValueError: Unable to open movie file
If *fileName* references an unsupported movie file format:	ValueError: Unsupported movie format
If the contents of *fileName* are corrupt or can not be decoded:	ValueError: Unable to decode movie file

`setValues(...)`

This method modifies the Movie object.

Required arguments

None.

Optional arguments

startFrame	An Int specifying the first frame to be displayed from this movie. The default value is 0.
endFrame	An Int specifying the last frame to be displayed from this movie. A negative number will indicate reverse numbering: -1 is the last frame of the movie. The default value is −1.
timelineStartFrame	An Int specifying the global timeline frame number that corresponds to *startFrame*. A value of 0 will indicate the first frame to be displayed in the viewport. The default value is 0.
timelineEndFrame	An Int specifying the global timeline frame number that corresponds to *endFrame*. A negative number will indicate reverse numbering: -1 indicates the last frame to be displayed in the viewport. The default value is −1.
timelineStartTime	A Float specifying the global timeline time that corresponds to the time of *startFrame*. The default value is 0.0.
timelineEndTime	The SymbolicConstant END_FRAME_TIME or a Float specifying the global timeline time that corresponds to the time of *endFrame*. The SymbolicConstant END_FRAME_TIME indicates the time in this movie corresponding to *endFrame*. The default value is END_FRAME_TIME.

Return value

`None.`

Exceptions

RangeError.

If *startFrame*, *endFrame*, *timelineStartFrame*, *timelineEndFrame*, *timelineStartTime*, or *timelineEndTime* are outside their respective valid range.	RangeError: startFrame must be an Integer in the range: 0 to numFrames-1

Members

The Movie object has members with the same names and descriptions as the arguments to the *Movie* method.

In addition, the Movie object has the following members:

width	An Int specifying the width of the movie in pixels.
height	An Int specifying the height of the movie in pixels.
numFrames	An Int specifying the total number of frames on the movie file.
duration	A Float specifying the duration of the movie in seconds.
memory	An Int specifying the memory taken by the movie frames as selected.

Session object

The following commands operate on Session objects. For more information about the Session object, see *Session object*.

Access

```
import animation
```

`writeImageAnimation(...)`

This method writes the animations present in the list of canvas objects to a file. It generates an animation file using the given file name and file format and uses the values in the appropriate options object.

Required arguments

fileName A String specifying the name of the animation file to generate.

format A SymbolicConstant specifying the format of the generated file. Possible values are MP4, AVI, QUICKTIME, GIF, VRML, and COMPRESSED_VRML.

Optional arguments

canvasObjects A sequence specifying the canvas objects to capture. The default behavior is to capture all canvas objects.

Return value

`None.`

Exceptions

None.

Annotation commands

Annotation commands are used to create, position, and modify viewport annotations.

In this section:

- *Annotation object*
- *AnnotationsToPlotArray object*
- *Arrow object*
- *Text object*
- *Viewport object*

Annotation object

The Annotation object is the abstract base type for other Annotation objects. The Annotation object has no explicit constructor. The methods and members of the Annotation object are common to all objects derived from Annotation.

Access

```
import annotationToolset
mdb.annotations[name]
session.odbs[name].userData.annotations[name]
session.viewports[name].annotationsToPlot[i]
```

bringToFront()

This method brings the Annotation object to the top of the annotation stack.

Arguments

None.

Return value

None.

Exceptions

None.

sendToBack()

This method sends the Annotation object to the bottom of the annotation stack.

Arguments

None.

Return value

None.

Exceptions

None.

bringForward()

This method brings the Annotation object one position up in the annotation stack.

Arguments

None.

Return value

None.

Exceptions

None.

sendBackward()

This method sends the Annotation object one position down in the annotation stack.

Arguments

None.

Return value

`None.`

Exceptions

None.

moveBefore(...)

This method moves the Annotation object before another object in the same repository.

Required arguments

name A String specifying the name of the other Annotation object.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

moveAfter(...)

This method moves the Annotation object after another object in the same repository.

Required arguments

name A String specifying the name of the other Annotation object.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

translate(...)

This method translates the Annotation object on the viewport plane.

Required arguments

None.

Optional arguments

x A Float specifying the *X* translation amount in millimeters.

y A Float specifying the *Y* translation amount in millimeters.

Return value

`None`.

Exceptions

None.

Members

The Annotation object has the following member:

name A String specifying the annotation repository key.

AnnotationsToPlotArray object

The AnnotationsToPlotArray object is a sequence that stores references to plotted annotations. By adding annotations to and removing annotations from this sequence, you can control which annotations are displayed in a particular viewport.

Access

```
import annotationToolset
session.viewports[name].annotationsToPlot
```

bringForward(...)

This method brings the *Annotation* object one position forward in the AnnotationsToPlotArray sequence.

Required arguments

index An Int specifying the index of the *Annotation* object in the AnnotationsToPlotArray sequence.

Optional arguments

None.

Return value

None.

Exceptions

None.

bringToFront(...)

This method brings the *Annotation* object to the beginning of the AnnotationsToPlotArray sequence.

Required arguments

index An Int specifying the index of the *Annotation* object in the AnnotationsToPlotArray sequence.

Optional arguments

None.

Return value

None.

Exceptions

None.

moveAfter(...)

This method moves the *Annotation* object after another object in the same AnnotationsToPlotArray sequence.

Required arguments

index
An Integer specifying the index of the *Annotation* object in the AnnotationsToPlotArray sequence.

other
An Integer specifying the index of the other *Annotation* object in the AnnotationsToPlotArray sequence after which this object will be moved.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

moveBefore(...)

This method moves the *Annotation* object before another object in the same AnnotationsToPlotArray sequence.

Required arguments

index
An Int specifying the index of the *Annotation* object in the AnnotationsToPlotArray sequence.

other
An Int specifying the index of the other *Annotation* object in the AnnotationsToPlotArray sequence before which this object will be moved.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

sendBackward(...)

This method sends the *Annotation* object one position backward in the AnnotationsToPlotArray sequence.

Required arguments

index An Int specifying the index of the *Annotation* object in the AnnotationsToPlotArray sequence.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`sendToBack(...)`

This method sends the *Annotation* object to the end of the AnnotationsToPlotArray sequence.

Required arguments

index An Int specifying the index of the *Annotation* object in the AnnotationsToPlotArray sequence.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

Members

The AnnotationsToPlotArray object has no members.

Arrow object

The Arrow object stores the visual settings and location of an arrow annotation.

The Arrow object is derived from the *Annotation* object.

Access

```
import annotationToolset
mdb.annotations[name]
session.odbs[name].userData.annotations[name]
session.viewports[name].annotationsToPlot[i]
```

Arrow(...)

This method creates an Arrow object.

Path

mdb.Arrow

session.odbs[*name*].userData.Arrow

Required arguments

name
A String specifying the annotation repository key.

Optional arguments

startPoint
A pair of Floats specifying the start point *X*- and *Y*-offsets in millimeters from *startAnchor*. The default value is (0, 0).

endPoint
A pair of Floats specifying the end point *X*- and *Y*-offsets in millimeters from *endAnchor*. The default value is (0, 0).

startAnchor
A SymbolicConstant or a sequence of Floats specifying a point. A sequence of two Floats specifies the *X*- and *Y*-coordinates as percentages of the viewport width and height. A sequence of three Floats specifies the *X*-, *Y*-, and *Z*-coordinates of a point in the model coordinate system. A SymbolicConstant indicates a relative position. Possible values are:

- BOTTOM_LEFT
- BOTTOM_CENTER
- BOTTOM_RIGHT
- CENTER_LEFT
- CENTER
- CENTER_RIGHT
- TOP_LEFT
- TOP_CENTER
- TOP_RIGHT

The default value is BOTTOM_LEFT.

endAnchor

A SymbolicConstant or a sequence of Floats specifying a point. A sequence of two Floats specifies the *X*- and *Y*-coordinates as percentages of the viewport width and height. A Sequence of three Floats specifies the *X*-, *Y*-, and *Z*-coordinates of a point in the model coordinate system. A SymbolicConstant indicates a relative position. Possible values are:

- BOTTOM_LEFT
- BOTTOM_CENTER
- BOTTOM_RIGHT
- CENTER_LEFT
- CENTER
- CENTER_RIGHT
- TOP_LEFT
- TOP_CENTER
- TOP_RIGHT

The default value is BOTTOM_LEFT.

startHeadStyle

A SymbolicConstant specifying the style of the start head. Possible values are:

- ARROW
- FILLED_ARROW
- HOLLOW_CIRCLE
- FILLED_CIRCLE
- HOLLOW_DIAMOND
- FILLED_DIAMOND
- HOLLOW_SQUARE
- FILLED_SQUARE
- NONE

The default value is NONE.

endHeadStyle

A SymbolicConstant specifying the style of the end head. Possible values are:

- ARROW
- FILLED_ARROW
- HOLLOW_ CIRCLE
- FILLED_CIRCLE
- HOLLOW_DIAMOND
- FILLED_DIAMOND
- HOLLOW_SQUARE
- FILLED_SQUARE
- NONE

The default value is FILLED_ARROW.

startGap A Float specifying the distance in millimeters between the arrow start point and the arrow start head. The default value is 0.0.

endGap A Float specifying the distance in millimeters between the arrow end point and the arrow end head. The default value is 0.0.

color A String specifying the color of the arrow. Possible string values are any valid color. The default value is "White".

lineStyle A SymbolicConstant specifying the line style of the arrow. Possible values are SOLID, DASHED, DOTTED, and DOT_DASH. The default value is SOLID.

lineThickness A SymbolicConstant specifying the line thickness of the arrow. Possible values are VERY_THIN, THIN, MEDIUM, and THICK. The default value is VERY_THIN.

Return value

An Arrow object.

Exceptions

InvalidNameError.

translateStartPoint(...)

This method translates the start point of the Arrow object on the viewport plane.

Required arguments

None.

Optional arguments

x A Float specifying the *X* translation amount in millimeters.

y A Float specifying the*Y* translation amount in millimeters.

Return value

`None.`

Exceptions

None.

translateEndPoint(...)

This method translates the end point of the Arrow object on the viewport plane.

Required arguments

None.

Optional arguments

x A Float specifying the *X* translation amount in millimeters.

y A Float specifying the*Y* translation amount in millimeters.

Return value

`None.`

Exceptions

None.

`setValues(...)`

This method modifies the Arrow object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Arrow* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The Arrow object has members with the same names and descriptions as the arguments to the *Arrow* method.

Text object

The Text object stores the text settings and location of a text annotation.

The Text object is derived from the *Annotation* object.

Access

```
import annotationToolset
mdb.annotations[name]
session.odbs[name].userData.annotations[name]
session.viewports[name].annotationsToPlot[i]
```

Text(...)

This method creates a Text object.

Path

mdb.Text

session.odbs[*name*].userData.Text

Required arguments

name
A String specifying the annotation repository key.

Optional arguments

text
A String specifying the text of the Text object. The default value is an empty string.

offset
A pair of Floats specifying the *X*- and *Y*-offsets in millimeters of the Text object from *anchor*. The default value is (0, 0).

anchor
A SymbolicConstant or a sequence of Floats specifying a point. A sequence of two Floats specifies the *X*- and *Y* coordinates as percentages of the viewport width and height. A Sequence of three Floats specifies the *X*-, *Y*-, and *Z*-coordinates of a point in the model coordinate system. A SymbolicConstant specifies a relative position. Possible values are:

- BOTTOM_LEFT
- BOTTOM_CENTER
- BOTTOM_RIGHT
- CENTER_LEFT
- CENTER
- CENTER_RIGHT
- TOP_LEFT
- TOP_CENTER
- TOP_RIGHT

The default value is BOTTOM_LEFT.

referencePoint

A SymbolicConstant or a sequence of Floats specifying a point. The sequence of two Floats specifies the *X*- and *Y*-coordinates of the reference point of the Text annotation given as percentages of its width and height. The SymbolicConstant indicates a relative position. Possible values are:

- BOTTOM_LEFT
- BOTTOM_CENTER
- BOTTOM_RIGHT
- CENTER_LEFT
- CENTER
- CENTER_RIGHT
- TOP_LEFT
- TOP_CENTER
- TOP_RIGHT

The default value is BOTTOM_LEFT.

rotationAngle

A Float specifying the amount of rotation in degrees about *referencePoint*. The default value is 0.0.

color

A String specifying the color of the Text object. Possible string values are any valid color. The default value is "White".

font

A String specifying the font of the Text object. Possible string values are any valid font specification. The default value is "-*-verdana-medium-r-normal--120-*".

backgroundStyle

A SymbolicConstant specifying the Text object background style. Possible values are MATCH, TRANSPARENT, and OTHER. The default value is TRANSPARENT.

backgroundColor

A String specifying the color of the Text object background. Possible string values are any valid color. The default value matches the viewport background.

box

A Boolean specifying whether the box around the text is shown. The default value is OFF.

justification

A SymbolicConstant specifying the Text object justification for multiline text. Possible values are JUSTIFY_LEFT, JUSTIFY_CENTER, and JUSTIFY_RIGHT. The default value is JUSTIFY_LEFT.

Return value

A Text object.

Exceptions

None.

setValues(...)

This method modifies the Text object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Text* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The Text object has members with the same names and descriptions as the arguments to the *Text* method.

In addition, the Text object has the following members:

width A Float specifying the width in millimeters of the Text object.

height A Float specifying the height in millimeters of the Text object.

Viewport object

The following commands operate on Viewport objects. For more information about the Viewport object, see *Viewport object*.

Access

```
import annotationToolset
```

`plotAnnotation(...)`

This method plots an *Annotation* object in aViewport.

Required arguments

annotation
An *Annotation* object to plot.

Optional arguments

index
An Int specifying the index of the *Annotation* object in the sequence of annotations to plot. The default value is zero.

Return value

`None.`

Exceptions

None.

Assembly commands

Features in Abaqus/CAE include Parts, Datums, Partitions, and Assembly operations.
Assembly commands create Feature objects on only the *rootAssembly* object. The commands that create Feature objects on only the Part object are described in *Part commands*. The commands that create Feature objects on both the Part and the *rootAssembly* objects are described in *Feature commands*.

In this section:

- *Assembly object*
- *ConnectorOrientation object*
- *Feature object*
- *PartInstance object*
- *ModelInstance object*
- *Model object*

Assembly object

An Assembly object is a container for instances of parts.
The Assembly object has no constructor command. Abaqus creates the *rootAssembly* member when a *Model* object is created.

Access

```
import assembly
mdb.models[name].rootAssembly
```

backup()

This method makes a backup copy of the features in the assembly. The `backup()` method is used in conjunction with the `restore()` method.

Arguments

None.

Return value

`None.`

Exceptions

None.

clearGeometryCache()

This method deletes the geometry cache. Deleting the geometry cache reduces the amount of memory being used.

Arguments

None.

Return value

`None.`

Exceptions

None.

deleteAllFeatures()

This method deletes all the features in the assembly.

Arguments

None.

Return value

`None.`

Exceptions

None.

deleteFeatures(...)

This method deletes specified features from the assembly.

Required arguments

featureNames A sequence of Strings specifying the feature names that will be deleted from the assembly.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

excludeFromSimulation(...)

This method excludes the specified part instances from the analysis.

Required arguments

instances A sequence of *PartInstance* objects to be excluded from the analysis.

exclude A Bool specifying whether to exclude the selected instances from the analysis or include them.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

featurelistInfo()

This method prints the name and status of all the features in the feature lists.

Arguments

None.

Return value

`None.`

Exceptions

None.

`getMassProperties(...)`

This method returns the mass properties of the assembly, or instances or regions. Only beams, trusses, shells, solids, point, nonstructural mass, and rotary inertia elements are supported.

Required arguments

None.

Optional arguments

regions
A MeshElementArray, CellArray, FaceArray, EdgeArray, or list of PartInstance objects specifying the regions whose mass properties are to be queried. The whole assembly is queried by default.

relativeAccuracy
A SymbolicConstant specifying the relative accuracy for geometry computation. Possible values are LOW, MEDIUM, and HIGH. The default value is LOW.

useMesh
A Boolean specifying whether the mesh should be used in the computation if the geometry is meshed. The default value is False.

specifyDensity
A Boolean specifying whether a user-specified density should be used in regions with density errors such as undefined material density. The default value is False.

density
A double value specifying the user-specified density value to be used in regions with density errors. The user-specified density should be greater than 0.

specifyThickness
A Boolean specifying whether a user-specified thickness should be used in regions with thickness errors such as undefined thickness. The default value is False.

thickness
A double value specifying the user-specified thickness value to be used in regions with thickness errors. The user-specified thickness should be greater than 0.

miAboutCenterOfMass
A Boolean specifying if the moments of inertia should be evaluated about the center of mass. The default value is True.

miAboutPoint
A tuple of three floats specifying the coordinates of the point about which to evaluate the moment of inertia. By default if the moments of inertia are not being evaluated about the center of mass, they will be evaluated about the origin.

Return value

A Dictionary object with the following items:

area: None or a Float specifying the sum of the area of the specified faces. The area is computed only for one side for shells.

areaCentroid: None or a tuple of three Floats representing the coordinates of the area centroid.

volume: None or a Float specifying the volume of the specified regions.

volumeCentroid: None or a tuple of three Floats representing the coordinates of the volume centroid.

massFromMassPerUnitSurfaceArea: None or a Float specifying the mass due to mass per unit surface area.

mass: None or a Float specifying the mass of the specified regions. It is the total mass and includes mass from quantities such as mass per unit surface area.

centerOfMass: None or a tuple of three Floats representing the coordinates of the center of mass.

momentOfInertia: None or a tuple of six Floats representing the moments of inertia about the center of mass or about the point specified.

warnings: A tuple of SymbolicConstants representing the problems encountered while computing the mass properties. Possible SymbolicConstants are:

UNSUPPORTED_ENTITIES: Some unsupported entities exist in the specified regions. The mass properties are computed only for beams, trusses, shells, solids, point and nonstructural mass elements, and rotary inertia elements. The mass properties are not computed for axisymmetric elements, springs, connectors, gaskets, or any other elements.

MISSING_THICKNESS: For some regions, the section definitions are missing thickness values.

ZERO_THICKNESS: For some regions, the section definitions have a zero thickness value.

VARIABLE_THICKNESS: The nodal thickness or field thickness specified for some regions has been ignored.

NON_APPLICABLE_THICKNESS: For some regions, the thickness value is not applicable to the corresponding sections specified on the regions.

MISSING_DENSITY: For some regions, the section definitions are missing material density values.

MISSING_MATERIAL_DEFINITION: For some regions, the material definition is missing.

ZERO_DENSITY: For some regions, the section definitions have a zero material density value.

UNSUPPORTED_DENSITY: For some regions, either a negative material density or a temperature-dependent density has been specified, or the material value is missing for one or more plies in the composite section.

SHELL_OFFSETS: For shells, this method does not account for any offsets specified.

MISSING_SECTION_DEFINITION: For some regions, the section definition is missing.

UNSUPPORTED_SECTION_DEFINITION: The section definition provided for some regions is not supported.

REINFORCEMENTS: This method does not account for any reinforcements specified on the model.

SMEARED_PROPERTIES: For regions with composite section assignments, the density is smeared across the thickness. The volume centroid and center of mass computations for a composite shell use a lumped mass approach where the volume and mass is assumed to be lumped in the plane of the shell. As a result of these approximations the volume centroid, center of mass and moments of inertia might be slightly inaccurate for regions with composite section assignments.

UNSUPPORTED_NON_STRUCTURAL_MASS_ENTITIES: This method does not account for any nonstructural mass on wires.

INCORRECT_MOMENT_OF_INERTIA: For geometry regions with nonstructural mass per volume, the nonstructural mass is assumed to be a point mass at the centroid of the regions. Thus, the moments of inertia might be inaccurate as

the distribution of the nonstructural mass is not accounted for. Use the mesh for accurately computing the moments of inertia.

MISSING_BEAM_ORIENTATIONS: For some regions with beam section assignments, the beam section orientations are missing.

UNSUPPORTED_BEAM_PROFILES: This method supports the Box, Pipe, Circular, Rectangular, Hexagonal, Trapezoidal, I, L, T, Arbitrary, and Tapered beam profiles. Any other beam profile is not supported.

TAPERED_BEAM_MI: Moment of inertia calculations for tapered beams are not accurate.

SUBSTRUCTURE_INCORRECT_PROPERTIES: The user assigned density and thickness is not considered for substructures.

Exceptions

None.

`getAngle(...)`

This method returns the angle between the specified entities.

Required arguments

plane1
A *Face*, *MeshFace*, or a *Datum* object specifying the first plane. The *Datum* object must represent a datum plane. The *plane1* and *line1* arguments are mutually exclusive. One of them must be specified.

plane2
A *Face*, *MeshFace*, or a *Datum* object specifying the second plane. The *Datum* object must represent a datum plane. The *plane2* and *line2* arguments are mutually exclusive. One of them must be specified.

line1
An *Edge*, *MeshEdge*, or a *Datum* object specifying the first curve. The *Datum* object must represent a datum axis. The *plane1* and *line1* arguments are mutually exclusive. One of them must be specified.

line2
An *Edge*, *MeshEdge*, or a *Datum* object specifying the second curve. The *Datum* object must represent a datum axis. The *plane2* and *line2* arguments are mutually exclusive. One of them must be specified.

Optional arguments

commonVertex
If the two selected *Edge* objects have more than one vertex in common, this *Vertex* object specifies the vertex at which to evaluate the angle.

Return value

A Float specifying the angle between the specified entities. If you provide a plane as an argument, Abaqus/CAE computes the angle using the normal to the plane.

Exceptions

None.

`getCoordinates(...)`

This method returns the coordinates of a specified point.

Required arguments

entity A *Vertex*, *Datum* point, *MeshNode*, or *ReferencePoint* specifying the entity to query.

Optional arguments

csys A *DatumCsys* object specifying the desired coordinate system of the returned coordinates. By default, coordinates are given in the global coordinate system.

Return value

A tuple of three Floats representing the coordinates of the specified point.

Exceptions

None.

`getDistance(...)`

Depending on the arguments provided, this method returns one of the following:

- The distance between two points.
- The minimum distance between a point and an edge.
- The minimum distance between two edges.

Required arguments

entity1 A *Vertex*, *Datum* point, *MeshNode*, or *Edge* specifying the first entity from which to measure.

entity2 A *Vertex*, *Datum* point, *MeshNode*, or *Edge* specifying the second entity to which to measure.

Optional arguments

printResults A Boolean that determines whether a verbose output is to be printed. The default is True

Return value

A Float specifying the calculated distance.

Exceptions

None.

getFacesAndVerticesOfAttachmentLines(...)

Given an array of edge objects, this method returns a tuple of dictionary objects. Each object consists of five members including the attachment line and associated face and vertex objects.

Required arguments

edges An *EdgeArray* object that is a sequence of *Edge* objects.

Optional arguments

None.

Return value

A tuple of dictionary objects. Each dictionary contains five items with the following keys:

edge: An *Edge* object specifying the attachment line.

startFace: A *Face* object specifying the face associated with one end of the attachment line.

endFace: A *Face* object specifying the face associated with the other end of the attachment line.

startVertex: A *Vertex* object specifying the vertex associated with one end of the attachment line. This end is also associated with the startFace.

endVertex: A *Vertex* object specifying the vertex associated with the other end of the attachment line. This end is also associated with the endFace.

Exceptions

None.

getSurfaceSections(...)

This method returns a list of the sections assigned to the regions encompassed by the specified surface.

Required arguments

surface A string specifying the Surface name.

Optional arguments

None.

Return value

A tuple of strings representing the section names. If no section names are found, the tuple will contain one empty string.

Exceptions

None.

importEafFile(...)

This method imports an assembly from an EAF file into the root assembly.

Required arguments

filename
A String specifying the path to the EAF file from which to import the assembly.

Optional arguments

You use the following optional argument only to import specific instances and their associated parts.

ids
A sequence of Ints. Each Int in the sequence is a unique identifier of the occurrence in the assembly tree or component identifier associated with the part in the EAF file. If *ids* is an empty sequence, all occurrences or parts will be imported. The default value is an empty sequence.

Return value

`None.`

Exceptions

None.

importParasolidFile(...)

This method imports an assembly from the Parasolid file into the root assembly.

Required arguments

filename
A String specifying the path to a Parasolid file from which to import the assembly.

Optional arguments

You use the following optional argument only to import specific instances and their associated parts.

ids
A sequence of Ints. Each Int in the sequence is a unique identifier of the occurrence in the assembly tree or component identifier associated with the part in the EAF file. If *ids* is an empty sequence, all occurrences or parts will be imported. The default value is an empty sequence.

Return value

`None.`

Exceptions

None.

importCatiaV5File(...)

This method imports an assembly from a CATIA V5 Elysium Neutral file into the root assembly.

Required arguments

filename A String specifying the path to the CATIA V5 Elysium Neutral file from which to import the assembly.

Optional arguments

You use the following optional argument only to import specific instances and their associated parts.

ids A sequence of Ints. Each Int in the sequence is a unique identifier of the occurrence in the assembly tree or component identifier associated with the part in the EAF file. If *ids* is an empty sequence, all occurrences or parts will be imported. The default value is an empty sequence.

Return value

`None.`

Exceptions

None.

`importEnfFile(...)`

This method imports an assembly from an Elysium Neutral file created by Pro/ENGINEER, I-DEAS, or CATIA V5 into the root assembly.

Required arguments

filename A String specifying the path to the Elysium Neutral file from which to import the assembly.

Optional arguments

You use the following optional argument only to import specific instances and their associated parts.

ids A sequence of Ints. Each Int in the sequence is a unique identifier of the occurrence in the assembly tree or component identifier associated with the part in the EAF file. If *ids* is an empty sequence, all occurrences or parts will be imported. The default value is an empty sequence.

Return value

`None.`

Exceptions

None.

`importIdeasFile(...)`

This method imports an assembly from an I-DEAS Elysium Neutral file into the root assembly.

Required arguments

filename
A String specifying the path to the I-DEAS Elysium Neutral file from which to import the assembly.

Optional arguments

You use the following optional argument only to import specific instances and their associated parts.

ids
A sequence of Ints. Each Int in the sequence is a unique identifier of the occurrence in the assembly tree or component identifier associated with the part in the EAF file. If *ids* is an empty sequence, all occurrences or parts will be imported. The default value is an empty sequence.

Return value

`None.`

Exceptions

None.

`importProEFile(...)`

This method imports an assembly from a Pro/ENGINEER Elysium Neutral file into the root assembly.

Required arguments

filename
A String specifying the path to the Pro/ENGINEER Elysium Neutral file from which to import the assembly.

Optional arguments

You use the following optional argument only to import specific instances and their associated parts.

ids
A sequence of Ints. Each Int in the sequence is a unique identifier of the occurrence in the assembly tree or component identifier associated with the part in the EAF file. If *ids* is an empty sequence, all occurrences or parts will be imported. The default value is an empty sequence.

Return value

`None.`

Exceptions

None.

`makeDependent(...)`

This method converts the specified part instances from independent to dependent part instances.

Required arguments

instances	A sequence of *PartInstance* objects to convert to dependent part instances.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`makeIndependent(...)`

This method converts the specified part instances from dependent to independent part instances.

Required arguments

instances	A sequence of *PartInstance* objects to convert to independent part instances.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`printAssignedSections()`

This method prints a summary of assigned connector sections.

Arguments

None.

Return value

`None.`

Exceptions

None.

`printConnectorOrientations()`

This method prints a summary of connector orientations.

Arguments

None.

Return value

```
None.
```

Exceptions

None.

projectReferencesOntoSketch(...)

This method projects the specified edges, vertices, and datum points from the assembly onto the specified *ConstrainedSketch* object. The edges, vertices, and datum points appear on the sketch as reference geometry.

Required arguments

sketch The *ConstrainedSketch* object on which the edges, vertices, and datum points are projected.

Optional arguments

filter A SymbolicConstant specifying how to limit the amount of projection. Possible values are ALL_EDGES and COPLANAR_EDGES. If *filter*=COPLANAR_EDGES, edges that are coplanar to the sketching plane are the only candidates for projection. The default value is ALL_EDGES.

upToFeature A Feature object specifying a marker in the feature-based history of the part. Abaqus/CAE projects onto the sketch only the part entities that were created before the feature specified by this marker. By default, all part entities are candidates for projection.

edges A sequence of candidate edges to be projected onto the sketch. By default, all edges are candidates for projection.

vertices A sequence of candidate vertices to be projected onto the sketch. By default, all vertices are candidates for projection.

Return value

```
None.
```

Exceptions

None.

queryCachedStates()

This method displays the position of geometric states relative to the sequence of features in the assembly cache. The output is displayed in the message area.

Arguments

None.

Return value
`None.`

Exceptions

None.

`regenerate()`

This method regenerates the assembly and brings it up to date with the latest values of the assembly parameters. When you modify features of an assembly, it might be convenient to postpone regeneration until you make all your changes, since regeneration can be time consuming. In contrast, when you modify features of a part that is included in the assembly, you should use this command to regenerate the assembly. When you regenerate the assembly, it will reflect the changes that you made to the part.

Arguments

None.

Return value
`None.`

Exceptions

None.

`regenerationWarnings()`

This method prints any regeneration warnings associated with the features.

Arguments

None.

Return value
`None.`

Exceptions

None.

`restore()`

This method restores the parameters of all features in the assembly to the value they had before a failed regeneration. Use the `restore` method after a failed regeneration, followed by a `regenerate` command.

Arguments

None.

Return value
`None.`

Exceptions

None.

resumeAllFeatures()

This method resumes all the suppressed features in the part or assembly.

Arguments

None.

Return value

`None.`

Exceptions

None.

resumeFeatures(...)

This method resumes the specified suppressed features in the assembly.

Required arguments

featureNames	A sequence of Strings specifying the names of features to resume.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

resumeLastSetFeatures()

This method resumes the last set of features to be suppressed in the assembly.

Arguments

None.

Return value

`None.`

Exceptions

None.

rotate(...)

This method rotates given instances by the specified amount.

Required arguments

instanceList	A sequence of Strings specifying the names of instances to rotate.
axisPoint	A sequence of three Floats specifying the coordinates of a point on the axis.
axisDirection	A sequence of three Floats specifying the direction of the axis.
angle	A Float specifying the rotation angle in degrees. Use the right-hand rule to determine the direction.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

translate(...)

This method translates given instances by the specified amount.

Required arguments

instanceList	A sequence of Strings specifying the names of instances to translate.
vector	A sequence of three Floats specifying a translation vector.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

saveGeometryCache()

This method caches the current geometry, which improves regeneration performance.

Arguments

None.

Return value

```
None.
```

Exceptions

None.

setValues(...)

This method modifies the behavior associated with the specified assembly.

Required arguments

regenerateConstraintsTogether A Boolean specifying whether the positioning constraints in the assembly should be regenerated together before regenerating other assembly features. The default value is ON.

If the assembly has position constraint features and you modify the value of *regenerateConstraintsTogether*, Abaqus/CAE will regenerate the assembly features.

Optional arguments

None.

Return value

```
None.
```

Exceptions

If one or more features in the assembly fails to regenerate: FeatureError: Regeneration failed

suppressFeatures(...)

This method suppresses specified features.

Required arguments

featureNames A sequence of Strings specifying the names of features to suppress in the assembly.

Optional arguments

None.

Return value

```
None.
```

Exceptions

None.

`unlinkInstances(...)`

This method converts the specified *PartInstance* objects from linked child instances to regular instances. The parts associated with the selected instances will be converted to regular parts as well.

Required arguments

instances
A sequence of *PartInstance* objects to be converted to regular part instances.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`writeAcisFile(...)`

This method exports the assembly to a named file in ACIS part (SAT) or assembly (ASAT) format.

Required arguments

fileName
A String specifying the name of the file to which to write. The file name's extension is used to determine whether a part or assembly is written. Use the file extension `.asat` for the assembly format.

Optional arguments

version
A Float specifying the ACIS version. For example, the Float "12.0" corresponds to ACIS Version 12.0. The default value is the current version of ACIS.

Return value

`None.`

Exceptions

None.

`writeCADParameters(...)`

This method writes the parameters that were imported from the CAD system to a parameter file.

Required arguments

paramFile
A String specifying the parameter file name.

Optional arguments

modifiedParams
A tuple of tuples each containing the part name, the parameter name, and the modified parameter value. Default is an empty tuple.

updatePaths
A Bool specifying whether to update the path of the CAD model file specified in the *parameterFile* to the current directory, if the CAD model is present in the current directory.

Return value
`None.`

Exceptions
None.

`lock()`

This method locks the assembly. Locking the assembly prevents any further changes to the assembly that can trigger regeneration of the assembly.

Arguments
None.

Return value
`None.`

Exceptions
None.

`unlock()`

This method unlocks the assembly. Unlocking the assembly allows it to be regenerated after any modifications to the assembly.

Arguments
None.

Return value
`None.`

Exceptions
None.

setMeshNumberingControl(...)

This method changes the start node and/or element labels on the specified independent part instances before or after Abaqus/CAE generates the meshes. For the meshed instances, Abaqus/CAE changes the node and/or element labels while preserving the original order and incrementation.

Required arguments

instances A sequence of *PartInstance* objects to change the start node and/or element labels.

Optional arguments

startNodeLabel A positive Integer specifying the new start node label.

startElemLabel A positive Integer specifying the new start element label.

Return value

`None.`

Exceptions

None.

copyMeshPattern(...)

This method copies a mesh pattern from a source region consisting of a set of shell elements or element faces onto a target face, mapping nodes and elements in a one-one correspondence between source and target.

Required arguments

None.

Optional arguments

elements A sequence of *MeshElement* objects or a Set object containing elements and specifying the source region.

faces A sequence of *Face* objects that have associated with shell elements or element faces and specifying the source region.

elemFaces A sequence of *MeshFace* objects specifying the source region.

targetFace A *MeshFace* object specifying the target region. The target face can be of a different part instance.

nodes A sequence of MeshNode objects or a Set object containing nodes on the boundary of source region that are to be positioned to the boundary of target face.

coordinates A sequence of three-dimensional coordinate tuples specifying the coordinates for each of the given nodes. When specified, the number of coordinate tuples must match the number of given nodes, and be ordered to correspond to the given nodes in *ascending order* according to index. These coordinates are positions of the nodes of a mesh that will be the target face corresponding to nodes provided.

Return value

`None.`

Exceptions

None.

`smoothNodes(...)`

This method smooths the given nodes of a native mesh, moving them locally to a more optimal location that improves the quality of the mesh

Required arguments

nodes A sequence of MeshNode objects or a Set object containing nodes.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

Members

The Assembly object can have the following members:

isOutOfDate An Int specifying that feature parameters have been modified but that the assembly has not been regenerated. Possible values are 0 and 1.

timeStamp A Float specifying which gives an indication when the assembly was last modified.

isLocked An Int specifying whether the assembly is locked or not. Possible values are 0 and 1.

regenerateConstraintsTogether A Boolean specifying whether the positioning constraints in the assembly should be regenerated together before regenerating other assembly features. The default value is ON.

If the assembly has position constraint features and you modify the value of *regenerateConstraintsTogether*, Abaqus/CAE will regenerate the assembly features.

vertices
A *VertexArray* object specifying all the vertices existing at the assembly level. This member does not provide access to the vertices at the instance level.

edges
An *EdgeArray* object specifying all the edges existing at the assembly level. This member does not provide access to the edges at the instance level.

elements
A *MeshElementArray* object specifying all the elements existing at the assembly level. This member does not provide access to the elements at the instance level.

nodes
A *MeshNodeArray* object specifying all the nodes existing at the assembly level. This member does not provide access to the nodes at the instance level.

instances
A repository of *PartInstance* objects.

datums
A repository of *Datum* objects specifying all *Datum* objects in the assembly.

features
A repository of *Feature* objects specifying all *Feature* objects in the assembly.

featuresById
A repository of *Feature* objects specifying all *Feature* objects in the assembly.

The *Feature* objects in the featuresById repository are the same as the *Feature* objects in the features repository. However, the key to the objects in the featuresById repository is an integer specifying the *ID*, whereas the key to the objects in the features repository is a string specifying the *name*.

surfaces
A repository of *Surface* objects specifying for more information, see *Region commands*.

allSurfaces
A repository of *Surface* objects specifying for more information, see *Region commands*.

allInternalSurfaces
A repository of *Surface* objects specifying picked regions.

sets
A repository of *Set* objects.

allSets
A repository of *Set* objects specifying for more information, see *Region commands*.

allInternalSets
A repository of *Set* objects specifying picked regions.

skins
A repository of *Skin* objects specifying the skins created on the assembly.

stringers
A repository of *Stringer* objects specifying the stringers created on the assembly.

referencePoints
A repository of *ReferencePoint* objects.

modelInstances
A repository of *ModelInstance* objects.

allinstances

A *PartInstance* object specifying the PartInstances and A *ModelInstance* object specifying the ModelInstances.

engineeringFeatures

An *EngineeringFeature* object.

modelName

A String specifying the name of the model to which the assembly belongs.

connectorOrientations

A *ConnectorOrientationArray* object.

sectionAssignments

A *SectionAssignmentArray* object.

ConnectorOrientation object

The ConnectorOrientation object is used to assign a connector orientation to a connector.

Access

```
import assembly
mdb.models[name].rootAssembly.connectorOrientations[i]
import odbAccess
session.odbs[name].rootAssembly.connectorOrientations[i]
```

ConnectorOrientation(...)

This method creates a ConnectorOrientation object.

Path

```
mdb.models[name].rootAssembly.ConnectorOrientation
session.odbs[name].rootAssembly.ConnectorOrientation
```

Required arguments

region A *Set* object specifying the region to which the orientation is assigned.

Optional arguments

localCsys1 A *DatumCsys* object specifying the local coordinate system of the first connector point. This value may be None, indicating the global coordinate system.

axis1 A SymbolicConstant specifying the axis of a datum coordinate system about which an additional rotation is applied. Possible values are AXIS_1, AXIS_2, and AXIS_3. The default value is AXIS_1.

angle1 A Float specifying the angle of the additional rotation. The default value is 0.0.

orient2sameAs1 A Boolean specifying whether or not the second connector point is to use the same local coordinate system, axis, and angle as the first point. The default value is ON.

localCsys2 A *DatumCsys* object specifying the local coordinate system of the second connector point. This value may be None, indicating the global coordinate system.

axis2 A SymbolicConstant specifying the axis of a datum coordinate system about which an additional rotation is applied. Possible values are AXIS_1, AXIS_2, and AXIS_3. The default value is AXIS_1.

angle2 A Float specifying the angle of the additional rotation. The default value is 0.0.

Return value

A ConnectorOrientation object.

Exceptions

None.

setValues(...)

This method modifies the ConnectorOrientation object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConnectorOrientation* method.

Return value

`None.`

Exceptions

None.

Members

The ConnectorOrientation object has members with the same names and descriptions as the arguments to the *ConnectorOrientation* method.

Feature object

The following commands operate on Feature objects. For more information about the Feature object, see *Feature object*.

Access

```
import assembly
```

AttachmentLines(...)

This method creates a Feature object by creating attachment lines between the given set of source and target faces. The given points are first projected onto the source faces using the specified projection method. The points are then projected normal to the source faces onto the target faces. The user can specify the number of projections or the length of projection vector for projection onto the target faces. The lines are then created between the source face and the closest target face. Subsequent lines are created between the target faces.

Path

mdb.models[*name*].rootAssembly.AttachmentLines

Required arguments

name
A String specifying a unique Feature name.

points
A tuple of points. Each point can be a Vertex, Datum point, Reference point, an Attachment point, orphan mesh Node, or an Interesting point object.

sourceFaces
A sequence of *Face* objects specifying the geometry faces onto which the points are to be projected.

sourceElementFaces
A sequence of *MeshFace* objects specifying the orphan mesh element faces onto which the points are to be projected.

targetFaces
A sequence of *Face* objects specifying the geometry faces on which the attachment lines will terminate.

targetElementFaces
A sequence of *MeshFace* objects specifying the orphan mesh element faces on which the attachment lines will terminate.

Optional arguments

projectionMethod
A SymbolicConstant specifying the method to be used to project onto source faces. Possible values are PROJECT_BY_PROXIMITY and PROJECT_BY_DIRECTION. The default value is PROJECT_BY_PROXIMITY.

projectionDirStartPt
A point specifying the start point of the projection direction to project onto source faces. The point can be a Vertex, Datum point, Reference point, Attachment point, orphan mesh Node, Interesting Point object, or a tuple of Floats representing the coordinates of a point.

projectionDirEndPt A point specifying the end point of the projection direction to project onto source faces. The point can be a Vertex, Datum point, Reference point, Attachment point, orphan mesh Node, Interesting point object, or a tuple of Floats representing the coordinates of a point.

sourceToTargetProjMethod A SymbolicConstant specifying the method to be used to project onto target faces. Possible values are PROJECT_BY_NUMBER and PROJECT_BY_DISTANCE. The default value is PROJECT_BY_NUMBER.

numProjections An integer specifying the maximum number of layers each point should be projected onto when the source to target projection method is PROJECT_BY_NUMBER.

projectionDistance A float specifying the maximum distance of the projection vector when the source to target projection method is PROJECT_BY_DISTANCE.

flipSourceToTargetDirection A Boolean specifying whether the computed projection direction from the source to the target faces should be flipped.

setName A String specifying a unique set name.

Return value

A Feature object.

Exceptions

None.

Coaxial(...)

This method moves an instance so that its selected face is coaxial with the selected face of a fixed instance.

Path

mdb.models[*name*].rootAssembly.Coaxial

Required arguments

movableAxis A cylindrical or conical Face on the part instance to be moved.

fixedAxis A cylindrical or conical Face on the part instance that remains fixed.

flip A Boolean specifying whether the axes are forward aligned (OFF) or reverse aligned (ON).

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

CoincidentPoint(...)

This method moves an instance so that a specified point is coincident with a specified point of a fixed instance.

Path

mdb.models[*name*].rootAssembly.CoincidentPoint

Required arguments

movablePoint A Vertex, a Datum point, or a ReferencePoint or a mesh node from an orphan mesh on the part instance to be moved.

fixedPoint A Vertex, a Datum point, or a ReferencePoint or a mesh node from an orphan mesh on the part instance to remain fixed.

Optional arguments

None.

Return value

A Feature object.

Exceptions

None.

EdgeToEdge(...)

This method moves an instance so that its edge is parallel to an edge of a fixed instance.

Path

mdb.models[*name*].rootAssembly.EdgeToEdge

Required arguments

movableAxis A straight Edge, a Datum axis, or an element edge from an orphan mesh on the part instance to be moved.

fixedAxis A straight Edge, a Datum axis, or an element edge from an orphan mesh on the part instance to remain fixed.

flip A Boolean specifying whether the edges are forward aligned (OFF) or reverse aligned (ON).

clearance A Float specifying the distance between the two edges (for two-dimensional and axisymmetric instances only).

Optional arguments

None.

Return value

A Feature Object.

Exceptions

AbaqusException.

FaceToFace(...)

This method moves an instance so that its face is coincident with a face of a fixed instance.

Path

mdb.models[*name*].rootAssembly.FaceToFace

Required arguments

movablePlane A planar face, a Datum plane, or a face from an orphan mesh on the part instance to be moved.

fixedPlane A planar face, a Datum plane, or a face from an orphan mesh on the part instance to remain fixed.

flip A Boolean specifying whether the normals to the faces are forward aligned (OFF) or reverse aligned (ON).

clearance A Float specifying the distance between the two faces.

Optional arguments

None.

Return value

A Feature Object.

Exceptions

AbaqusException.

ParallelCsys(...)

This method moves an instance so that its Datum coordinate system is parallel to a Datum coordinate system of a fixed instance.

Path

mdb.models[*name*].rootAssembly.ParallelCsys

Required arguments

movableCsys	A Datum coordinate system on the part instance to be moved.
fixedCsys	A Datum coordinate system on the part instance to remain fixed.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

ParallelEdge(...)

This method moves an instance so that its edge is parallel to an edge of a fixed instance.

Path

mdb.models[*name*].rootAssembly.ParallelEdge

Required arguments

movableAxis	A straight Edge, a Datum axis, or an element edge from an orphan mesh on the part instance to be moved.
fixedAxis	A straight Edge, a Datum axis, or an element edge from an orphan mesh on the part instance to remain fixed.
flip	A Boolean specifying whether the edges are forward aligned (OFF) or reverse aligned (ON).

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

ParallelFace(...)

This method moves an instance so that its face is parallel to a face of a fixed instance.

Path

mdb.models[*name*].rootAssembly.ParallelFace

Required arguments

movablePlane	A planar face, a Datum plane, or a face from an orphan mesh on the part instance to be moved.
fixedPlane	A planar face, a Datum plane, or a face from an orphan mesh on the part instance to remain fixed.
flip	A Boolean specifying whether the normals to the faces are forward aligned (OFF) or reverse aligned (ON).

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

PartInstance object

A PartInstance object is an instance of a Part object.

Access

```
import assembly
mdb.models[name].rootAssembly.allInstances[name]
mdb.models[name].rootAssembly.instances[name]
```

Instance(...)

This method creates a PartInstance object and puts it into the instances repository.

Path

```
mdb.models[name].rootAssembly.Instance
```

Required arguments

name A String specifying the repository key. The name must be a valid Abaqus object name.

part A *Part* object to be instanced. If the part does not exist, no PartInstance object is created.

Optional arguments

autoOffset A Boolean specifying whether to apply an auto offset to the new part instance that will offset it from existing part instances. The default value is OFF.

dependent A Boolean specifying whether the part instance is dependent or independent. If *dependent*=OFF, the part instance is independent. The default value is OFF.

Return value

A PartInstance object.

Exceptions

None.

InstanceFromBooleanCut(...)

This method creates a PartInstance in the instances repository after subtracting or cutting the geometries of a group of part instances from that of a base part instance.

Path

```
mdb.models[name].rootAssembly.InstanceFromBooleanCut
```

Required arguments

name
A String specifying the repository key. The name must be a valid Abaqus object name.

instanceToBeCut
A PartInstance specifying the base instance from which to cut other instances.

cuttingInstances
A sequence of PartInstance objects specifying the instances with which to cut the base instance.

Optional arguments

originalInstances
A SymbolicConstant specifying whether the original instances should be suppressed or deleted after the merge operation. Possible values are SUPPRESS or DELETE. The default value is SUPPRESS.

Return value

A PartInstance object.

Exceptions

None.

InstanceFromBooleanMerge(...)

This method creates a PartInstance in the instances repository after merging two or more part instances.

Path

```
mdb.models[name].rootAssembly.InstanceFromBooleanMerge
```

Required arguments

name
A String specifying the repository key. The name must be a valid Abaqus object name.

instances
A sequence of PartInstance objects specifying the part instances to merge.

Optional arguments

keepIntersections
A Boolean specifying whether the boundary intersections of Abaqus native part instances should be retained after the merge operation. The default value is False.

originalInstances
A SymbolicConstant specifying whether the original instances should be suppressed or deleted after the merge operation. Possible values are SUPPRESS or DELETE. The default value is SUPPRESS.

domain
A SymbolicConstant specifying whether geometry or mesh of the specified part instances is to be merged. Possible values are GEOMETRY, MESH or BOTH. The default value is GEOMETRY.

mergeNodes
A SymbolicConstant specifying which nodes of the specified part instances should be considered for merging. This argument is only applicable if *domain* is MESH. Possible values are BOUNDARY_ONLY, ALL, or NONE. The default value is BOUNDARY_ONLY.

nodeMergingTolerance
A Float specifying the maximum distance between nodes of the specified part instances that will be merged and replaced with a single node in the new part. The location of the new node is the average position of the deleted nodes. This argument is only applicable if *domain* is MESH. The default value is 10^{-6}.

removeDuplicateElements
A Boolean specifying whether elements with the same connectivity in the new part will be merged into a single element. This argument is only applicable if *domain* is MESH. The default value is True.

Return value

A PartInstance object.

Exceptions

None.

LinearInstancePattern(...)

This method creates multiple PartInstance objects in a linear pattern and puts them into the instances repository.

Path

```
mdb.models[name].rootAssembly.LinearInstancePattern
```

Required arguments

instanceList
A sequence of Strings specifying the names of instances to pattern.

number1
An Int specifying the total number of instances, including the original instances, that appear along the first direction in the pattern.

spacing1
A Float specifying the spacing between instances along the first direction in the pattern.

number2
An Int specifying the total number of instances, including the original instances, that appear along the second direction in the pattern.

spacing2
A Float specifying the spacing between instances along the second direction in the pattern.

Optional arguments

direction1
A sequence of three Floats specifying a vector along the first direction. The default value is (1.0, 0.0, 0.0).

direction2
A sequence of three Floats specifying a vector along the second direction. The default value is (0.0, 1.0, 0.0).

Return value

A sequence of PartInstance objects.

Exceptions

None.

RadialInstancePattern(...)

This method creates multiple PartInstance objects in a radial pattern and puts them into the instances repository.

Path

```
mdb.models[name].rootAssembly.RadialInstancePattern
```

Required arguments

instanceList
A sequence of Strings specifying the names of instances to pattern.

number
An Int specifying the total number of instances, including the original instances, that appear in the radial pattern.

totalAngle
A Float specifying the total angle in degrees between the first and last instance in the pattern. A positive angle corresponds to a counter-clockwise direction. The values 360° and −360° represent a special case where the pattern makes a full circle. In this case, because the copy would overlay the original, the copy is not placed at the last position. Possible values are $-360.0 \leq totalAngle \leq 360.0$.

Optional arguments

point
A sequence of three Floats specifying the center of the radial pattern. The default value is (0.0, 0.0, 0.0).

axis
A sequence of three Floats specifying the central axis of the radial pattern. The default value is (0.0, 0.0, 1.0).

Return value

A sequence of PartInstance objects.

Exceptions

None.

checkGeometry(...)

This method checks the validity of the geometry of the part instance and prints a count of all topological entities on the part instance (faces, edges, vertices, etc.).

Required arguments

None.

Optional arguments

detailed A Boolean specifying whether detailed output will be printed to the replay file. The default value is OFF.

level An Int specifying which level of checking is performed. Values can range from 20 to 70, with higher values reporting less and less important errors. The default value is 20, which reports all critical errors. When the default value is used, the stored validity status is updated to agree with the result of this check.

Return value

`None.`

Exceptions

An exception is thrown if this is a dependent part instance and *level* was either not specified or was set to 20, because the validity status cannot be updated for a dependent part instance. In this case, this command should be called on the *Part* instead.	The geometry of dependent part instances cannot be changed.

Contact(...)

This method translates an instance along the specified direction until it is in contact with a fixed instance.

Required arguments

movableList A sequence of *Face* or *Edge* objects on the part instance to be moved.

fixedList A sequence of *Face* or *Edge* objects on the part instance to remain fixed.

direction A sequence of three Floats specifying the direction of contact.

clearance A Float specifying the distance between the two faces along the direction of contact.

Optional arguments

isFaceEdges A Boolean specifying how Abaqus calculates the contact. If *isFaceEdges* is OFF, contact is computed from the movable face to the fixed face. If *isFaceEdges* is ON, contact is computed using only the edges of the movable face and not its interior. The default value is OFF.

Return value

A *Feature* object.

Exceptions

None.

ConvertConstraints()

This method converts the position constraints of an instance to absolute positions. The method deletes the constraint features on the instance but preserves the position in space.

Arguments

None.

Return value

`None.`

Exceptions

None.

getPosition()

This method prints the sum of the translations and rotations applied to the PartInstance object.

Arguments

None.

Return value

`None.`

Exceptions

None.

getRotation()

This method returns a tuple including the point of rotation, axis of rotation, and rotation angle (in degrees).

Arguments

None.

Return value

A tuple including the point of rotation, axis of rotation, and rotation angle (in degrees).

Exceptions

None.

getTranslation()

This method returns a tuple of three Floats representing translation in the *X*-, *Y*-, and *Z*-directions.

Arguments

None.

Return value

A tuple of three Floats representing the translation.

Exceptions

None.

replace(...)

This method replaces one instance with an instance of another part.

Required arguments

instanceOf
A *Part* object specifying which Part will be instanced in place of the original *Part*.

Optional arguments

applyConstraints
A Boolean specifying whether to apply existing constraints on the new instance or to position the new instance in the same place as the original instance. The default value is True. A value of False indicates that constraints applies to the instance are deleted will be deleted from the feature list.

Return value

`None.`

Exceptions

None.

rotateAboutAxis(...)

This method translates an instance by the specified amount.

Required arguments

axisPoint
A sequence of three Floats specifying the *X*-, *Y*-, and *Z*-coordinates of a point on the axis.

axisDirection
A sequence of three Floats specifying the direction vector of the axis.

angle A Float specifying the rotation angle in degrees. Use the right-hand rule to determine the direction.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`translate(...)`

This method translates an instance by the specified amount.

Required arguments

vector A sequence of three Floats specifying a translation vector.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`translateTo(...)`

This method translates an instance along the specified direction until it is in contact with a fixed instance.

Required arguments

movableList A sequence of *Face* or *Edge* objects on the part instance to be moved.

fixedList A sequence of *Face* or *Edge* objects on the part instances to remain fixed.

direction A sequence of three Floats specifying the direction of contact.

clearance A Float specifying the distance between the two faces along the direction of contact.

Optional arguments

vector A sequence of three Floats specifying a translation vector. If this argument is specified, the movable instance will be translated by the specified amount without solving for the actual contact.

Return value

A *Feature* object.

Exceptions

None.

Members

The PartInstance object can have the following members:

analysisType A SymbolicConstant specifying the part type. Possible values are DEFORMABLE_BODY, EULERIAN, DISCRETE_RIGID_SURFACE, and ANALYTIC_RIGID_SURFACE.

cells A *CellArray* object.

datums A repository of *Datum* objects.

dependent A Boolean specifying whether the part instance is dependent or independent. If *dependent*=OFF, the part instance is independent. The default value is OFF.

edges An *EdgeArray* object.

elemEdges A repository of *MeshEdge* objects specifying all the element edges in the part instance. For a given element and a given edge index on a given face within that element, the corresponding *MeshEdge* object can be retrieved from the repository by using the key calculated as (i*32 + j*4 + k), where i, j, and k are zero-based element, face, and edge indices, respectively.

elementEdges A *MeshEdgeArray* object.

elementFaces A *MeshFaceArray* object.

elements A *MeshElementArray* object.

elemFaces A repository of *MeshFace* objects specifying all the element faces in the part instance. For a given element and a given face index within that element, the corresponding *MeshFace* object can be retrieved from the repository by using the key calculated as (i*8 + j), where i and j are zero-based element and face indices, respectively.

excludedFromSimulation A Boolean specifying whether the part instance is excluded from the simulation. If *excludedFromSimulation*=ON, the part instance is excluded from the simulation. The default value is OFF.

faces

A *FaceArray* object.

geometryValidity

A Boolean specifying the validity of the geometry of the instance. The value is computed, but it can be set to ON to perform feature and mesh operations on an invalid instance. There is no guarantee that such operations will work if the instance was originally invalid.

ignoredEdges

An *IgnoredEdgeArray* object.

ignoredVertices

An *IgnoredVertexArray* object.

name

A String specifying the repository key. The name must be a valid Abaqus object name.

nodes

A *MeshNodeArray* object.

part

A *Part* object specifying the instanced part.

partName

A String specifying the name of the part from which the instance was created.

referenceNode

An Int specifying the reference node number. This member is valid only if *analysisType*=DISCRETE_RIGID_SURFACE or ANALYTIC_RIGID_SURFACE.

referencePoints

A repository of *ReferencePoint* objects.

sets

A repository of *Set* objects specifying the sets created on the part. For more information, see *Region commands*.

skins

A repository of *Skin* objects specifying the skins created on the part. For more information, see *Region commands*.

stringers

A repository of *Stringer* objects specifying the stringers created on the part. For more information, see *Region commands*.

surfaces

A repository of *Surface* objects specifying the surfaces created on the part. For more information, see *Region commands*.

vertices

A *VertexArray* object.

ModelInstance object

A ModelInstance object is an instance of a Model.

Access

```
import assembly
mdb.models[name].rootAssembly.modelInstances[i]
```

Instance(...)

This method creates a ModelInstance object and puts it into the instances repository.

Path

```
mdb.models[name].rootAssembly.Instance
```

Required arguments

name The repository key. The name must be a valid Abaqus object name.

model A *Model* object to be instanced. If the model does not exist, no ModelInstance object is created.

Optional arguments

autoOffset A Boolean specifying whether to apply an auto offset to the new instance that will offset it from existing instances. The default value is OFF.

Return value

A ModelInstance object.

Exceptions

None.

ConvertConstraints()

This method converts the position constraints of an instance to absolute positions. The method deletes the constraint features on the instance but preserves the position in space.

Arguments

None.

Return value

```
None.
```

Exceptions

None.

getPosition()

This method prints the sum of the translations and rotations applied to the ModelInstance object.

Arguments

None.

Return value

`None.`

Exceptions

None.

replace(...)

This method replaces one instance with an instance of another model.

Required arguments

instanceOf

A *Model* object to be instanced. If the model does not exist, no ModelInstance object is created.

Optional arguments

applyConstraints

A Boolean specifying whether to apply existing constraints on the new instance or to position the new instance in the same place as the original instance. The default value is True. A value of False indicates that constraints applies to the instance are deleted will be deleted from the feature list.

Return value

`None.`

Exceptions

None.

translate(...)

This method translates an instance by the specified amount.

Required arguments

vector

A sequence of three Floats specifying a translation vector.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

Members

The ModelInstance object can have the following members:

sets
A repository of *Set* objects specifying the sets created on the assembly. For more information, see *Region commands*.

surfaces
A repository of *Surface* objects specifying the surfaces created on the assembly. For more information, see *Region commands*.

vertices
A *VertexArray* object.

edges
An *EdgeArray* object.

elements
A *MeshElementArray* object.

nodes
A *MeshNodeArray* object.

datums
A repository of *Datum* objects.

referencePoints
A repository of *ReferencePoint* objects.

Model object

The following commands operate on Model objects. For more information about the Model object, see *Model object*.

Access

```
import assembly
```

Instance(...)

This method copies a *PartInstance* object from the specified model and creates a new *PartInstance* object.

Path

mdb.models[*name*].Instance

Required arguments

name	A String specifying the repository key.
objectToCopy	A *PartInstance* object to be copied.

Optional arguments

None.

Return value

A Model object.

Exceptions

None.

convertAllSketches(...)

This method converts all sketches from Abaqus 6.5 or earlier to the equivalent *ConstrainedSketch* objects.

Required arguments

None.

Optional arguments

regenerate	A Boolean specifying if all the features in assembly as well as in all the parts in the model should be regenerated after the conversion. The default value is True.
convertReversedSketches	A Boolean specifying whether sketches in analytic rigid parts should be converted even if they cause the orientation of surfaces defined on them to be flipped. The default value is True.

Return value

A list of strings describing any warnings or errors encountered during the conversion process.

Exceptions

None.

`linkInstances(...)`

This method links the selected *PartInstance* objects to the corresponding *PartInstance* objects from the specified models. If all instances of a Part are selected for linking, the Part will be linked as well. If not, a new linked child Part object will be created and added to the repository.

Required arguments

instancesMap
A tuple of tuples containing the instance name to be linked and the corresponding *PartInstance* object to which it will be linked.

Optional arguments

None.

Return value

A list of strings describing any warnings or errors encountered during the conversion process.

Exceptions

None.

Basic geometry commands

The basic geometry commands create geometric entities that are referenced by Part objects, Instance objects, and GeometrySet objects.

In this section:

- *Cell object*
- *CellArray object*
- *Edge object*
- *EdgeArray object*
- *Face object*
- *FaceArray object*
- *IgnoredEdge object*
- *IgnoredEdgeArray object*
- *IgnoredVertex object*
- *IgnoredVertexArray object*
- *InterestingPoint object*
- *ModelDot object*
- *ReferencePoint object*
- *Transform object*
- *Vertex object*
- *VertexArray object*

Cell object

Cells are volumetric regions of geometry.

Access

```
import part
mdb.models[name].parts[name].allInternalSets[name].cells[i]
mdb.models[name].parts[name].allSets[name].cells[i]
mdb.models[name].parts[name].cells[i]
mdb.models[name].parts[name].sets[name].cells[i]
import assembly
mdb.models[name].rootAssembly.allInstances[name].cells[i]
mdb.models[name].rootAssembly.allInstances[name].sets[name].cells[i]
mdb.models[name].rootAssembly.allInternalSets[name].cells[i]
mdb.models[name].rootAssembly.allSets[name].cells[i]
mdb.models[name].rootAssembly.instances[name].cells[i]
mdb.models[name].rootAssembly.instances[name].sets[name].cells[i]
mdb.models[name].rootAssembly.modelInstances[i].sets[name].cells[i]
mdb.models[name].rootAssembly.sets[name].cells[i]
```

`getSize(...)`

This method returns a Float indicating the volume of the cell.

Required arguments

None.

Optional arguments

printResults A Boolean that determines whether a verbose output is to be printed. The default is True.

Return value

A Float.

Exceptions

None.

`getFaces()`

This method returns a sequence consisting of the face IDs of the faces which bound the cell.

Arguments

None.

Return value

A tuple of integers.

Exceptions

None.

getEdges()

This method returns a sequence consisting of the edge IDs of the edges on the cell.

Arguments

None.

Return value

A tuple of integers.

Exceptions

None.

getVertices()

This method returns a sequence consisting of the vertex IDs of the vertices on the cell.

Arguments

None.

Return value

A tuple of integers.

Exceptions

None.

getAdjacentCells()

This method returns an array of cell objects that share at least one face of the cell.

Arguments

None.

Return value

A *CellArray* object which is a sequence of Cell objects.

Exceptions

None.

getNodes()

This method returns an array of node objects that are associated with the cell.

Arguments

None.

Return value

A *MeshNodeArray* object which is a sequence of *MeshNode* objects.

Exceptions

None.

`getElements()`

This method returns an array of element objects that are associated with the cell.

Arguments

None.

Return value

A *MeshElementArray* object which is a sequence of *MeshElement* objects.

Exceptions

None.

`getCADAttributes(...)`

This method returns an array of CAD attribute strings associated with the cell when the part was created from CAD data.

Arguments

None.

Return value

An array of String.

Exceptions

None.

Members

The Cell object has the following members:

index

An Int specifying the index of the cell in the CellArray.

isReferenceRep

A Boolean specifying whether the cell belongs to the reference representation of the Part or Instance.

pointOn

A tuple of Floats specifying the *X*-, *Y*-, and *Z*-coordinates of a point located on the cell.

featureName

A tuple of Floats specifying the name of the feature that created this cell.

instanceName

A tuple of Floats specifying the name of the part instance for this cell (if applicable).

CellArray object

The CellArray is a sequence of *Cell* objects.

Access

```
import part
mdb.models[name].parts[name].allInternalSets[name].cells
mdb.models[name].parts[name].allSets[name].cells
mdb.models[name].parts[name].cells
mdb.models[name].parts[name].sets[name].cells
import assembly
mdb.models[name].rootAssembly.allInstances[name].cells
mdb.models[name].rootAssembly.allInstances[name].sets[name].cells
mdb.models[name].rootAssembly.allInternalSets[name].cells
mdb.models[name].rootAssembly.allSets[name].cells
mdb.models[name].rootAssembly.instances[name].cells
mdb.models[name].rootAssembly.instances[name].sets[name].cells
mdb.models[name].rootAssembly.modelInstances[i].sets[name].cells
mdb.models[name].rootAssembly.sets[name].cells
```

CellArray(...)

This method creates a CellArray object.

Path

part.CellArray

Required arguments

cells A list of *Cell* objects.

Optional arguments

None.

Return value

A CellArray object.

Exceptions

None.

findAt(...)

This method returns the object or objects in the CellArray located at the given coordinates. `findAt` initially uses the ACIS tolerance of 1E-6. As a result, `findAt` returns any entity that is at the arbitrary point specified or at a distance of less than 1E-6 from the arbitrary point. If nothing is found, `findAt` uses the tolerance for imprecise geometry (applicable only for imprecise geometric entities). The arbitrary point must not be shared by a second cell. If two cells intersect or coincide at the arbitrary point, `findAt` chooses the first cell that it encounters, and you should not rely on the return value being consistent.

`findAt` will always try to find objects among all the cells in the part or assembly instance and will not restrict itself to a subset even if the CellArray represents such subset.

Required arguments

coordinates A sequence of Floats specifying the *X*-, *Y*-, and *Z*-coordinates of the object to find.

`findAt` returns either a Cell object or a sequence of Cell objects based on the type of input. If *coordinates* is a sequence of Floats, `findAt` returns the Cell object at that point. If *coordinates* is a sequence of sequence of Floats, `findAt` returns a sequence of Cell objects at the given locations. The sequence of sequence of Floats must be a sequence of sequence of point and normal data, not a sequence of point data. For example,

```
cells1 = myCrackedBlockInstance.cells.findAt(
                                ((5.5, -8.3, 294.2),),
                                ((12.1, -8.3, 287.8),),
                                ((14.4, -10.4, 285.5),),)
```

Optional arguments

printWarning A Boolean specifying whether a message is to be printed to the CLI if no entity is found at the specified location. The default value is True.

Return value

A Cell object.

Exceptions

None.

`getExteriorFaces()`

This method returns the cell faces on the exterior of the CellArray. That is, it returns the faces that are referenced by exactly one of the cells in the sequence.

Arguments

None.

Return value

A FaceArray object representing the faces on the exterior of the cells.

Exceptions

None.

`getSequenceFromMask(...)`

This method returns the object or objects in the CellArray identified using the specified *mask*. This command is generated when the *JournalOptions* are set to COMPRESSEDINDEX. When large number of objects are involved, this method is highly efficient.

Required arguments

mask A String specifying the object or objects.

Optional arguments

None.

Return value

A Cell object or a sequence of Cell objects.

Exceptions

An exception occurs if the resulting sequence is empty. Error: The mask results in an empty sequence

`getMask()`

This method returns a string specifying the object or objects.

Arguments

None.

Return value

A String specifying the object or objects.

Exceptions

None.

`getByBoundingBox(...)`

This method returns an array of cell objects that lie within the specified bounding box.

Required arguments

None.

Optional arguments

xMin A float specifying the minimum *X*-boundary of the bounding box.

yMin A float specifying the minimum *Y*-boundary of the bounding box.

zMin A float specifying the minimum *Z*-boundary of the bounding box.

xMax A float specifying the maximum *X*-boundary of the bounding box.

yMax A float specifying the maximum *Y*-boundary of the bounding box.

zMax A float specifying the maximum *Z*-boundary of the bounding box.

Return value

A CellArray object, which is a sequence of *Cell* objects.

Exceptions

None.

`getByBoundingCylinder(...)`

This method returns an array of cell objects that lie within the specified bounding cylinder.

Required arguments

center1 A tuple of the *X*-, *Y*-, and *Z*-coordinates of the center of the first end of the cylinder.

center2 A tuple of the *X*-, *Y*-, and *Z*-coordinates of the center of the second end of the cylinder.

radius A float specifying the radius of the cylinder.

Optional arguments

None.

Return value

A CellArray object, which is a sequence of *Cell* objects.

Exceptions

None.

`getByBoundingSphere(...)`

This method returns an array of cell objects that lie within the specified bounding sphere.

Required arguments

center A tuple of the *X*-, *Y*-, and *Z*-coordinates of the center of the sphere.

radius A float specifying the radius of the sphere.

Optional arguments

None.

Return value

A CellArray object, which is a sequence of *Cell* objects.

Exceptions

None.

`getBoundingBox()`

This method returns a dictionary of two tuples representing minimum and maximum boundary values of the bounding box of the minimum size containing the cell sequence.

Arguments

None.

Return value

A Dictionary object with the following items:

low: a tuple of three floats representing the minimum *X*-, *Y*-, and *Z*-boundary values of the bounding box.

high: a tuple of three floats representing the maximum *X*-, *Y*-, and *Z*-boundary values of the bounding box.

Exceptions

None.

Members

The CellArray object has no members.

Edge object

Edges are one-dimensional regions of geometry.

Access

```
import part
mdb.models[name].parts[name].allInternalSets[name].edges[i]
mdb.models[name].parts[name].allInternalSurfaces[name].edges[i]
mdb.models[name].parts[name].allSets[name].edges[i]
mdb.models[name].parts[name].allSurfaces[name].edges[i]
mdb.models[name].parts[name].edges[i]
mdb.models[name].parts[name].sets[name].edges[i]
mdb.models[name].parts[name].surfaces[name].edges[i]
import assembly
mdb.models[name].rootAssembly.allInstances[name].edges[i]
mdb.models[name].rootAssembly.allInstances[name].sets[name].edges[i]
mdb.models[name].rootAssembly.allInstances[name].surfaces[name].edges[i]
mdb.models[name].rootAssembly.allInternalSets[name].edges[i]
mdb.models[name].rootAssembly.allInternalSurfaces[name].edges[i]
mdb.models[name].rootAssembly.allSets[name].edges[i]
mdb.models[name].rootAssembly.allSurfaces[name].edges[i]
mdb.models[name].rootAssembly.edges[i]
mdb.models[name].rootAssembly.instances[name].edges[i]
mdb.models[name].rootAssembly.instances[name].sets[name].edges[i]
mdb.models[name].rootAssembly.instances[name].surfaces[name].edges[i]
mdb.models[name].rootAssembly.modelInstances[i].edges[i]
mdb.models[name].rootAssembly.modelInstances[i].sets[name].edges[i]
mdb.models[name].rootAssembly.modelInstances[i].surfaces[name]\
.edges[i]
mdb.models[name].rootAssembly.sets[name].edges[i]
mdb.models[name].rootAssembly.surfaces[name].edges[i]
```

isTangentFlipped()

This method determines whether the tangent to the edge is flipped from its default direction by the use of the `flipTangent` method on a Part object.

Arguments

None.

Return value

A Boolean value of True if the tangent is flipped and False if not.

Exceptions

None.

getCurvature(...)

This method returns curvature information at a location on the edge.

Required arguments

parameter A Float specifying the normalized parameter location on the edge where the curvature is to be computed. This argument is mutually exclusive with the argument *point*.

point A tuple of *X*-, *Y*-, and *Z*-coordinates of a point at which the curvature is to be computed. If *point* does not lie on the edge an attempt is made to project it onto the edge and use the projected point.

Optional arguments

None.

Return value

A dictionary with keys 'evaluationPoint', 'curvature', 'radius', and 'tangent', where 'evaluationPoint' specifies the location at which the curvature was computed; 'curvature' specifies the curvature vector at that location; 'radius' is the radius of curvature; and 'tangent' specifies the tangent to the edge at that location.

Exceptions

The given edge is straight.

`getFaces()`

This method returns a sequence consisting of the face ids of the faces which share this edge.

Arguments

None.

Return value

A tuple of integers.

Exceptions

None.

`getAdjacentEdges()`

This method returns an array of Edge objects that share at least one vertex of the edge.

Arguments

None.

Return value

An *EdgeArray* object, which is a sequence of Edge objects.

Exceptions

None.

`getEdgesByEdgeAngle(...)`

This method returns an array of Edge objects that are obtained by recursively finding adjacent edges that are at an angle of less than or equal to the specified face angle.

Required arguments

angle A float specifying the value of the face angle in degrees.

Optional arguments

None.

Return value

An *EdgeArray* object, which is a sequence of Edgeobjects.

Exceptions

None.

`getNodes()`

This method returns an array of node objects that are associated with the edge.

Arguments

None.

Return value

A *MeshNodeArray* object, which is a sequence of *MeshNode* objects.

Exceptions

None.

`getElements()`

This method returns an array of element objects that are associated with the edge.

Arguments

None.

Return value

A *MeshElementArray* object which is a sequence of *MeshElement* objects.

Exceptions

None.

getRadius()

This method returns the radius of circular edges.

Arguments

None.

Return value

A Float specifying the radius.

Exceptions

The given edges is not circular.

getSize(...)

This method returns a Float indicating the length of the edge.

Required arguments

None.

Optional arguments

printResults	A Bool specifying whether verbose output is printed. The default is True.

Return value

A Float.

Exceptions

None.

getVertices()

This method returns a sequence of indices of the vertices that bound this edge. The first index refers to the vertex where the normalized curve parameter = 0.0, and the second index refers to the vertex where the normalized curve parameter = 1.0. If the edge is a closed curve, only one vertex index is returned.

Arguments

None.

Return value

A tuple of integers.

Exceptions

None.

Members

The Edge object has the following members:

index
An Int specifying the index of the edge in the EdgeArray.

isReferenceRep
A Boolean specifying whether the edge belongs to the reference representation of the Part or Instance.

pointOn
A tuple of Floats specifying the *X*-, *Y*-, and *Z*-coordinates of a point located on the edge.

featureName
A tuple of Floats specifying the name of the feature that created this edge.

instanceName
A tuple of Floats specifying the name of the part instance for this edge (if applicable).

EdgeArray object

The EdgeArray is a sequence of *Edge* objects. If the part is modified, then EdgeArray must be updated for that part.

Access

```
import part
mdb.models[name].parts[name].allInternalSets[name].edges
mdb.models[name].parts[name].allInternalSurfaces[name].edges
mdb.models[name].parts[name].allSets[name].edges
mdb.models[name].parts[name].allSurfaces[name].edges
mdb.models[name].parts[name].edges
mdb.models[name].parts[name].sets[name].edges
mdb.models[name].parts[name].surfaces[name].edges
import assembly
mdb.models[name].rootAssembly.allInstances[name].edges
mdb.models[name].rootAssembly.allInstances[name].sets[name].edges
mdb.models[name].rootAssembly.allInstances[name].surfaces[name].edges
mdb.models[name].rootAssembly.allInternalSets[name].edges
mdb.models[name].rootAssembly.allInternalSurfaces[name].edges
mdb.models[name].rootAssembly.allSets[name].edges
mdb.models[name].rootAssembly.allSurfaces[name].edges
mdb.models[name].rootAssembly.edges
mdb.models[name].rootAssembly.instances[name].edges
mdb.models[name].rootAssembly.instances[name].sets[name].edges
mdb.models[name].rootAssembly.instances[name].surfaces[name].edges
mdb.models[name].rootAssembly.modelInstances[i].edges
mdb.models[name].rootAssembly.modelInstances[i].sets[name].edges
mdb.models[name].rootAssembly.modelInstances[i].surfaces[name].edges
mdb.models[name].rootAssembly.sets[name].edges
mdb.models[name].rootAssembly.surfaces[name].edges
```

EdgeArray(...)

This method creates an EdgeArray object.

Path

part.EdgeArray

Required arguments

edges A list of *Edge* objects.

Optional arguments

None.

Return value

A EdgeArray object.

Exceptions

None.

`findAt(...)`

This method returns the object or objects in the EdgeArray located at the given coordinates.

`findAt` initially uses the ACIS tolerance of 1E-6. As a result, `findAt` returns any edge that is at the arbitrary point specified or at a distance of less than 1E-6 from the arbitrary point. If nothing is found, `findAt` uses the tolerance for imprecise geometry (applicable only for imprecise geometric entities). The arbitrary point must not be shared by a second edge. If two edges intersect or coincide at the arbitrary point, `findAt` chooses the first edge that it encounters, and you should not rely on the return value being consistent.

`findAt` will always try to find objects among all the edges in the part or assembly instance and will not restrict itself to a subset even if the EdgeArray represents such subset.

Required arguments

coordinates A sequence of Floats specifying the *X*-, *Y*-, and *Z*-coordinates of the object to find.

`findAt` returns either an Edge object or a sequence of Edge objects based on the type of input.

- If *coordinates* is a sequence of Floats, `findAt` returns the Edge object at that point.
- If you omit the *coordinates* keyword argument, `findAt` accepts as arguments a sequence of sequence of floats in the following format:

```
edges = e.findAt(((20.19686, -169.513997, 27.798593), ),
                 ((19.657627, -167.295749, 27.056402), ),
                 ((18.274129, -157.144741, 25.15218), ))
```

Optional arguments

printWarning A Boolean specifying whether a message is to be printed to the CLI if no entity is found at the specified location. The default value is True.

Return value

An Edge object or a sequence of Edge objects.

Exceptions

None.

`getClosest(...)`

This method returns an object or objects in the EdgeArray closest to the given set of points, where the given points need not lie on the edges in the EdgeArray.

Required arguments

coordinates A sequence of a sequence of floats, where each sequence of floats describes the *X*-, *Y*-, and *Z*-coordinates of a point.

```
r=e.getClosest(coordinates=((20.0,20.0,10.0),(-1.0, -15.0, 15),))

r.keys()

[0, 1]

r[0]

(mdb.models['Model-1'].parts['Part-1'].edges[3],
                                    (15.7090625762939, 20.0, 10.0))
```

Optional arguments

searchTolerance A double specifying the distance within which the closest object must lie. The default value is half of the parent part/instance size.

Return value

This method returns a dictionary object. The key to the dictionary object is the position of the input point in the tuple specified in the *coordinates* starting at index 0. If a closest edge could be found then the value is a sequence consisting of two objects. The first object in the sequence is an *Edge* that is close to the input point referred to by the key. The second object in the sequence is a sequence of floats that specifies the *X*-, *Y*-, and *Z*-location of the closest point on the *Edge* to the given point. See program listing above.

Exceptions

None.

`getSequenceFromMask(...)`

This method returns the object or objects in the EdgeArray identified using the specified *mask*. This command is generated when the *JournalOptions* are set to COMPRESSEDINDEX. When a large number of objects are involved, this method is highly efficient.

Required arguments

mask A String specifying the object or objects.

Optional arguments

None.

Return value

An Edge object or a sequence of Edge objects.

Exceptions

An exception occurs if the resulting sequence is empty.	Error: The mask results in an empty sequence

`getMask()`

This method returns a string specifying the object or objects.

Arguments

None.

Return value

A String specifying the object or objects.

Exceptions

None.

`getByBoundingBox(...)`

This method returns an array of edge objects that lie within the specified bounding box.

Required arguments

None.

Optional arguments

xMin	A float specifying the minimum *X*-boundary of the bounding box.
yMin	A float specifying the minimum *Y*-boundary of the bounding box.
zMin	A float specifying the minimum *Z*-boundary of the bounding box.
xMax	A float specifying the maximum *X*-boundary of the bounding box.
yMax	A float specifying the maximum *Y*-boundary of the bounding box.
zMax	A float specifying the maximum *Z*-boundary of the bounding box.

Return value

An EdgeArray object, which is a sequence of *Edge* objects.

Exceptions

None.

`getByBoundingCylinder(...)`

This method returns an array of edge objects that lie within the specified bounding cylinder.

Required arguments

center1	A tuple of the *X*-, *Y*-, and *Z*-coordinates of the center of the first end of the cylinder.
center2	A tuple of the *X*-, *Y*-, and *Z*-coordinates of the center of the second end of the cylinder.
radius	A float specifying the radius of the cylinder.

Optional arguments

None.

Return value

An EdgeArray object, which is a sequence of *Edge* objects.

Exceptions

None.

`getByBoundingSphere(...)`

This method returns an array of edge objects that lie within the specified bounding sphere.

Required arguments

center	A tuple of the *X*-, *Y*-, and *Z*-coordinates of the center of the sphere.
radius	A float specifying the radius of the sphere.

Optional arguments

None.

Return value

An EdgeArray object, which is a sequence of *Edge* objects.

Exceptions

None.

`getBoundingBox()`

This method returns a dictionary of two tuples representing minimum and maximum boundary values of the bounding box of the minimum size containing the edge sequence.

Arguments

None.

Return value

A Dictionary object with the following items:

low: a tuple of three floats representing the minimum *X*-, *Y*-, and *Z*-boundary values of the bounding box.

high: a tuple of three floats representing the maximum *X*-, *Y*-, and *Z*-boundary values of the bounding box.

Exceptions

None.

Members

The EdgeArray object has no members.

Face object

Faces are two-dimensional regions of geometry.

Access

```
import part
mdb.models[name].parts[name].allInternalSets[name].faces[i]
mdb.models[name].parts[name].allInternalSurfaces[name].faces[i]
mdb.models[name].parts[name].allSets[name].faces[i]
mdb.models[name].parts[name].allSurfaces[name].faces[i]
mdb.models[name].parts[name].faces[i]
mdb.models[name].parts[name].sets[name].faces[i]
mdb.models[name].parts[name].surfaces[name].faces[i]
import assembly
mdb.models[name].rootAssembly.allInstances[name].faces[i]
mdb.models[name].rootAssembly.allInstances[name].sets[name].faces[i]
mdb.models[name].rootAssembly.allInstances[name].surfaces[name].faces[i]
mdb.models[name].rootAssembly.allInternalSets[name].faces[i]
mdb.models[name].rootAssembly.allInternalSurfaces[name].faces[i]
mdb.models[name].rootAssembly.allSets[name].faces[i]
mdb.models[name].rootAssembly.allSurfaces[name].faces[i]
mdb.models[name].rootAssembly.instances[name].faces[i]
mdb.models[name].rootAssembly.instances[name].sets[name].faces[i]
mdb.models[name].rootAssembly.instances[name].surfaces[name].faces[i]
mdb.models[name].rootAssembly.modelInstances[i].sets[name].faces[i]
mdb.models[name].rootAssembly.modelInstances[i].surfaces[name]\
.faces[i]
mdb.models[name].rootAssembly.sets[name].faces[i]
mdb.models[name].rootAssembly.surfaces[name].faces[i]
```

`getCentroid()`

This method returns the centroid of a face.

Arguments

None.

Return value

A sequence of Floats specifying the *X*-, *Y*-, and *Z*-coordinates of the centroid of the face.

Exceptions

None.

`getCurvature(...)`

This method returns information about the curvature at a location on the face.

Required arguments

point
A tuple specifying the *X*-, *Y*-, and *Z* coordinates of the point where the curvature is desired. If the *point* does not lie on the face it will be projected onto the face. This argument and *uParam* and *vParam* are mutually exclusive.

uParam
A Float specifying the normalized *U* parameter value at which the curvature is to be computed. This value must lie between (0,1). *vParam* must also be specified. This argument is mutually exclusive with *point*.

vParam
A Float specifying the normalized *V* parameter value at which the curvature is to be computed. This value must lie between (0,1).

Optional arguments

None.

Return value

A dictionary with keys 'evaluationPoint', 'principalAxis1', 'principalAxis2', 'curvature1', 'curvature2' and 'gaussianCurvature'. Where the evaluationPoint specifies the location at which the curvature was evaluated. 'principalAxis1' and 'principalAxis2' refer to the vectors specifying the two principal axes of the face. 'curvature1' and 'curvature2' specify the curvatures along the two principal axes.

Exceptions

None.

`getElements()`

This method returns an array of element objects that are associated with the face.

Arguments

None.

Return value

A *MeshElementArray* object which is a sequence of *MeshElement* objects.

Exceptions

None.

`getElementFaces(...)`

This method returns an array of mesh face objects. Each mesh face object contains the element label and the side of the element that lies on the geometric face.

Required arguments

None.

Optional arguments

faceSide

A symbolic constant specifying the side of the geometric face of a solid from which the element faces should be retrieved. Possible values are *SIDE1*, *SIDE2*, and *BOTH_SIDES*. The default value is *BOTH_SIDES*. For shell faces this option is ignored.

Return value

A *MeshFaceArray* object which is a sequence of *MeshFace* objects.

Exceptions

None.

`getNodes(...)`

This method returns an array of mesh node objects. Each mesh node object contains the label of the node that lies on the geometric face.

Required arguments

None.

Optional arguments

faceSide

A symbolic constant specifying the side of the geometric face of a solid from which the nodes should be retrieved. Possible values are xo*SIDE1*, *SIDE2*, and *BOTH_SIDES*. The default value is *BOTH_SIDES*. For shell faces and for faces with compatible meshes on either sides this option is ignored. Otherwise, the nodes on the specified side(s) of the face are output.

Return value

A *MeshNodeArray* object which is a sequence of *MeshNode* objects.

Exceptions

None.

`getNormal(...)`

This method returns the normal to a face at the location specified by the *pointOn* member. The normal at a different location on the face can be obtained by specifying the optional *point* argument.

Required arguments

None.

Optional arguments

point

A tuple specifying the *X*-, *Y*-, and *Z* coordinates of the point where the normal to the face is desired. If the *point* does not lie on the face it will be projected onto the face.

Return value

A sequence of Floats specifying the *X*-, *Y*-, and *Z*-components of the normal to the face.

Exceptions

An exception is raised if the optional argument *point* is provided but the point cannot be projected onto the face.

getSize(...)

This method returns a Float indicating the area of the face.

Required arguments

None.

Optional arguments

printResults A Bool specifying whether verbose output is printed. The default value is True.

Return value

A Float.

Exceptions

None.

getEdges()

This method returns a sequence consisting of the edge ids of the edges on the face.

Arguments

None.

Return value

A tuple of integers.

Exceptions

None.

getVertices()

This method returns a sequence consisting of the vertex ids of the vertices of the face.

Arguments

None.

Return value

A tuple of integers.

Exceptions

None.

getCells()

This method returns a sequence consisting of the cell ids of the cells to which this face belongs.

Arguments

None.

Return value

A tuple of integers.

Exceptions

None.

getAdjacentFaces()

This method returns an array of face objects that share at least one edge of the face.

Arguments

None.

Return value

A *FaceArray* object which is a sequence of Face objects.

Exceptions

None.

getFacesByFaceAngle(...)

This method returns an array of Face objects that are obtained by recursively finding adjacent faces that are at an angle of less than or equal to the specified angle.

Required arguments

angle A float specifying the value of the face angle.

Optional arguments

None.

Return value

A *FaceArray* object, which is a sequence of Face objects.

Exceptions

None.

`getFacesByCurvature()`

This method returns an array of Face objects that are obtained by recursively finding adjacent faces that share the same curvature.

Arguments

None.

Return value

A *FaceArray* object, which is a sequence of Face objects.

Exceptions

None.

`isNormalFlipped()`

This method determines whether the normal to the face is flipped from its default direction by the use of the `flipNormal` method on a Part object.

Arguments

None.

Return value

A Boolean value of True if the normal is flipped and False if not.

Exceptions

None.

`getCADAttributes(...)`

This method returns an array of CAD attribute strings associated with the Face when the part was created from CAD data.

Arguments

None.

Return value

An array of String

Exceptions

None.

Members

The Face object has the following members:

index

An Int specifying the index of the face in the FaceArray.

isReferenceRep

A Boolean specifying whether the face belongs to the reference representation of the Part or Instance.

pointOn

A tuple of tuples of Floats specifying the coordinates. For a face of a shell *pointOn* specifies the *X*-, *Y*-, and *Z*-coordinates of a point located on the face and the *X*-, *Y*-, and *Z*-components of the normal to the face.

For a face of a solid *pointOn* specifies the *X*-, *Y*-, and *Z*-coordinates of a point located on the face.

featureName

A tuple of Floats specifying the name of the feature that created this face.

instanceName

A tuple of Floats specifying the name of the part instance for this face (if applicable).

FaceArray object

The FaceArray is a sequence of *Face* objects. If the part is modified, then FaceArray must be updated for that part.

Access

```
import part
mdb.models[name].parts[name].allInternalSets[name].faces
mdb.models[name].parts[name].allInternalSurfaces[name].faces

```

FaceArray(...)

This method creates a FaceArray object.

Path

part.FaceArray

Required arguments

faces	A list of *Face* objects.

Optional arguments

None.

Return value

A FaceArray object.

Exceptions

None.

findAt(...)

This method returns the object or objects in the FaceArray located at the given coordinates.

`findAt` initially uses the ACIS tolerance of 1E-6. As a result, `findAt` returns any face that is at the arbitrary point specified or at a distance of less than 1E-6 from the arbitrary point. If nothing is found, `findAt` uses the tolerance for imprecise geometry (applicable only for imprecise geometric entities). The arbitrary point must not be shared by a second face. If two faces intersect or coincide at the arbitrary point, `findAt` chooses the first face that it encounters, and you should not rely on the return value being consistent.

`findAt` will always try to find objects among all the faces in the part or assembly instance and will not restrict itself to a subset even if the FaceArray represents such subset.

Required arguments

coordinates A sequence of Floats specifying the *X*-, *Y*-, and *Z*-coordinates of the object to find.

`findAt` returns either a Face object or a sequence of Face objects based on the type of input.

- If *coordinates* is a sequence of Floats, `findAt` returns the Face object at that point.
- If you omit the *coordinates* keyword argument, `findAt` accepts as arguments a sequence of pairs of sequences describing each face's coordinate and normal, and `findAt` returns a sequence of Face objects at the given locations. If you omit the *coordinates* keyword argument, you must also omit the *normal* argument.

```
faces = f.findAt(((-16.438578, -41.835673, -24.19804), ),
                 ((25.210364, -35.689868, 1.860314), ),
                 ((26.727683, -38.207055, 4.164759), ))
```

Optional arguments

normal A sequence of Floats specifying the *X*-, *Y*-, and *Z*-components of a vector indicating the face normal.

printWarning A Boolean specifying whether a message is to be printed to the CLI if no entity is found at the specified location. The default value is True.

Return value

A Face object.

Exceptions

None.

getExteriorEdges()

This method returns the edges on the exterior of the faces in the FaceArray. That is, it returns the edges that are referenced by exactly one of the faces in the sequence.

Arguments

None.

Return value

An EdgeArray object specifying the exterior edges.

Exceptions

None.

getSequenceFromMask(...)

This method returns the object or objects in the FaceArray identified using the specified *mask*. This command is generated when the *JournalOptions* are set to COMPRESSEDINDEX. When a large number of objects are involved, this method is highly efficient.

Required arguments

mask A String specifying the object or objects.

Optional arguments

None.

Return value

A Face object or a sequence of Face objects.

Exceptions

None.

getMask()

This method returns a string specifying the object or objects.

Arguments

None.

Return value

A String specifying the object or objects.

Exceptions

None.

getByBoundingBox(...)

This method returns an array of face objects that lie within the specified bounding box.

Required arguments

None.

Optional arguments

xMin	A float specifying the minimum *X*-boundary of the bounding box.
yMin	A float specifying the minimum *Y*-boundary of the bounding box.
zMin	A float specifying the minimum *Z*-boundary of the bounding box.
xMax	A float specifying the maximum *X*-boundary of the bounding box.
yMax	A float specifying the maximum *Y*-boundary of the bounding box.
zMax	A float specifying the maximum *Z*-boundary of the bounding box.

Return value

A FaceArray object, which is a sequence of *Face* objects.

Exceptions

None.

`getByBoundingCylinder(...)`

This method returns an array of face objects that lie within the specified bounding cylinder.

Required arguments

center1	A tuple of the *X*-, *Y*-, and *Z*-coordinates of the center of the first end of the cylinder.
center2	A tuple of the *X*-, *Y*-, and *Z*-coordinates of the center of the second end of the cylinder.
radius	A float specifying the radius of the cylinder.

Optional arguments

None.

Return value

A FaceArray object, which is a sequence of *Face* objects.

Exceptions

None.

`getByBoundingSphere(...)`

This method returns an array of face objects that lie within the specified bounding sphere.

Required arguments

center A tuple of the *X*-, *Y*-, and *Z*-coordinates of the center of the sphere.

radius A float specifying the radius of the sphere.

Optional arguments

None.

Return value

A FaceArray object, which is a sequence of *Face* objects.

Exceptions

None.

`getBoundingBox()`

This method returns a dictionary of two tuples representing minimum and maximum boundary values of the bounding box of the minimum size containing the face sequence.

Arguments

None.

Return value

A Dictionary object with the following items:

low: a tuple of three floats representing the minimum *X*-, *Y*-, and *Z*-boundary values of the bounding box.

high: a tuple of three floats representing the maximum *X*-, *Y*-, and *Z*-boundary values of the bounding box.

Exceptions

None.

`getClosest(...)`

This method returns an object or objects in the FaceArray closest to the given set of points, where the given points need not lie on the faces in the FaceArray.

Required arguments

coordinates A sequence of a sequence of floats, where each sequence of floats describes the *X*-, *Y*-, and *Z*-coordinates of a point.

```
r=f.getClosest(coordinates=((20.0,20.0,10.0),(-1.0, -15.0, 15),))

r.keys()

[0, 1]

r[0]

(mdb.models['Model-1'].parts['Part-1'].faces[0],
                                    (15.7090625762939, 20.0, 10.0))
```

Optional arguments

searchTolerance A double specifying the distance within which the closest object must lie. The default value is half of the parent part/instance size.

Return value

This method returns a dictionary object. The key to the dictionary object is the position of the input point in the tuple specified in the *coordinates* starting at index 0. If a closest face could be found then the value is a sequence consisting of two objects. The first object in the sequence is a *Face* that is close to the input point referred to by the key. The second object in the sequence is a sequence of floats that specifies the *X*-, *Y*-, and *Z*-location of the closest point on the *Face* to the given point. See program listing above.

Exceptions

An exception occurs if the resulting sequence is empty. Error: The mask results in an empty sequence

Members

The FaceArray object has no members.

IgnoredEdge object

An IgnoredEdge object is a one-dimensional region of geometry that has been abstracted away by a virtual topology feature.

Access

```
import part
mdb.models[name].parts[name].ignoredEdges[i]
import assembly
mdb.models[name].rootAssembly.allInstances[name].ignoredEdges[i]
mdb.models[name].rootAssembly.instances[name].ignoredEdges[i]
```

`getSize(...)`

This method returns a Float indicating the length of the edge.

Required arguments

None.

Optional arguments

printResults A Bool specifying whether verbose output is printed. The default is True.

Return value

A Float.

Exceptions

None.

`getRadius()`

This method returns the radius of a circular IgnoredEdge object.

Arguments

None.

Return value

A Float specifying the radius.

Exceptions

The given IgnoredEdge object is not circular.

`getCurvature(...)`

This method returns curvature information at a location on the IgnoredEdge object.

Required arguments

parameter A Float specifying the normalized parameter location on the IgnoredEdge where the curvature is to be computed. This argument is mutually exclusive with the argument *point*.

point A tuple of *X*-, *Y*-, and *Z*-coordinates of a point at which the curvature is to be computed. If *point* does not lie on the IgnoredEdge an attempt is made to project it onto the IgnoredEdge and use the projected point.

Optional arguments

None.

Return value

A dictionary with keys 'evaluationPoint', 'curvature', 'radius', 'tangent'. Where 'evaluationPoint' specifies the location at which the curvature was computed. 'curvature' specifies the curvature vector at that location. 'radius' is the Radius of curvature and 'tangent' specifies the tangent to the IgnoredEdge at that location.

Exceptions

The given IgnoredEdge is straight.

Members

The IgnoredEdge object has the following members:

index An Int specifying the index of the IgnoredEdge in the *IgnoredEdgeArray*.

pointOn A tuple of Floats specifying the *X*-, *Y*-, and *Z*-coordinates of a point located on the edge.

IgnoredEdgeArray object

The IgnoredEdgeArray is a sequence of *IgnoredEdge* objects. If the part is modified, then IgnoredEdgeArray must be updated for that part.

Access

```
import part
mdb.models[name].parts[name].ignoredEdges
import assembly
mdb.models[name].rootAssembly.allInstances[name].ignoredEdges
mdb.models[name].rootAssembly.instances[name].ignoredEdges
```

`findAt(...)`

This method returns the object or objects in the IgnoredEdgeArray located at the given coordinates.

`findAt` initially uses the ACIS tolerance of 1E-6. As a result, `findAt` returns any *IgnoredEdge* that is at the arbitrary point specified or at a distance of less than 1E-6 from the arbitrary point. If nothing is found, `findAt` uses the tolerance for imprecise geometry (applicable only for imprecise geometric entities). The arbitrary point must not be shared by a second *IgnoredEdge*. If two *IgnoredEdge* objects intersect or coincide at the arbitrary point, `findAt` chooses the first *IgnoredEdge* that it encounters, and you should not rely on the return value being consistent.

`findAt` will always try to find objects among all the ignored edges in the part or assembly instance and will not restrict itself to a subset even if the IgnoredEdgeArray represents such subset.

Required arguments

coordinates A sequence of Floats specifying the *X*-, *Y*-, and *Z*-coordinates of the object to find.

`findAt` returns either an *IgnoredEdge* object or a sequence of *IgnoredEdge* objects based on the type of input.

- If *coordinates* is a sequence of Floats, `findAt` returns the *IgnoredEdge* object at that point.
- If you omit the *coordinates* keyword argument, `findAt` accepts as arguments a sequence of sequence of floats in the following format:

```
ignoredEdges = e.findAt(((20.19686, -169.513997, 27.798593), ),
                        ((19.657627, -167.295749, 27.056402), ),
                        ((18.274129, -157.144741, 25.15218), ))
```

Optional arguments

printWarning A Boolean specifying whether a message is to be printed to the CLI if no entity is found at the specified location. The default value is True.

Return value

An *IgnoredEdge* object or a sequence of *IgnoredEdge* objects.

Exceptions

None.

getSequenceFromMask(...)

This method returns the object or objects in the IgnoredEdgeArray identified using the specified *mask*. This command is generated when the *JournalOptions* are set to COMPRESSEDINDEX. When large number of objects are involved, this method is highly efficient.

Required arguments

mask A String specifying the object or objects.

Optional arguments

None.

Return value

An *IgnoredEdge* object or a sequence of *IgnoredEdge* objects.

Exceptions

None.

getMask()

This method returns a string specifying the object or objects.

Arguments

None.

Return value

A String specifying the object or objects.

Exceptions

None.

getClosest(...)

This method returns a object or objects in the IgnoredEdgeArray closest to the given set of points, where the given points need not lie on the edges in the IgnoredEdgeArray.

Required arguments

coordinates A sequence of a sequence of floats, where each sequence of floats describes the *X*-, *Y*-, and *Z*-coordinates of a point.

```
r=e.getClosest(coordinates=((20.0,20.0,10.0),(-1.0, -15.0, 15),))

r.keys()

[0, 1]

r[0]

(mdb.models['Model-1'].parts['Part-1'].ignoredEdges[3],
                                    (15.7090625762939, 20.0, 10.0))
```

Optional arguments

searchTolerance A double specifying the distance within which the closest object must lie. The default value is half of the parent part/instance size.

Return value

This method returns a dictionary object. The key to the dictionary object is the position of the input point in the tuple specified in the *coordinates* starting at index 0. If a closest *IgnoredEdge* could be found then the value is a sequence consisting of two objects. The first object in the sequence is an *IgnoredEdge* that is close to the input point referred to by the key. The second object in the sequence, is a sequence of floats which specify the *X*-, *Y*-, and *Z*-location of the closest point on the *IgnoredEdge* to the given point. See program listing above.

Exceptions

An exception occurs if the resulting sequence is empty. Error: The mask results in an empty sequence

Members

The IgnoredEdgeArray object has no members.

IgnoredVertex object

An IgnoredVertex object is a point region of the geometry that was abstracted away by a virtual topology feature.

Access

```
import part
mdb.models[name].parts[name].ignoredVertices[i]
import assembly
mdb.models[name].rootAssembly.allInstances[name].ignoredVertices[i]
mdb.models[name].rootAssembly.instances[name].ignoredVertices[i]
```

Members

The IgnoredVertex object has the following members:

index
An Int specifying the index of the IgnoredVertex in the IgnoredVertexArray.

pointOn
A tuple of Floats specifying the *X*-, *Y*-, and *Z*-coordinates of the vertex.

IgnoredVertexArray object

The IgnoredVertexArray is a sequence of *IgnoredVertex* objects. If the part is modified, then IgnoredVertexArray must be updated for that part.

Access

```
import part
mdb.models[name].parts[name].ignoredVertices
import assembly
mdb.models[name].rootAssembly.allInstances[name].ignoredVertices
mdb.models[name].rootAssembly.instances[name].ignoredVertices
```

`findAt(...)`

This method returns the object or objects in the IgnoredVertexArray located at the given coordinates.

`findAt` initially uses the ACIS tolerance of 1E-6. As a result, `findAt` returns any *IgnoredVertex* object that is at the arbitrary point specified or at a distance of less than 1E-6 from the arbitrary point. If nothing is found, `findAt` uses the tolerance for imprecise geometry (applicable only for imprecise geometric entities).

`findAt` will always try to find objects among all the ignored vertices in the part or assembly instance and will not restrict itself to a subset even if the IgnoredVertexArray represents such subset.

Required arguments

coordinates A sequence of Floats specifying the *X*-, *Y*-, and *Z*-coordinates of the object to find.

`findAt` returns either a *IgnoredVertex* object or a sequence of *IgnoredVertex* objects based on the type of input.

- If *coordinates* is a sequence of Floats, `findAt` returns the *IgnoredVertex* object at that point.
- If you omit the *coordinates* keyword argument, `findAt` accepts as arguments a sequence of sequence of floats in the following format:

```
verts = v.findAt(((20.19686, -169.513997, 27.798593), ),
                 ((19.657627, -167.295749, 27.056402), ),
                 ((18.274129, -157.144741, 25.15218), ))
```

Optional arguments

printWarning A Boolean specifying whether a message is to be printed to the CLI if no entity is found at the specified location. The default value is True.

Return value

An *IgnoredVertex* object or a sequence of *IgnoredVertex* objects.

Exceptions

None.

getSequenceFromMask(...)

This method returns the object or objects in the IgnoredVertexArray identified using the specified *mask*. This command is generated when the *JournalOptions* are set to COMPRESSEDINDEX. When large number of objects are involved, this method is highly efficient.

Required arguments

mask A String specifying the object or objects.

Optional arguments

None.

Return value

An *IgnoredVertex* object or a sequence of *IgnoredVertex* objects.

Exceptions

None.

getMask()

This method returns a string specifying the object or objects.

Arguments

None.

Return value

A String specifying the object or objects.

Exceptions

None.

getClosest(...)

This method returns a object or objects in the IgnoredVertexArray closest to the given set of points, where the given points need not lie on the vertices in the IgnoredVertexArray.

Required arguments

coordinates A sequence of a sequence of floats, where each sequence of floats describes the *X*-, *Y*-, and *Z*-coordinates of a point.

```
r=e.getClosest(coordinates=((20.0,20.0,10.0),(-1.0, -15.0, 15),))

r.keys()

[0, 1]

r[0]

(mdb.models['Model-1'].parts['Part-1'].ignoredVertices[3],
                                    (15.7090625762939, 20.0, 10.0))
```

Optional arguments

searchTolerance A double specifying the distance within which the closest object must lie. The default value is half of the parent part/instance size.

Return value

This method returns a dictionary object. The key to the dictionary object is the position of the input point in the tuple specified in the *coordinates* starting at index 0. If a closest *IgnoredVertex* could be found then the value is a sequence consisting of two objects. The first object in the sequence is a *IgnoredVertex* that is close to the input point referred to by the key. The second object in the sequence, is a sequence of floats which specify the *X*-, *Y*-, and *Z*-location of the *IgnoredVertex*. See program listing above.

Exceptions

An exception occurs if the resulting sequence is empty. Error: The mask results in an empty sequence

Members

The IgnoredVertexArray object has no members.

InterestingPoint object

Interesting points can be located at the following:

- The middle of an edge.
- The middle of an arc.
- The center of an arc.

An InterestingPoint object is a temporary object and cannot be accessed from the *Mdb* object.

Access

```
import part
import assembly
```

InterestingPoint(...)

This method creates an interesting point along an edge. An InterestingPoint is a temporary object.

Path

mdb.models[*name*].parts[*name*].InterestingPoint

mdb.models[*name*].rootAssembly.instances[*name*].InterestingPoint

Required arguments

edge An Edge object specifying the edge on which the interesting point is positioned.

rule A SymbolicConstant specifying the position of the interesting point. Possible values are MIDDLE or CENTER.

Optional arguments

None.

Return value

An InterestingPoint object.

Exceptions

None.

Members

The InterestingPoint object has no members.

ModelDot object

The ModelDot object can be used to access an actual *MeshNode*, *ReferencePoint*, or *Vertex* object.

Members

The ModelDot object has no members.

ReferencePoint object

The ReferencePoint object has no direct constructor; it is created when a *Feature* object is created. The `ReferencePoint` method creates a *Feature* object that creates a ReferencePoint object.

Access

```
import part
mdb.models[name].parts[name].allInternalSets[name].referencePoints[i]
mdb.models[name].parts[name].allSets[name].referencePoints[i]
mdb.models[name].parts[name].referencePoints[i]
mdb.models[name].parts[name].sets[name].referencePoints[i]
import assembly
mdb.models[name].rootAssembly.allInstances[name].referencePoints[i]
mdb.models[name].rootAssembly.allInstances[name].sets[name]\
.referencePoints[i]
mdb.models[name].rootAssembly.allInternalSets[name].referencePoints[i]
mdb.models[name].rootAssembly.allSets[name].referencePoints[i]
mdb.models[name].rootAssembly.instances[name].referencePoints[i]
mdb.models[name].rootAssembly.instances[name].sets[name]\
.referencePoints[i]
mdb.models[name].rootAssembly.modelInstances[i].referencePoints[i]
mdb.models[name].rootAssembly.modelInstances[i].sets[name]\
.referencePoints[i]
mdb.models[name].rootAssembly.referencePoints[i]
mdb.models[name].rootAssembly.sets[name].referencePoints[i]
```

Members

The ReferencePoint object has no members.

Transform object

The `MakeSketchTransform` method creates a Transform object. The Transform object has no direct constructor. A Transform object is a 4×3 matrix of Floats that represents the transformation from sketch coordinates to assembly coordinates or to part coordinates.

Access

```
import part
import assembly
```

`matrix()`

This method returns the transformation matrix as a tuple of 12 Floats.

Arguments

None.

Return value

A tuple of 12 Floats.

Exceptions

None.

Members

The Transform object has no members.

Vertex object

Vertices are point regions of geometry.

Access

```
import part
mdb.models[name].parts[name].allInternalSets[name].vertices[i]
mdb.models[name].parts[name].allSets[name].vertices[i]
mdb.models[name].parts[name].sets[name].vertices[i]
mdb.models[name].parts[name].vertices[i]
import assembly
mdb.models[name].rootAssembly.allInstances[name].sets[name].vertices[i]
mdb.models[name].rootAssembly.allInstances[name].vertices[i]
mdb.models[name].rootAssembly.allInternalSets[name].vertices[i]
mdb.models[name].rootAssembly.allSets[name].vertices[i]
mdb.models[name].rootAssembly.instances[name].sets[name].vertices[i]
mdb.models[name].rootAssembly.instances[name].vertices[i]
mdb.models[name].rootAssembly.modelInstances[i].sets[name].vertices[i]
mdb.models[name].rootAssembly.modelInstances[i].vertices[i]
mdb.models[name].rootAssembly.sets[name].vertices[i]
mdb.models[name].rootAssembly.vertices[i]
```

`getEdges()`

This method returns a sequence consisting of the edge ids of the edges which share this vertex.

Arguments

None.

Return value

A tuple of integers.

Exceptions

None.

`getNodes()`

This method returns an array of node objects that are associated with the vertex.

Arguments

None.

Return value

A *MeshNodeArray* object which is a sequence of *MeshNode* objects.

Exceptions

None.

`getElements()`

This method returns an array of element objects that are associated with the vertex.

Arguments

None.

Return value

A *MeshElementArray* object which is a sequence of *MeshElement* objects.

Exceptions

None.

Members

The Vertex object has the following members:

index
An Int specifying the index of the Vertex in the VertexArray.

isReferenceRep
A Boolean specifying whether the vertex belongs to the reference representation of the Part or Instance.

pointOn
A tuple of Floats specifying the *X* -, *Y* -, and *Z* -coordinates of the vertex.

featureName
A tuple of Floats specifying the name of the feature that created this vertex.

instanceName
A tuple of Floats specifying the name of the part instance for this vertex (if applicable).

VertexArray object

The VertexArray is a sequence of *Vertex* objects. If the part is modified, then VertexArray must be updated for that part.

Access

```
import part
mdb.models[name].parts[name].allInternalSets[name].vertices
mdb.models[name].parts[name].allSets[name].vertices
mdb.models[name].parts[name].sets[name].vertices
mdb.models[name].parts[name].vertices
import assembly
mdb.models[name].rootAssembly.allInstances[name].sets[name].vertices
mdb.models[name].rootAssembly.allInstances[name].vertices
mdb.models[name].rootAssembly.allInternalSets[name].vertices
mdb.models[name].rootAssembly.allSets[name].vertices
mdb.models[name].rootAssembly.instances[name].sets[name].vertices
mdb.models[name].rootAssembly.instances[name].vertices
mdb.models[name].rootAssembly.modelInstances[i].sets[name].vertices
mdb.models[name].rootAssembly.modelInstances[i].vertices
mdb.models[name].rootAssembly.sets[name].vertices
mdb.models[name].rootAssembly.vertices
```

VertexArray(...)

This method creates a VertexArray object.

Path

part.VertexArray

Required arguments

vertices A list of *Vertex* objects.

Optional arguments

None.

Return value

A VertexArray object.

Exceptions

None.

findAt(...)

This method returns the object or objects in the VertexArray located at the given coordinates.

`findAt` initially uses the ACIS tolerance of 1E-6. As a result, `findAt` returns any *Vertex* object that is at the arbitrary point specified or at a distance of less than 1E-6 from the arbitrary point. If nothing is found, `findAt` uses the tolerance for imprecise geometry (applicable only for imprecise geometric entities).

`findAt` will always try to find objects among all the vertices in the part or assembly instance and will not restrict itself to a subset even if the VertexArray represents such subset.

Required arguments

coordinates A sequence of Floats specifying the *X*-, *Y*-, and *Z*-coordinates of the object to find.

`findAt` returns either a Vertex object or a sequence of Vertex objects based on the type of input.

- If *coordinates* is a sequence of Floats, `findAt` returns the Vertex object at that point.
- If you omit the *coordinates* keyword argument, `findAt` accepts as arguments a sequence of sequence of floats in the following format:

```
verts = v.findAt(((20.19686, -169.513997, 27.798593), ),
                 ((19.657627, -167.295749, 27.056402), ),
                 ((18.274129, -157.144741, 25.15218), ))
```

Optional arguments

printWarning A Boolean specifying whether a message is to be printed to the CLI if no entity is found at the specified location. The default value is True.

Return value

A Vertex object or a sequence of Vertex objects.

Exceptions

None.

`getSequenceFromMask(...)`

This method returns the object or objects in the VertexArray identified using the specified *mask*. This command is generated when the *JournalOptions* are set to COMPRESSEDINDEX. When a large number of objects are involved, this method is highly efficient.

Required arguments

mask A String specifying the object or objects.

Optional arguments

None.

Return value

A *Vertex* object or a sequence of *Vertex* objects.

Exceptions

None.

getMask()

This method returns a string specifying the object or objects.

Arguments

None.

Return value

A String specifying the object or objects.

Exceptions

None.

getByBoundingBox(...)

This method returns an array of vertex objects that lie within the specified bounding box.

Required arguments

None.

Optional arguments

xMin A float specifying the minimum *X*-boundary of the bounding box.

yMin A float specifying the minimum *Y*-boundary of the bounding box.

zMin A float specifying the minimum *Z*-boundary of the bounding box.

xMax A float specifying the maximum *X*-boundary of the bounding box.

yMax A float specifying the maximum *Y*-boundary of the bounding box.

zMax A float specifying the maximum *Z*-boundary of the bounding box.

Return value

A VertexArray object, which is a sequence of *Vertex* objects.

Exceptions

None.

getByBoundingCylinder(...)

This method returns an array of vertex objects that lie within the specified bounding cylinder.

Required arguments

center1	A tuple of the *X*-, *Y*-, and *Z*-coordinates of the center of the first end of the cylinder.
center2	A tuple of the *X*-, *Y*-, and *Z*-coordinates of the center of the second end of the cylinder.
radius	A float specifying the radius of the cylinder.

Optional arguments

None.

Return value

A VertexArray object, which is a sequence of *Vertex* objects.

Exceptions

None.

`getByBoundingSphere(...)`

This method returns an array of vertex objects that lie within the specified bounding sphere.

Required arguments

center	A tuple of the *X*-, *Y*-, and *Z*-coordinates of the center of the sphere.
radius	A float specifying the radius of the sphere.

Optional arguments

None.

Return value

A VertexArray object, which is a sequence of *Vertex* objects.

Exceptions

None.

`getBoundingBox()`

This method returns a dictionary of two tuples representing minimum and maximum boundary values of the bounding box of the minimum size containing the vertex sequence.

Arguments

None.

Return value

A Dictionary object with the following items:

low: a tuple of three floats representing the minimum *X*-, *Y*-, and *Z*-boundary values of the bounding box.

high: a tuple of three floats representing the maximum *X*-, *Y*-, and *Z*-boundary values of the bounding box.

Exceptions

None.

`getClosest(...)`

This method returns a object or objects in the VertexArray closest to the given set of points, where the given points need not lie on *Vertex* objects in the VertexArray.

Required arguments

coordinates A sequence of a sequence of floats, where each sequence of floats describes the *X*-, *Y*-, and *Z*-coordinates of a point.

```
r=v.getClosest(coordinates=((20.0,20.0,10.0),(-1.0, -15.0, 15),))
```

```
r.keys()
```

```
[0, 1]
```

```
r[0]
```

```
(mdb.models['Model-1'].parts['Part-1'].vertices[0],
        (15.7090625762939, 29.1666641235352, 20.0))
```

Optional arguments

searchTolerance A double specifying the distance within which the closest object must lie. The default value is half of the parent part/instance size.

Return value

This method returns a dictionary object. The key to the dictionary object is the position of the input point in the tuple specified in the *coordinates* starting at index 0. If a closest vertex could be found then the value is a sequence consisting of two objects. The first object in the sequence is a *Vertex* that is close to the input point referred to by the key. The second object in the sequence is a sequence of floats that specifies the *X*-, *Y*-, and *Z*-location of the *Vertex*. See program listing above.

Exceptions

An exception occurs if the resulting sequence is empty. Error: The mask results in an empty sequence

Members

The VertexArray object has no members.

Beam Section profile commands

The Beam Section profile commands are used to create profiles.
A profile definition specifies the properties of a beam that are related to its cross-section geometry. When you define a beam section, you must include a reference to a profile in the section definition.

In this section:

- *Profile object*
- *ArbitraryProfile object*
- *BoxProfile object*
- *ChannelProfile object*
- *CircularProfile object*
- *GeneralizedProfile object*
- *HatProfile object*
- *HexagonalProfile object*
- *IProfile object*
- *LProfile object*
- *PipeProfile object*
- *RectangularProfile object*
- *TProfile object*
- *TrapezoidalProfile object*

Profile object

The Profile object defines the geometrical properties of a beam cross-section. Profile is an abstract base type.

Access

```
import section
mdb.models[name].profiles[name]
import odbSection
session.odbs[name].profiles[name]
```

beamProfilesFromOdb(...)

This method creates Profile objects by reading an output database. The new profiles are placed in the profiles repository.

Path

mdb.models[*name*].beamProfilesFromOdb

Required arguments

fileName A String specifying the name of the output database file (including the `.odb` extension) to be read. The String can also be the full path to the output database file if it is located in another directory.

Optional arguments

None.

Return value

A list of Profile objects.

Exceptions

None.

Members

The Profile object has the following member:

name A String specifying the repository key.

ArbitraryProfile object

The ArbitraryProfile object defines the properties of an arbitrary profile.

The ArbitraryProfile object is derived from the *Profile* object.

Access

```
import section
mdb.models[name].profiles[name]
import odbSection
session.odbs[name].profiles[name]
```

ArbitraryProfile(...)

This method creates a ArbitraryProfile object.

Path

```
mdb.models[name].ArbitraryProfile
session.odbs[name].ArbitraryProfile
```

Required arguments

name	A String specifying the repository key.
table	A sequence of sequences of Floats specifying the items described below.

Optional arguments

None.

Table data

The first sequence in the table specifies the following:

- 1-coordinate of the first point defining the profile.
- 2-coordinate of the first point defining the profile.

All other sequences in the table specify the following:

- 1–coordinate of the next point defining the profile.
- 2–coordinate of the next point defining the profile.
- The thickness of the segment ending at that point.

Return value

An ArbitraryProfile object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the ArbitraryProfile object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ArbitraryProfile* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The ArbitraryProfile object has members with the same names and descriptions as the arguments to the *ArbitraryProfile* method.

Corresponding analysis keywords

- **BEAM SECTION*, SECTION=ARBITRARY

BoxProfile object

The BoxProfile object defines the properties of a box profile.

The BoxProfile object is derived from the *Profile* object.

Access

```
import section
mdb.models[name].profiles[name]
import odbSection
session.odbs[name].profiles[name]
```

BoxProfile(...)

This method creates a BoxProfile object.

Path

```
mdb.models[name].BoxProfile
session.odbs[name].BoxProfile
```

Required arguments

name A String specifying the repository key.

a A Float specifying the *a* dimension of the box profile. For more information, see *Beam Cross-Section Library*.

b A Float specifying the *b* dimension of the box profile.

uniformThickness A Boolean specifying whether the thickness is uniform.

t1 A Float specifying the uniform wall thickness if *uniformThickness*=ON, and the wall thickness of the first segment if *uniformThickness*=OFF.

Optional arguments

t2 A Float specifying the wall thickness of the second segment. *t2* is required only when *uniformThickness*=OFF. The default value is 0.0.

t3 A Float specifying the wall thickness of the third segment. *t3* is required only when *uniformThickness*=OFF. The default value is 0.0.

t4 A Float specifying the wall thickness of the fourth segment. *t4* is required only when *uniformThickness*=OFF. The default value is 0.0.

Return value

A BoxProfile object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the BoxProfile object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *BoxProfile* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The BoxProfile object has members with the same names and descriptions as the arguments to the *BoxProfile* method.

Corresponding analysis keywords

- **BEAM SECTION*, SECTION=BOX

ChannelProfile object

The ChannelProfile object defines the properties of a Channel profile.

The ChannelProfile object is derived from the *Profile* object.

Access

```
import section
mdb.models[name].profiles[name]
import odbSection
session.odbs[name].profiles[name]
```

ChannelProfile(...)

This method creates a ChannelProfile object.

Path

```
mdb.models[name].ChannelProfile
session.odbs[name].ChannelProfile
```

Required arguments

name A String specifying the repository key.

l A positive Float specifying the *l* dimension (offset of 1–axis from the bottom flange surface) of the Channel profile. For more information, see *Beam Cross-Section Library*.

h A positive Float specifying the *h* dimension (height) of the Channel profile.

b1 A positive Float specifying the *b1* dimension (lower flange width) of the Channel profile.

b2 A positive Float specifying the *b2* dimension (upper flange width) of the Channel profile.

t1 A positive Float specifying the *t1* dimension (lower flange thickness) of the Channel profile.

t2 A positive Float specifying the *t2* dimension (upper flange thickness) of the Channel profile.

t3 A positive Float specifying the *t3* dimension (web thickness) of the Channel profile.

o A positive Float specifying the *o* dimension (offset of 2–axis from the left edge of web) of the Channel profile.

Optional arguments

None.

Return value

A ChannelProfile object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the ChannelProfile object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ChannelProfile* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The ChannelProfile object has members with the same names and descriptions as the arguments to the *ChannelProfile* method.

Corresponding analysis keywords

- **BEAM SECTION*, SECTION=CHANNEL

CircularProfile object

The CircularProfile object defines the properties of a solid circular profile.

The CircularProfile object is derived from the *Profile* object.

Access

```
import section
mdb.models[name].profiles[name]
import odbSection
session.odbs[name].profiles[name]
```

CircularProfile(...)

This method creates a CircularProfile object.

Path

```
mdb.models[name].CircularProfile
session.odbs[name].CircularProfile
```

Required arguments

name A String specifying the repository key.

r A positive Float specifying the *r* dimension (outer radius) of the circular profile. For more information, see *Beam Cross-Section Library*.

Optional arguments

None.

Return value

A CircularProfile object.

Exceptions

RangeError.

setValues(...)

This method modifies the CircularProfile object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *CircularProfile* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The CircularProfile object has members with the same names and descriptions as the arguments to the *CircularProfile* method.

Corresponding analysis keywords

- **BEAM SECTION*, SECTION=CIRC

GeneralizedProfile object

The GeneralizedProfile object defines the properties of a profile via its area, moment of inertia, etc.

The GeneralizedProfile object is derived from the *Profile* object.

Access

```
import section
mdb.models[name].profiles[name]
import odbSection
session.odbs[name].profiles[name]
```

GeneralizedProfile(...)

This method creates a GeneralizedProfile object.

Path

```
mdb.models[name].GeneralizedProfile
session.odbs[name].GeneralizedProfile
```

Required arguments

name A String specifying the repository key.

area A Float specifying the cross-sectional area for the profile.

i11 A Float specifying the moment of inertia for bending about the 1-axis, I_{11}.

i12 A Float specifying the moment of inertia for cross bending, I_{12}.

i22 A Float specifying the moment of inertia for bending about the 2-axis, I_{22}.

j A Float specifying the torsional constant, J.

gammaO A Float specifying the sectorial moment, Γ_0.

gammaW A Float specifying the warping constant, Γ_W.

Optional arguments

None.

Return value

A GeneralizedProfile object.

Exceptions

RangeError.

setValues(...)

This method modifies the GeneralizedProfile object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *GeneralizedProfile* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The GeneralizedProfile object has members with the same names and descriptions as the arguments to the *GeneralizedProfile* method.

Corresponding analysis keywords

- **BEAM GENERAL SECTION*, SECTION=GENERAL or NONLINEAR GENERAL

HatProfile object

The HatProfile object defines the properties of a Hat profile.

The HatProfile object is derived from the *Profile* object.

Access

```
import section
mdb.models[name].profiles[name]
import odbSection
session.odbs[name].profiles[name]
```

HatProfile(...)

This method creates a HatProfile object.

Path

```
mdb.models[name].HatProfile
session.odbs[name].HatProfile
```

Required arguments

name A String specifying the repository key.

l A positive Float specifying the *l* dimension (offset of 1–axis from the bottom flange surface) of the Hat profile. For more information, see *Beam Cross-Section Library*.

h A positive Float specifying the *h* dimension (height) of the Hat profile.

b A positive Float specifying the *b* dimension (bottom width) of the Hat profile.

b1 A positive Float specifying the *b1* dimension (upper flange width) of the Hat profile.

b2 A positive Float specifying the *b2* dimension (lower flange width) of the Hat profile.

t1 A positive Float specifying the *t1* dimension (upper flange thickness) of the Hat profile.

t2 A positive Float specifying the *t2* dimension (lower flange thickness) of the Hat profile.

t3 A positive Float specifying the *t3* dimension (web thickness) of the Hat profile.

Optional arguments

None.

Return value

A HatProfile object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the HatProfile object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *HatProfile* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The HatProfile object has members with the same names and descriptions as the arguments to the *HatProfile* method.

Corresponding analysis keywords

HexagonalProfile object

The HexagonalProfile object defines the properties of a hexagonal profile.

The HexagonalProfile object is derived from the *Profile* object.

Access

```
import section
mdb.models[name].profiles[name]
import odbSection
session.odbs[name].profiles[name]
```

HexagonalProfile(...)

This method creates a HexagonalProfile object.

Path

```
mdb.models[name].HexagonalProfile
session.odbs[name].HexagonalProfile
```

Required arguments

name A String specifying the repository key.

r A positive Float specifying the *r* dimension (outer radius) of the hexagonal profile. For more information, see *Beam Cross-Section Library*.

t A positive Float specifying the *t* dimension (wall thickness) of the hexagonal profile, $t < (sqrt(3)/2)r$.

Optional arguments

None.

Return value

A HexagonalProfile object.

Exceptions

RangeError.

setValues(...)

This method modifies the HexagonalProfile object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *HexagonalProfile* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The HexagonalProfile object has members with the same names and descriptions as the arguments to the *HexagonalProfile* method.

IProfile object

The IProfile object defines the properties of an I profile.

The IProfile object is derived from the *Profile* object.

Access

```
import section
mdb.models[name].profiles[name]
import odbSection
session.odbs[name].profiles[name]
```

IProfile(...)

This method creates an IProfile object.

Path

```
mdb.models[name].IProfile
session.odbs[name].IProfile
```

Required arguments

name A String specifying the repository key.

l A Float specifying the *l* dimension (offset of 1–axis from the bottom flange surface) of the I profile. For more information, see *Beam Cross-Section Library*.

h A Float specifying the *h* dimension (height) of the I profile.

b1 A Float specifying the *b1* dimension (bottom flange width) of the I profile.

b2 A Float specifying the *b2* dimension (top flange width) of the I profile.

t1 A Float specifying the *t1* dimension (bottom flange thickness) of the I profile.

t2 A Float specifying the *t2* dimension (top flange thickness) of the I profile.

t3 A Float specifying the *t3* dimension (web thickness) of the I profile.

Optional arguments

None.

Return value

An IProfile object.

Exceptions

RangeError.

setValues(...)

This method modifies the IProfile object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *IProfile* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Boundary Condition commands

A specific type of boundary condition object and a specific type of boundary condition state object are designed for each type of boundary condition. A BoundaryCondition object stores the non-propagating data of a boundary condition as well as a number of instances of the corresponding BoundaryConditionState object, each of which stores the propagating data of the boundary condition in a single step.
Instances of the BoundaryConditionState object are created and deleted internally by its corresponding BoundaryCondition object.

In this section:

- *BoundaryCondition object*
- *AccelerationBaseMotionBC object*
- *AccelerationBaseMotionBCState object*
- *AccelerationBC object*
- *AccelerationBCState object*

BoundaryCondition object

The BoundaryCondition object is the abstract base type for other BoundaryCondition objects. The BoundaryCondition object has no explicit constructor. The methods and members of the BoundaryCondition object are common to all objects derived from the BoundaryCondition.

Access

```
import load
mdb.models[name].boundaryConditions[name]
```

deactivate(...)

This method deactivates the boundary condition in the specified step and all subsequent steps.

Required arguments

stepName A String specifying the name of the step in which the boundary condition is deactivated.

Optional arguments

None.

Return value

None.

Exceptions

TextError.

move(...)

This method moves the boundary condition state from one step to a different step.

Required arguments

fromStepName A String specifying the name of the step from which the boundary condition state is moved.

toStepName A String specifying the name of the step to which the boundary condition state is moved.

Optional arguments

None.

Return value

None.

Exceptions

TextError.

reset(...)

This method resets the boundary condition state of the specified step to the state of the previous analysis step.

Required arguments

stepName	A String specifying the name of the step in which the boundary condition state is reset.

Optional arguments

None.

Return value

`None.`

Exceptions

TextError.

resume()

This method resumes the boundary condition that was previously suppressed.

Arguments

None.

Return value

`None.`

Exceptions

None.

suppress()

This method suppresses the boundary condition.

Arguments

None.

Return value

`None.`

Exceptions

None.

`delete(...)`

This method allows you to delete existing boundary conditions.

Required arguments

indices A sequence of Ints specifying the index of each boundary condition to delete.

Optional arguments

None.

Return value

`None`.

Exceptions

None.

Members

The BoundaryCondition object can have the following members:

name A String specifying the boundary condition repository key.

category A SymbolicConstant specifying the category of the boundary condition. Possible values are MECHANICAL and THERMAL.

region A *Region* object specifying the region to which the boundary condition is applied.

localCsys `None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

AccelerationBaseMotionBC object

The AccelerationBaseMotionBC object stores the data for an acceleration base motion boundary condition.

The AccelerationBaseMotionBC object is derived from the *BoundaryCondition* object.

Access

```
import load
mdb.models[name].boundaryConditions[name]
```

AccelerationBaseMotionBC(...)

This method creates a AccelerationBaseMotionBC object.

Path

```
mdb.models[name].AccelerationBaseMotionBC
```

Required arguments

name A String specifying the boundary condition repository key.

createStepName A String specifying the name of the step in which the boundary condition is created.

dof A SymbolicConstant specifying the constrained degree-of-freedom. Possible values for the SymbolicConstant are U1, U2, U3, UR1, UR2, UR3. The default value is U1.

Optional arguments

amplitudeScaleFactor A Float specifying the scale factor for the amplitude curve. The default value is 1.0.

centerOfRotation A *ModelDot* object specifying a tuple containing one center of rotation. The default value is the global origin. This argument applies only when *dof*=UR1, UR2, or UR3.

correlation A *CorrelationArray* object.

secondaryBase A String specifying the name of the *SecondaryBaseBC* object associated with this boundary condition. The default value is an empty string.

useComplex A Boolean specifying whether to define the imaginary (out-of-plane) portion of the base motion record given by amplitude definition. The default value is OFF.

amplitude A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the boundary condition has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

An AccelerationBaseMotionBC object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing AccelerationBaseMotionBC object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *AccelerationBaseMotionBC* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing AccelerationBaseMotionBC object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the boundary condition is modified.

Optional arguments

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the boundary condition is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The AccelerationBaseMotionBC object can have the following members:

name

A String specifying the boundary condition repository key.

amplitudeScaleFactor

A Float specifying the scale factor for the amplitude curve. The default value is 1.0.

useComplex

A Boolean specifying whether to define the imaginary (out-of-plane) portion of the base motion record given by amplitude definition. The default value is OFF.

centerOfRotation

A *ModelDot* object specifying a tuple containing one center of rotation. The default value is the global origin. This argument applies only when *dof*=UR1, UR2, or UR3.

correlation

A *CorrelationArray* object.

secondaryBase

A String specifying the name of the *SecondaryBaseBC* object associated with this boundary condition. The default value is an empty string.

category

A SymbolicConstant specifying the category of the boundary condition. Possible values are MECHANICAL and THERMAL.

region

A *Region* object specifying the region to which the boundary condition is applied.

localCsys

`None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

AccelerationBaseMotionBCState object

The AccelerationBaseMotionBCState object stores the propagating data for a velocity base motion boundary condition in a step. One instance of this object is created internally by the *AccelerationBaseMotionBC* object for each step. The instance is also deleted internally by the *AccelerationBaseMotionBC* object.

The AccelerationBaseMotionBCState object has no constructor or methods.

The AccelerationBaseMotionBCState object is derived from the *BoundaryConditionState* object.

Access

```
import load
mdb.models[name].steps[name].boundaryConditionStates[name]
```

Members

The AccelerationBaseMotionBCState object has the following members:

amplitudeState

A SymbolicConstant specifying the propagation state of the amplitude reference. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

status

A SymbolicConstant specifying the propagation state of the *BoundaryConditionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- PROPAGATED_FROM_BASE_STATE
- MODIFIED_FROM_BASE_STATE
- DEACTIVATED_FROM_BASE_STATE
- BUILT_INTO_MODES

amplitude

A String specifying the name of the amplitude reference. The String is empty if the boundary condition has no amplitude reference.

Corresponding analysis keywords

- **BASE MOTION*

AccelerationBC object

The AccelerationBC object stores the data for an acceleration boundary condition.

The AccelerationBC object is derived from the *BoundaryCondition* object.

Access

```
import load
mdb.models[name].boundaryConditions[name]
```

AccelerationBC(...)

This method creates an AccelerationBC object.

Path

```
mdb.models[name].AccelerationBC
```

Required arguments

name A String specifying the boundary condition repository key.

createStepName A String specifying the name of the step in which the boundary condition is created.

region A *Region* object specifying the region to which the boundary condition is applied.

Optional arguments

fieldName A String specifying the name of the *AnalyticalField* object associated with this boundary condition. The *fieldName* argument applies only when *distributionType*=FIELD. The default value is an empty string.

a1 A Float or a SymbolicConstant specifying the acceleration component in the 1-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

Note:

Although *a1*, *a2*, *a3*, *ar1*, *ar2*, and *ar3* are optional arguments, at least one of them must be specified.

a2 A Float or a SymbolicConstant specifying the acceleration component in the 2-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

a3 A Float or a SymbolicConstant specifying the acceleration component in the 3-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

ar1 A Float or a SymbolicConstant specifying the rotational acceleration component about the 1-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

ar2
A Float or a SymbolicConstant specifying the rotational acceleration component about the 2-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

ar3
A Float or a SymbolicConstant specifying the rotational acceleration component about the 3-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

amplitude
A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the boundary condition has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

localCsys
`None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

distributionType
A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

Return value

An AccelerationBC object.

Exceptions

None.

`setValues(...)`

This method modifies the data for an existing AccelerationBC object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *AccelerationBC* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing AccelerationBC object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the boundary condition is modified.

Optional arguments

a1 A Float or a SymbolicConstant specifying the acceleration component in the 1-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

a2 A Float or a SymbolicConstant specifying the acceleration component in the 2-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

a3 A Float or a SymbolicConstant specifying the acceleration component in the 3-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

ar1 A Float or a SymbolicConstant specifying the rotational acceleration component about the 1-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

ar2 A Float or a SymbolicConstant specifying the rotational acceleration component about the 2-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

ar3 A Float or a SymbolicConstant specifying the rotational acceleration component about the 3-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the boundary condition is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The AccelerationBC object can have the following members:

name A String specifying the boundary condition repository key.

distributionType A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

fieldName A String specifying the name of the *AnalyticalField* object associated with this boundary condition. The *fieldName* argument applies only when *distributionType*=FIELD. The default value is an empty string.

category

A SymbolicConstant specifying the category of the boundary condition. Possible values are MECHANICAL and THERMAL.

region

A *Region* object specifying the region to which the boundary condition is applied.

localCsys

`None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

AccelerationBCState object

The AccelerationBCState object stores the propagating data of an acceleration boundary condition in a step. One instance of this object is created internally by the *AccelerationBC* object for each step. The instance is also deleted internally by the *AccelerationBC* object.

The AccelerationBCState object has no constructor or methods.

The AccelerationBCState object is derived from the *BoundaryConditionState* object.

Access

```
import load
mdb.models[name].steps[name].boundaryConditionStates[name]
```

Members

The AccelerationBCState object has the following members:

a1

A Float specifying the acceleration component in the 1-direction.

a2

A Float specifying the acceleration component in the 2-direction.

a3

A Float specifying the acceleration component in the 3-direction.

ar1

A Float specifying the rotational acceleration component about the 1-direction.

ar2

A Float specifying the rotational acceleration component about the 2-direction.

ar3

A Float specifying the rotational acceleration component about the 3-direction.

a1State

A SymbolicConstant specifying the propagation state of the acceleration component in the 1-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

a2State

A SymbolicConstant specifying the propagation state of the acceleration component in the 2-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

a3State

A SymbolicConstant specifying the propagation state of the acceleration component in the 3-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

ar1State

A SymbolicConstant specifying the propagation state of the rotational acceleration component about the 1-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

ar2State

A SymbolicConstant specifying the propagation state of the rotational acceleration component about the 2-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

ar3State

A SymbolicConstant specifying the propagation state of the rotational acceleration component about the 3-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

amplitudeState

A SymbolicConstant specifying the propagation state of the amplitude reference. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

status

A SymbolicConstant specifying the propagation state of the *BoundaryConditionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- PROPAGATED_FROM_BASE_STATE
- MODIFIED_FROM_BASE_STATE
- DEACTIVATED_FROM_BASE_STATE
- BUILT_INTO_MODES

amplitude

A String specifying the name of the amplitude reference. The String is empty if the boundary condition has no amplitude reference.

Corresponding analysis keywords

- **BOUNDARY*, TYPE=ACCELERATION (degree of freedom: 1, 2, 3, 4, 5, or 6)

AcousticPressureBC object

The AcousticPressureBC object stores the data for an acoustic pressure boundary condition.

The AcousticPressureBC object is derived from the *BoundaryCondition* object.

Access

```
import load
mdb.models[name].boundaryConditions[name]
```

AcousticPressureBC(...)

This method creates a AcousticPressureBC object.

Path

```
mdb.models[name].AcousticPressureBC
```

Required arguments

name A String specifying the boundary condition repository key.

createStepName A String specifying the name of the step in which the boundary condition is created.

region A *Region* object specifying the region to which the boundary condition is applied.

Optional arguments

fieldName A String specifying the name of the *AnalyticalField* object associated with this boundary condition. The *fieldName* argument applies only when *distributionType*=FIELD. The default value is an empty string.

magnitude A Float specifying the acoustic pressure magnitude. The default value is 0. The *magnitude* argument is optional if *distributionType*=USER_DEFINED.

distributionType A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

amplitude A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the boundary condition has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

fixed A Boolean specifying whether the boundary condition should remain fixed at the current values at the start of the step. The default value is OFF.

Return value

An AcousticPressureBC object.

Exceptions

None.

`setValues(...)`

This method modifies the data for an existing AcousticPressureBC object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *AcousticPressureBC* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing AcousticPressureBC object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the boundary condition is modified.

Optional arguments

magnitude A Float or the SymbolicConstant FREED specifying the acoustic pressure magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the boundary condition is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The AcousticPressureBC object can have the following members:

name

A String specifying the boundary condition repository key.

distributionType

A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

fieldName

A String specifying the name of the *AnalyticalField* object associated with this boundary condition. The *fieldName* argument applies only when *distributionType*=FIELD. The default value is an empty string.

category

A SymbolicConstant specifying the category of the boundary condition. Possible values are MECHANICAL and THERMAL.

region

A *Region* object specifying the region to which the boundary condition is applied.

localCsys

`None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

AcousticPressureBCState object

The AcousticPressureBCState object stores the propagating data for an acoustic pressure boundary condition in a step. One instance of this object is created internally by the *AcousticPressureBC* object for each step. The instance is also deleted internally by the *AcousticPressureBC* object.

The AcousticPressureBCState object has no constructor or methods.

The AcousticPressureBCState object is derived from the *BoundaryConditionState* object.

Access

```
import load
mdb.models[name].steps[name].boundaryConditionStates[name]
```

Members

The AcousticPressureBCState object has the following members:

magnitude

A Float specifying the acoustic pressure magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the acoustic pressure magnitude. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

amplitudeState

A SymbolicConstant specifying the propagation state of the amplitude reference. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

status

A SymbolicConstant specifying the propagation state of the *BoundaryConditionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- PROPAGATED_FROM_BASE_STATE
- MODIFIED_FROM_BASE_STATE
- DEACTIVATED_FROM_BASE_STATE
- BUILT_INTO_MODES

amplitude

A String specifying the name of the amplitude reference. The String is empty if the boundary condition has no amplitude reference.

Corresponding analysis keywords

- **BOUNDARY* (degree of freedom: 8)

BoundaryConditionState object

The BoundaryConditionState object is the abstract base type for other BoundaryConditionState objects. The BoundaryConditionState object has no explicit constructor or methods. The members of the BoundaryConditionState object are common to all objects derived from the BoundaryConditionState object.

Access

```
import load
mdb.models[name].steps[name].boundaryConditionStates[name]
```

Members

The BoundaryConditionState object has the following members:

amplitudeState

A SymbolicConstant specifying the propagation state of the amplitude reference. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

status

A SymbolicConstant specifying the propagation state of the BoundaryConditionState object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- PROPAGATED_FROM_BASE_STATE
- MODIFIED_FROM_BASE_STATE
- DEACTIVATED_FROM_BASE_STATE
- BUILT_INTO_MODES

amplitude

A String specifying the name of the amplitude reference. The String is empty if the boundary condition has no amplitude reference.

ConcentrationBC object

The ConcentrationBC object stores the data for a concentration boundary condition.

The ConcentrationBC object is derived from the *BoundaryCondition* object.

Access

```
import load
mdb.models[name].boundaryConditions[name]
```

ConcentrationBC(...)

This method creates a ConcentrationBC object.

Path

```
mdb.models[name].ConcentrationBC
```

Required arguments

name A String specifying the boundary condition repository key.

createStepName A String specifying the name of the step in which the boundary condition is created.

region A *Region* object specifying the region to which the boundary condition is applied.

Optional arguments

fieldName A String specifying the name of the *AnalyticalField* object associated with this boundary condition. The *fieldName* argument applies only when *distributionType*=FIELD. The default value is an empty string.

magnitude A Float specifying the concentration magnitude. The default value is 0. The *magnitude* argument is optional if *distributionType*=USER_DEFINED.

distributionType A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

amplitude A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the boundary condition has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

fixed A Boolean specifying whether the boundary condition should remain fixed at the current values at the start of the step. The default value is OFF.

Return value

A ConcentrationBC object.

Exceptions

None.

`setValues(...)`

This method modifies the data for an existing ConcentrationBC object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConcentrationBC* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing ConcentrationBC object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the boundary condition is modified.

Optional arguments

magnitude A Float or the SymbolicConstant FREED specifying the concentration magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the boundary condition is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The ConcentrationBC object can have the following members:

name

A String specifying the boundary condition repository key.

distributionType

A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

fieldName

A String specifying the name of the *AnalyticalField* object associated with this boundary condition. The *fieldName* argument applies only when *distributionType*=FIELD. The default value is an empty string.

category

A SymbolicConstant specifying the category of the boundary condition. Possible values are MECHANICAL and THERMAL.

region

A *Region* object specifying the region to which the boundary condition is applied.

localCsys

`None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

ConcentrationBCState object

The ConcentrationBCState object stores the propagating data for a concentration boundary condition in a step. One instance of this object is created internally by the *ConcentrationBC* object for each step. The instance is also deleted internally by the *ConcentrationBC* object.

The ConcentrationBCState object has no constructor or methods.

The ConcentrationBCState object is derived from the *BoundaryConditionState* object.

Access

```
import load
mdb.models[name].steps[name].boundaryConditionStates[name]
```

Members

The ConcentrationBCState object has the following members:

magnitude

A Float specifying the concentration magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the concentration magnitude. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

amplitudeState

A SymbolicConstant specifying the propagation state of the amplitude reference. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

status

A SymbolicConstant specifying the propagation state of the *BoundaryConditionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- PROPAGATED_FROM_BASE_STATE
- MODIFIED_FROM_BASE_STATE
- DEACTIVATED_FROM_BASE_STATE
- BUILT_INTO_MODES

amplitude

A String specifying the name of the amplitude reference. The String is empty if the boundary condition has no amplitude reference.

Corresponding analysis keywords

- **BOUNDARY* (degree of freedom: 11)

ConnAccelerationBC object

The ConnAccelerationBC object stores the data for a connector acceleration boundary condition.

The ConnAccelerationBC object is derived from the *BoundaryCondition* object.

Access

```
import load
mdb.models[name].boundaryConditions[name]
```

ConnAccelerationBC(...)

This method creates an ConnAccelerationBC object on a wire region. Alternatively, the boundary condition may also be applied to a wire set referenced from an assembled fastener template model.

Path

```
mdb.models[name].ConnAccelerationBC
```

Required arguments

name
A String specifying the boundary condition repository key.

createStepName
A String specifying the name of the step in which the boundary condition is created.

Optional arguments

region
The wire region to which the boundary condition is applied. This argument is not valid when *fastenerName* and *fastenerSetName* are specified.

fastenerName
A String specifying the name of the assembled fastener to which the boundary condition will be applied. This argument is not valid when *region* is specified. When this argument is specified, *fastenerSetName* must also be specified. The default value is an empty string.

fastenerSetName
A String specifying the assembled fastener template model set to which the boundary condition will be applied. This argument is not valid when *region* is specified. When this argument is specified, *fastenerName* must also be specified. The default value is an empty string.

a1
A Float or a SymbolicConstant specifying the acceleration component in the connector's local 1-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

Note:

Although *a1*, *a2*, *a3*, *ar1*, *ar2*, and *ar3* are optional arguments, at least one of them must be specified.

a2
A Float or a SymbolicConstant specifying the acceleration component in the connector's local 2-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

a3
A Float or a SymbolicConstant specifying the acceleration component in the connector's local 3-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

ar1
A Float or a SymbolicConstant specifying the rotational acceleration component in the connector's local 4-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

ar2
A Float or a SymbolicConstant specifying the rotational acceleration component in the connector's local 5-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

ar3
A Float or a SymbolicConstant specifying the rotational acceleration component in the connector's local 6-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

amplitude
A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the boundary condition has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

distributionType
A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM and USER_DEFINED. The default value is UNIFORM.

Return value

A ConnAccelerationBC object.

Exceptions

None.

`setValues(...)`

This method modifies the data for an existing ConnAccelerationBC object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConnAccelerationBC* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing ConnAccelerationBC object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the boundary condition is modified.

Optional arguments

a1 A Float or a SymbolicConstant specifying the connector acceleration component in the connector's local 1-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

a2 A Float or a SymbolicConstant specifying the connector acceleration component in the connector's local 2-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

a3 A Float or a SymbolicConstant specifying the connector acceleration component in the connector's local 3-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

ar1 A Float or a SymbolicConstant specifying the connector acceleration component in the connector's local 4-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

ar2 A Float or a SymbolicConstant specifying the connector acceleration component in the connector's local 5-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

ar3 A Float or a SymbolicConstant specifying the connector acceleration component in the connector's local 6-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the boundary condition is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The ConnAccelerationBC object can have the following members:

name A String specifying the boundary condition repository key.

distributionType

A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM and USER_DEFINED. The default value is UNIFORM.

fastenerName

A String specifying the name of the assembled fastener to which the boundary condition will be applied. This argument is not valid when *region* is specified. When this argument is specified, *fastenerSetName* must also be specified. The default value is an empty string.

fastenerSetName

A String specifying the assembled fastener template model set to which the boundary condition will be applied. This argument is not valid when *region* is specified. When this argument is specified, *fastenerName* must also be specified. The default value is an empty string.

category

A SymbolicConstant specifying the category of the boundary condition. Possible values are MECHANICAL and THERMAL.

region

A *Region* object specifying the region to which the boundary condition is applied.

localCsys

`None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

ConnAccelerationBCState object

The ConnAccelerationBCState object stores the propagating data of a connector acceleration boundary condition in a step. One instance of this object is created internally by the *ConnAccelerationBC* object for each step. The instance is also deleted internally by the *ConnAccelerationBC* object.

The ConnAccelerationBCState object has no constructor or methods.

The ConnAccelerationBCState object is derived from the *BoundaryConditionState* object.

Access

```
import load
mdb.models[name].steps[name].boundaryConditionStates[name]
```

Members

The ConnAccelerationBCState object has the following members:

a1

A Float specifying the connector acceleration component in the connector's local 1-direction.

a2

A Float specifying the connector acceleration component in the connector's local 2-direction.

a3

A Float specifying the connector acceleration component in the connector's local 3-direction.

ar1

A Float specifying the connector acceleration component in the connector's local 4-direction.

ar2

A Float specifying the connector acceleration component in the connector's local 5-direction.

ar3

A Float specifying the connector acceleration component in the connector's local 6-direction.

a1State

A SymbolicConstant specifying the propagation state of the connector acceleration component in the connector's local 1-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

a2State

A SymbolicConstant specifying the propagation state of the connector acceleration component in the connector's local 2-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

a3State

A SymbolicConstant specifying the propagation state of the connector acceleration component in the connector's local 3-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

ar1State

A SymbolicConstant specifying the propagation state of the connector acceleration component in the connector's local 4-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

ar2State

A SymbolicConstant specifying the propagation state of the connector acceleration component in the connector's local 5-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

ar3State

A SymbolicConstant specifying the propagation state of the connector acceleration component in the connector's local 6-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

amplitudeState

A SymbolicConstant specifying the propagation state of the amplitude reference. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

status

A SymbolicConstant specifying the propagation state of the *BoundaryConditionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- PROPAGATED_FROM_BASE_STATE
- MODIFIED_FROM_BASE_STATE
- DEACTIVATED_FROM_BASE_STATE
- BUILT_INTO_MODES

amplitude

A String specifying the name of the amplitude reference. The String is empty if the boundary condition has no amplitude reference.

Corresponding analysis keywords

- **CONNECTOR MOTION*, TYPE=ACCELERATION (degree of freedom: 1, 2, 3, 4, 5, or 6)

ConnDisplacementBC object

The ConnDisplacementBC object stores the data for a connector displacement/rotation boundary condition.

The ConnDisplacementBC object is derived from the *BoundaryCondition* object.

Access

```
import load
mdb.models[name].boundaryConditions[name]
```

ConnDisplacementBC(...)

This method creates a ConnDisplacementBC object on a wire region. Alternatively, the boundary condition may also be applied to a wire set referenced from an assembled fastener template model.

Path

```
mdb.models[name].ConnDisplacementBC
```

Required arguments

name
A String specifying the boundary condition repository key.

createStepName
A String specifying the name of the step in which the boundary condition is created.

Optional arguments

region
The wire region to which the boundary condition is applied. This argument is not valid when *fastenerName* and *fastenerSetName* are specified.

fastenerName
A String specifying the name of the assembled fastener to which the boundary condition will be applied. This argument is not valid when *region* is specified. When this argument is specified, *fastenerSetName* must also be specified. The default value is an empty string.

fastenerSetName
A String specifying the assembled fastener template model set to which the boundary condition will be applied. This argument is not valid when *region* is specified. When this argument is specified, *fastenerName* must also be specified. The default value is an empty string.

u1
A Float, a Complex, or a SymbolicConstant specifying the displacement component in the connector's local 1-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

Note:

Although *u1*, *u2*, *u3*, *ur1*, *ur2*, and *ur3* are optional arguments, at least one of them must be specified.

u2
A Float, a Complex, or a SymbolicConstant specifying the displacement component in the connector's local 2-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

u3
A Float, a Complex, or a SymbolicConstant specifying the displacement component in the connector's local 3-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

ur1
A Float, a Complex, or a SymbolicConstant specifying the rotational component in the connector's local 4-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

ur2
A Float, a Complex, or a SymbolicConstant specifying the rotational component in the connector's local 5-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

ur3
A Float, a Complex, or a SymbolicConstant specifying the rotational component in the connector's local 6-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

fixed
A Boolean specifying whether the boundary condition should remain fixed at the current values at the start of the step. The default value is OFF.

amplitude
A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the boundary condition has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

distributionType
A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM and USER_DEFINED. The default value is UNIFORM.

buckleCase
A SymbolicConstant specifying how the boundary condition is defined in a **BUCKLE* analysis. Possible values are NOT_APPLICABLE, STRESS_PERTURBATION, BUCKLING_MODES, and PERTURBATION_AND_BUCKLING. The default value is NOT_APPLICABLE.

Return value

A ConnDisplacementBC object.

Exceptions

None.

`setValues(...)`

This method modifies the data for an existing ConnDisplacementBC object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConnDisplacementBC* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing ConnDisplacementBC object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the boundary condition is modified.

Optional arguments

u1 A Float, a Complex, or a SymbolicConstant specifying the displacement component in the connector's local 1-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

u2 A Float, a Complex, or a SymbolicConstant specifying the displacement component in the connector's local 2-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

u3 A Float, a Complex, or a SymbolicConstant specifying the displacement component in the connector's local 3-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

ur1 A Float, a Complex, or a SymbolicConstant specifying the rotational component in the connector's local 4-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

ur2 A Float, a Complex, or a SymbolicConstant specifying the rotational component in the connector's local 5-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

ur3 A Float, a Complex, or a SymbolicConstant specifying the rotational component in the connector's local 6-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the boundary condition is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

buckleCase A SymbolicConstant specifying how the boundary condition is defined in a **BUCKLE* analysis. Possible values are NOT_APPLICABLE, STRESS_PERTURBATION, BUCKLING_MODES, and PERTURBATION_AND_BUCKLING. The default value is NOT_APPLICABLE.

Return value
`None`.

Exceptions
None.

Members
The ConnDisplacementBC object can have the following members:

name
A String specifying the boundary condition repository key.

fixed
A Boolean specifying whether the boundary condition should remain fixed at the current values at the start of the step. The default value is OFF.

buckleCase
A SymbolicConstant specifying how the boundary condition is defined in a **BUCKLE* analysis. Possible values are NOT_APPLICABLE, STRESS_PERTURBATION, BUCKLING_MODES, and PERTURBATION_AND_BUCKLING. The default value is NOT_APPLICABLE.

distributionType
A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM and USER_DEFINED. The default value is UNIFORM.

fastenerName
A String specifying the name of the assembled fastener to which the boundary condition will be applied. This argument is not valid when *region* is specified. When this argument is specified, *fastenerSetName* must also be specified. The default value is an empty string.

fastenerSetName
A String specifying the assembled fastener template model set to which the boundary condition will be applied. This argument is not valid when *region* is specified. When this argument is specified, *fastenerName* must also be specified. The default value is an empty string.

category
A SymbolicConstant specifying the category of the boundary condition. Possible values are MECHANICAL and THERMAL.

region
A *Region* object specifying the region to which the boundary condition is applied.

localCsys
`None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

ConnDisplacementBCState object

The ConnDisplacementBCState object stores the propagating data for a connector displacement/rotation boundary condition in a step. One instance of this object is created internally by the *ConnDisplacementBC* object for each step. The instance is also deleted internally by the *ConnDisplacementBC* object.

The ConnDisplacementBCState object has no constructor or methods.

The ConnDisplacementBCState object is derived from the *BoundaryConditionState* object.

Access

```
import load
mdb.models[name].steps[name].boundaryConditionStates[name]
```

Members

The ConnDisplacementBCState object has the following members:

u1

A Float or a Complex specifying the displacement component in the connector's local 1-direction.

u2

A Float or a Complex specifying the displacement component in the connector's local 2-direction.

u3

A Float or a Complex specifying the displacement component in the connector's local 3-direction.

ur1

A Float or a Complex specifying the rotational component in the connector's local 4-direction.

ur2

A Float or a Complex specifying the rotational component in the connector's local 5-direction.

ur3

A Float or a Complex specifying the rotational component in the connector's local 6-direction.

u1State

A SymbolicConstant specifying the propagation state of the displacement component in the connector's local 1-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

u2State

A SymbolicConstant specifying the propagation state of the displacement component in the connector's local 2-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

u3State

A SymbolicConstant specifying the propagation state of the displacement component in the connector's local 3-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

ur1State

A SymbolicConstant specifying the propagation state of the rotational component in the connector's local 4-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

ur2State

A SymbolicConstant specifying the propagation state of the rotational component in the connector's local 5-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

ur3State

A SymbolicConstant specifying the propagation state of the rotational component in the connector's local 6-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

amplitudeState

A SymbolicConstant specifying the propagation state of the amplitude reference. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

status

A SymbolicConstant specifying the propagation state of the *BoundaryConditionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- PROPAGATED_FROM_BASE_STATE
- MODIFIED_FROM_BASE_STATE
- DEACTIVATED_FROM_BASE_STATE
- BUILT_INTO_MODES

amplitude

A String specifying the name of the amplitude reference. The String is empty if the boundary condition has no amplitude reference.

Corresponding analysis keywords

- **CONNECTOR MOTION*, TYPE=DISPLACEMENT (degree of freedom: 1, 2, 3, 4, 5, or 6)

ConnVelocityBC object

The ConnVelocityBC object stores the data for a connector velocity boundary condition.

The ConnVelocityBC object is derived from the *BoundaryCondition* object.

Access

```
import load
mdb.models[name].boundaryConditions[name]
```

ConnVelocityBC(...)

This method creates a ConnVelocityBC object on a wire region. Alternatively, the boundary condition may also be applied to a wire set referenced from an assembled fastener template model.

Path

```
mdb.models[name].ConnVelocityBC
```

Required arguments

name
A String specifying the boundary condition repository key.

createStepName
A String specifying the name of the step in which the boundary condition is created.

Optional arguments

region
The wire region to which the boundary condition is applied. This argument is not valid when *fastenerName* and *fastenerSetName* are specified.

fastenerName
A String specifying the name of the assembled fastener to which the boundary condition will be applied. This argument is not valid when *region* is specified. When this argument is specified, *fastenerSetName* must also be specified. The default value is an empty string.

fastenerSetName
A String specifying the assembled fastener template model set to which the boundary condition will be applied. This argument is not valid when *region* is specified. When this argument is specified, *fastenerName* must also be specified. The default value is an empty string.

v1
A Float or a SymbolicConstant specifying the velocity component in the connector's local 1-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

Note:

Although *v1*, *v2*, *v3*, *vr1*, *vr2*, and *vr3* are optional arguments, at least one of them must be specified.

v2
A Float or a SymbolicConstant specifying the velocity component in the connector's local 2-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

v3
A Float or a SymbolicConstant specifying the velocity component in the connector's local 3-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

vr1
A Float or a SymbolicConstant specifying the rotational velocity component in the connector's local 4-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

vr2
A Float or a SymbolicConstant specifying the rotational velocity component in the connector's local 5-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

vr3
A Float or a SymbolicConstant specifying the rotational velocity component in the connector's local 6-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

amplitude
A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the boundary condition has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

distributionType
A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM and USER_DEFINED. The default value is UNIFORM.

Return value

A ConnVelocityBC object.

Exceptions

None.

`setValues(...)`

This method modifies the data for an existing ConnVelocityBC object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConnVelocityBC* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing ConnVelocityBC object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the boundary condition is modified.

Optional arguments

v1 A Float or a SymbolicConstant specifying the velocity component in the connector's local 1-direction. Possible values for the SymbolicConstant are SET and FREED.

v2 A Float or a SymbolicConstant specifying the velocity component in the connector's local 2-direction. Possible values for the SymbolicConstant are SET and FREED.

v3 A Float or a SymbolicConstant specifying the velocity component in the connector's local 3-direction. Possible values for the SymbolicConstant are SET and FREED.

vr1 A Float or a SymbolicConstant specifying the rotational velocity component in the connector's local 4-direction. Possible values for the SymbolicConstant are SET and FREED.

vr2 A Float or a SymbolicConstant specifying the rotational velocity component in the connector's local 5-direction. Possible values for the SymbolicConstant are SET and FREED.

vr3 A Float or a SymbolicConstant specifying the rotational velocity component in the connector's local 6-direction. Possible values for the SymbolicConstant are SET and FREED.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the boundary condition is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The ConnVelocityBC object can have the following members:

name A String specifying the boundary condition repository key.

distributionType

A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM and USER_DEFINED. The default value is UNIFORM.

fastenerName

A String specifying the name of the assembled fastener to which the boundary condition will be applied. This argument is not valid when *region* is specified. When this argument is specified, *fastenerSetName* must also be specified. The default value is an empty string.

fastenerSetName

A String specifying the assembled fastener template model set to which the boundary condition will be applied. This argument is not valid when *region* is specified. When this argument is specified, *fastenerName* must also be specified. The default value is an empty string.

category

A SymbolicConstant specifying the category of the boundary condition. Possible values are MECHANICAL and THERMAL.

region

A *Region* object specifying the region to which the boundary condition is applied.

localCsys

`None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

ConnVelocityBCState object

The ConnVelocityBCState object stores the propagating data for a velocity boundary condition in a step. One instance of this object is created internally by the *ConnVelocityBC* object for each step. The instance is also deleted internally by the *ConnVelocityBC* object.

The ConnVelocityBCState object has no constructor or methods.

The ConnVelocityBCState object is derived from the *BoundaryConditionState* object.

Access

```
import load
mdb.models[name].steps[name].boundaryConditionStates[name]
```

Members

The ConnVelocityBCState object has the following members:

v1

A Float specifying the velocity component in the connector's local 1-direction.

v2

A Float specifying the velocity component in the connector's local 2-direction.

v3

A Float specifying the velocity component in the connector's local 3-direction.

vr1

A Float specifying the rotational velocity component in the connector's local 4-direction.

vr2

A Float specifying the rotational velocity component in the connector's local 5-direction.

vr3

A Float specifying the rotational velocity component in the connector's local 6-direction.

v1State

A SymbolicConstant specifying the propagation state of the velocity component in the connector's local 1-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

v2State

A SymbolicConstant specifying the propagation state of the velocity component in the connector's local 2-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

v3State

A SymbolicConstant specifying the propagation state of the velocity component in the connector's local 3-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

vr1State

A SymbolicConstant specifying the propagation state of the rotational velocity component in the connector's local 4–direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

vr2State

A SymbolicConstant specifying the propagation state of the rotational velocity component in the connector's local 5–direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

vr3State

A SymbolicConstant specifying the propagation state of the rotational velocity component in the connector's local 6–direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

amplitudeState

A SymbolicConstant specifying the propagation state of the amplitude reference. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

status

A SymbolicConstant specifying the propagation state of the *BoundaryConditionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- PROPAGATED_FROM_BASE_STATE
- MODIFIED_FROM_BASE_STATE
- DEACTIVATED_FROM_BASE_STATE
- BUILT_INTO_MODES

amplitude

A String specifying the name of the amplitude reference. The String is empty if the boundary condition has no amplitude reference.

Corresponding analysis keywords

- **CONNECTOR MOTION*, TYPE=VELOCITY (degree of freedom: 1, 2, 3, 4, 5, or 6)

DisplacementBaseMotionBC object

The DisplacementBaseMotionBC object stores the data for a displacement base motion boundary condition.

The DisplacementBaseMotionBC object is derived from the *BoundaryCondition* object.

Access

```
import load
mdb.models[name].boundaryConditions[name]
```

DisplacementBaseMotionBC(...)

This method creates a DisplacementBaseMotionBC object.

Path

```
mdb.models[name].DisplacementBaseMotionBC
```

Required arguments

name A String specifying the boundary condition repository key.

createStepName A String specifying the name of the step in which the boundary condition is created.

dof A SymbolicConstant specifying the constrained degree-of-freedom. Possible values for the SymbolicConstant are U1, U2, U3, UR1, UR2, UR3. The default value is U1.

Optional arguments

amplitudeScaleFactor A Float specifying the scale factor for the amplitude curve. The default value is 1.0.

centerOfRotation A *ModelDot* object specifying a tuple containing one center of rotation. The default value is the global origin. This argument applies only when *dof*=UR1, UR2, or UR3.

correlation A *CorrelationArray* object.

secondaryBase A String specifying the name of the *SecondaryBaseBC* object associated with this boundary condition. The default value is an empty string.

useComplex A Boolean specifying whether to define the imaginary (out-of-plane) portion of the base motion record given by amplitude definition. The default value is OFF.

amplitude A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the boundary condition has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

A DisplacementBaseMotionBC object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing DisplacementBaseMotionBC object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *DisplacementBaseMotionBC* method, except for the *name* and *createStepName* arguments.

Return value

```
None.
```

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing DisplacementBaseMotionBC object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the boundary condition is modified.

Optional arguments

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the boundary condition is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

```
None.
```

Exceptions

None.

Members

The DisplacementBaseMotionBC object can have the following members:

name

A String specifying the boundary condition repository key.

amplitudeScaleFactor

A Float specifying the scale factor for the amplitude curve. The default value is 1.0.

useComplex

A Boolean specifying whether to define the imaginary (out-of-plane) portion of the base motion record given by amplitude definition. The default value is OFF.

centerOfRotation

A *ModelDot* object specifying a tuple containing one center of rotation. The default value is the global origin. This argument applies only when *dof*=UR1, UR2, or UR3.

correlation

A *CorrelationArray* object.

secondaryBase

A String specifying the name of the *SecondaryBaseBC* object associated with this boundary condition. The default value is an empty string.

category

A SymbolicConstant specifying the category of the boundary condition. Possible values are MECHANICAL and THERMAL.

region

A *Region* object specifying the region to which the boundary condition is applied.

localCsys

`None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

DisplacementBaseMotionBCState object

The DisplacementBaseMotionBCState object stores the propagating data for a velocity base motion boundary condition in a step. One instance of this object is created internally by the *DisplacementBaseMotionBC* object for each step. The instance is also deleted internally by the *DisplacementBaseMotionBC* object.

The DisplacementBaseMotionBCState object has no constructor or methods.

amplitude

A String specifying the name of the amplitude reference. The String is empty if the boundary condition has no amplitude reference.

Corresponding analysis keywords

- **BASE MOTION*

DisplacementBC object

The DisplacementBC object stores the data for a displacement/rotation boundary condition.

The DisplacementBC object is derived from the *BoundaryCondition* object.

Access

```
import load
mdb.models[name].boundaryConditions[name]
```

DisplacementBC(...)

This method creates a DisplacementBC object.

Path

```
mdb.models[name].DisplacementBC
```

Required arguments

name
A String specifying the boundary condition repository key.

createStepName
A String specifying the name of the step in which the boundary condition is created.

region
A *Region* object specifying the region to which the boundary condition is applied.

Optional arguments

fieldName
A String specifying the name of the *AnalyticalField* or *DiscreteField* object associated with this boundary condition. The *fieldName* argument applies only when *distributionType*=FIELD or *distributionType*=DISCRETE_FIELD. The default value is an empty string.

u1
A Float, a Complex, or a SymbolicConstant specifying the displacement component in the 1-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

Note:

Although *u1*, *u2*, *u3*, *ur1*, *ur2*, and *ur3* are optional arguments, at least one of them must be specified.

u2
A Float, a Complex, or a SymbolicConstant specifying the displacement component in the 2-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

u3
A Float, a Complex, or a SymbolicConstant specifying the displacement component in the 3-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

ur1
A Float, a Complex, or a SymbolicConstant specifying the rotational displacement component about the 1-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

ur2
A Float, a Complex, or a SymbolicConstant specifying the rotational displacement component about the 2-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

ur3
A Float, a Complex, or a SymbolicConstant specifying the rotational displacement component about the 3-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

fixed
A Boolean specifying whether the boundary condition should remain fixed at the current values at the start of the step. The default value is OFF.

amplitude
A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the boundary condition has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

distributionType
A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM, USER_DEFINED, FIELD, and DISCRETE_FIELD. The default value is UNIFORM.

localCsys
`None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

buckleCase
A SymbolicConstant specifying how the boundary condition is defined in a **BUCKLE* analysis. Possible values are NOT_APPLICABLE, STRESS_PERTURBATION, BUCKLING_MODES, and PERTURBATION_AND_BUCKLING. The default value is NOT_APPLICABLE.

Return value

A DisplacementBC object.

Exceptions

None.

`setValues(...)`

This method modifies the data for an existing DisplacementBC object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *DisplacementBC* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing DisplacementBC object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the boundary condition is modified.

Optional arguments

u1 A Float, a Complex, or a SymbolicConstant specifying the displacement component in the 1-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

u2 A Float, a Complex, or a SymbolicConstant specifying the displacement component in the 2-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

u3 A Float, a Complex, or a SymbolicConstant specifying the displacement component in the 3-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

ur1 A Float, a Complex, or a SymbolicConstant specifying the rotational displacement component about the 1-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

ur2 A Float, a Complex, or a SymbolicConstant specifying the rotational displacement component about the 2-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

ur3 A Float, a Complex, or a SymbolicConstant specifying the rotational displacement component about the 3-direction. Possible values for the SymbolicConstant are SET, UNCHANGED, and FREED.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the boundary condition is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

buckleCase A SymbolicConstant specifying how the boundary condition is defined in a **BUCKLE* analysis. Possible values are NOT_APPLICABLE, STRESS_PERTURBATION, BUCKLING_MODES, and PERTURBATION_AND_BUCKLING. The default value is NOT_APPLICABLE.

Return value

`None.`

Exceptions

None.

Members

The DisplacementBC object can have the following members:

name

A String specifying the boundary condition repository key.

distributionType

A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM, USER_DEFINED, FIELD, and DISCRETE_FIELD. The default value is UNIFORM.

fixed

A Boolean specifying whether the boundary condition should remain fixed at the current values at the start of the step. The default value is OFF.

buckleCase

A SymbolicConstant specifying how the boundary condition is defined in a **BUCKLE* analysis. Possible values are NOT_APPLICABLE, STRESS_PERTURBATION, BUCKLING_MODES, and PERTURBATION_AND_BUCKLING. The default value is NOT_APPLICABLE.

fieldName

A String specifying the name of the *AnalyticalField* or *DiscreteField* object associated with this boundary condition. The *fieldName* argument applies only when *distributionType*=FIELD or *distributionType*=DISCRETE_FIELD. The default value is an empty string.

category

A SymbolicConstant specifying the category of the boundary condition. Possible values are MECHANICAL and THERMAL.

region

A *Region* object specifying the region to which the boundary condition is applied.

localCsys

`None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

DisplacementBCState object

The DisplacementBCState object stores the propagating data for a displacement/rotation boundary condition in a step. One instance of this object is created internally by the *DisplacementBC* object for each step. The instance is also deleted internally by the *DisplacementBC* object.

The DisplacementBCState object has no constructor or methods.

The DisplacementBCState object is derived from the *BoundaryConditionState* object.

ur1

A Float or a Complex specifying the rotational displacement component about the 1-direction.

ur2

A Float or a Complex specifying the rotational displacement component about the 2-direction.

ur3

A Float or a Complex specifying the rotational displacement component about the 3-direction.

u1State

A SymbolicConstant specifying the propagation state of the displacement component in the 1-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

u2State

A SymbolicConstant specifying the propagation state of the displacement component in the 2-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

u3State

A SymbolicConstant specifying the propagation state of the displacement component in the 3-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

ur1State

A SymbolicConstant specifying the propagation state of the rotational displacement component about the 1-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

ur2State

A SymbolicConstant specifying the propagation state of the rotational displacement component about the 2-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

ur3State

A SymbolicConstant specifying the propagation state of the rotational displacement component about the 3-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

amplitudeState A SymbolicConstant specifying the propagation state of the amplitude reference. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

status A SymbolicConstant specifying the propagation state of the *BoundaryConditionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- PROPAGATED_FROM_BASE_STATE
- MODIFIED_FROM_BASE_STATE
- DEACTIVATED_FROM_BASE_STATE
- BUILT_INTO_MODES

amplitude A String specifying the name of the amplitude reference. The String is empty if the boundary condition has no amplitude reference.

Corresponding analysis keywords

- **BOUNDARY*, TYPE=DISPLACEMENT (degree of freedom: 1, 2, 3, 4, 5, or 6)

ElectricPotentialBC object

The ElectricPotentialBC object stores the data for an electrical potential boundary condition.

The ElectricPotentialBC object is derived from the *BoundaryCondition* object.

Access

```
import load
mdb.models[name].boundaryConditions[name]
```

ElectricPotentialBC(...)

This method creates an ElectricPotentialBC object.

Path

```
mdb.models[name].ElectricPotentialBC
```

Required arguments

name	A String specifying the boundary condition repository key.
createStepName	A String specifying the name of the step in which the boundary condition is created.
region	A *Region* object specifying the region to which the boundary condition is applied.

Optional arguments

fieldName	A String specifying the name of the *AnalyticalField* object associated with this boundary condition. The *fieldName* argument applies only when *distributionType*=FIELD. The default value is an empty string.
magnitude	A Float specifying the electrical potential magnitude. The default value is 0. The *magnitude* argument is optional if *distributionType*=USER_DEFINED.
distributionType	A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.
amplitude	A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the boundary condition has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.
fixed	A Boolean specifying whether the boundary condition should remain fixed at the current values at the start of the step. The default value is OFF.

Return value

An ElectricPotentialBC object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing ElectricPotentialBC object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ElectricPotentialBC* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing ElectricPotentialBC object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the boundary condition is modified.

Optional arguments

magnitude A Float or the SymbolicConstant FREED specifying the electrical potential magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the boundary condition is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The ElectricPotentialBC object can have the following members:

name

A String specifying the boundary condition repository key.

distributionType

A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

fieldName

A String specifying the name of the *AnalyticalField* object associated with this boundary condition. The *fieldName* argument applies only when *distributionType*=FIELD. The default value is an empty string.

category

A SymbolicConstant specifying the category of the boundary condition. Possible values are MECHANICAL and THERMAL.

region

A *Region* object specifying the region to which the boundary condition is applied.

localCsys

`None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

ElectricPotentialBCState object

The ElectricPotentialBCState object stores the propagating data for a electrical potential boundary condition in a step. One instance of this object is created internally by the *ElectricPotentialBC* object for each step. The instance is also deleted internally by the *ElectricPotentialBC* object.

The ElectricPotentialBCState object has no constructor or methods.

The ElectricPotentialBCState object is derived from the *BoundaryConditionState* object.

Access

```
import load
mdb.models[name].steps[name].boundaryConditionStates[name]
```

Members

The ElectricPotentialBCState object has the following members:

magnitude

A Float specifying the electrical potential magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the electrical potential magnitude. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

amplitudeState

A SymbolicConstant specifying the propagation state of the amplitude reference. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

status

A SymbolicConstant specifying the propagation state of the *BoundaryConditionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- PROPAGATED_FROM_BASE_STATE
- MODIFIED_FROM_BASE_STATE
- DEACTIVATED_FROM_BASE_STATE
- BUILT_INTO_MODES

amplitude

A String specifying the name of the amplitude reference. The String is empty if the boundary condition has no amplitude reference.

Corresponding analysis keywords

- **BOUNDARY* (degree of freedom: 9)

ElectricPotentialElectrolyteBC object

The ElectricPotentialElectrolyteBC object stores the data for an electrical potential in electrolyte boundary condition.

The ElectricPotentialElectrolyteBC object is derived from the *BoundaryCondition* object.

Access

```
import load
mdb.models[name].boundaryConditions[name]
```

ElectricPotentialElectrolyteBC(...)

This method creates an ElectricPotentialElectrolyteBC object.

Path

```
mdb.models[name].ElectricPotentialElectrolyteBC
```

Required arguments

name A String specifying the boundary condition repository key.

createStepName A String specifying the name of the step in which the boundary condition is created.

region A *Region* object specifying the region to which the boundary condition is applied.

Optional arguments

fieldName A String specifying the name of the *AnalyticalField* object associated with this boundary condition. The *fieldName* argument applies only when *distributionType*=FIELD. The default value is an empty string.

magnitude A Float specifying the magnitude of the electrical potential of the electrolyte. The default value is 0. The *magnitude* argument is optional if *distributionType*=USER_DEFINED.

distributionType A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

amplitude A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the boundary condition has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

fixed A Boolean specifying whether the boundary condition should remain fixed at the current values at the start of the step. The default value is OFF.

Return value

An ElectricPotentialElectrolyteBC object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing ElectricPotentialElectrolyteBC object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ElectricPotentialElectrolyteBC* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing ElectricPotentialElectrolyteBC object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the boundary condition is modified.

Optional arguments

magnitude A Float or the SymbolicConstant FREED specifying the electrical potential magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the boundary condition is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The ElectricPotentialElectrolyteBC object can have the following members:

name

A String specifying the boundary condition repository key.

distributionType

A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

fieldName

A String specifying the name of the *AnalyticalField* object associated with this boundary condition. The *fieldName* argument applies only when *distributionType*=FIELD. The default value is an empty string.

category

A SymbolicConstant specifying the category of the boundary condition. Possible values are MECHANICAL, ELECTROCHEMICAL, and THERMAL.

region

A *Region* object specifying the region to which the boundary condition is applied.

localCsys

`None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

ElectricPotentialElectrolyteBCState object

The ElectricPotentialElectrolyteBCState object stores the propagating data for an electrical potential of electrolyte boundary condition in a step.
One instance of this object is created internally by the *ElectricPotentialElectrolyteBC* object for each step. The instance is also deleted internally by the *ElectricPotentialElectrolyteBC* object.

The ElectricPotentialElectrolyteBCState object has no constructor or methods.

The ElectricPotentialElectrolyteBCState object is derived from the *BoundaryConditionState* object.

Access

```
import load
mdb.models[name].steps[name].boundaryConditionStates[name]
```

Members

The ElectricPotentialElectrolyteBCState object has the following members:

magnitude

A Float specifying the electrical potential of electrolyte magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the electrical potential of electrolyte magnitude. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

amplitudeState

A SymbolicConstant specifying the propagation state of the amplitude reference. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

status

A SymbolicConstant specifying the propagation state of the *BoundaryConditionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- PROPAGATED_FROM_BASE_STATE
- MODIFIED_FROM_BASE_STATE
- DEACTIVATED_FROM_BASE_STATE
- BUILT_INTO_MODES

amplitude

A String specifying the name of the amplitude reference. The String is empty if the boundary condition has no amplitude reference.

Corresponding analysis keywords

- **BOUNDARY* (degree of freedom: 9)

EulerianBC object

The EulerianBC object stores the data for an Eulerian boundary condition.

The EulerianBC object is derived from the *BoundaryCondition* object.

Access

```
import load
mdb.models[name].boundaryConditions[name]
```

EulerianBC(...)

This method creates a EulerianBC object.

Path

```
mdb.models[name].EulerianBC
```

Required arguments

name	A String specifying the boundary condition repository key.
createStepName	A String specifying the name of the step in which the boundary condition is created.
region	A *Region* object specifying the region to which the boundary condition is applied.

Optional arguments

definition	A SymbolicConstant specifying the flow conditions to be defined. Possible values are INFLOW, OUTFLOW, and BOTH. The default value is INFLOW.
inflowType	A SymbolicConstant specifying the control of material flow into the Eulerian domain. Possible values are FREE, NONE, and VOID. The default value is FREE.
outflowType	A SymbolicConstant specifying the control of flow of material out of the Eulerian domain. Possible values are ZERO_PRESSURE, FREE, NON_REFLECTING, and EQUILIBRIUM. The default value is ZERO_PRESSURE.

Return value

An EulerianBC object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing EulerianBC object in the step where it is created.

Required arguments

None.

Optional arguments

region A *Region* object specifying the region to which the boundary condition is applied.

definition A SymbolicConstant specifying the material flow conditions to be defined. Possible values are INFLOW, OUTFLOW, and BOTH. The default value is INFLOW.

inflowType A SymbolicConstant specifying the control of material flow into the Eulerian domain. Possible values are FREE, NONE, and VOID. The default value is FREE.

outflowType A SymbolicConstant specifying the control of material flow out of the Eulerian domain. Possible values are ZERO_PRESSURE, FREE, NON_REFLECTING, and EQUILIBRIUM. The default value is ZERO_PRESSURE.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing EulerianBC object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the boundary condition is modified.

Optional arguments

definition A SymbolicConstant specifying the material flow conditions to be defined. Possible values are INFLOW, OUTFLOW, and BOTH. The default value is INFLOW.

inflowType A SymbolicConstant specifying the control of material flow into the Eulerian domain. Possible values are FREE, NONE, and VOID. The default value is FREE.

outflowType A SymbolicConstant specifying the control of material flow out of the Eulerian domain. Possible values are ZERO_PRESSURE, FREE, NON_REFLECTING, and EQUILIBRIUM. The default value is ZERO_PRESSURE.

Return value

`None.`

Exceptions

None.

Members

The EulerianBC object can have the following members:

name
A String specifying the boundary condition repository key.

definition
A SymbolicConstant specifying the flow conditions to be defined. Possible values are INFLOW, OUTFLOW, and BOTH. The default value is INFLOW.

inflowType
A SymbolicConstant specifying the control of material flow into the Eulerian domain. Possible values are FREE, NONE, and VOID. The default value is FREE.

outflowType
A SymbolicConstant specifying the control of flow of material out of the Eulerian domain. Possible values are ZERO_PRESSURE, FREE, NON_REFLECTING, and EQUILIBRIUM. The default value is ZERO_PRESSURE.

category
A SymbolicConstant specifying the category of the boundary condition. Possible values are MECHANICAL and THERMAL.

region
A *Region* object specifying the region to which the boundary condition is applied.

localCsys
`None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

EulerianBCState object

The EulerianBCState object stores the propagating data for an Eulerian boundary condition in a step. One instance of this object is created internally by the *EulerianBC* object for each step. The instance is also deleted internally by the *EulerianBC* object.

The EulerianBCState object has no constructor or methods.

The EulerianBCState object is derived from the *BoundaryConditionState* object.

Access

```
import load
mdb.models[name].steps[name].boundaryConditionStates[name]
```

Members

The EulerianBCState object has the following members:

definition

A SymbolicConstant specifying the material flow conditions to be defined. Possible values are INFLOW, OUTFLOW, and BOTH. The default value is INFLOW.

definitionState

A SymbolicConstant specifying the propagation state of the definition member. Possible values are UNSET, SET, and UNCHANGED.

inflowType

A SymbolicConstant specifying the material flow conditions to be defined. Possible values are FREE, NONE, and VOID. The default value is FREE.

inflowTypeState

A SymbolicConstant specifying the propagation state of the definition member. Possible values are UNSET, SET, and UNCHANGED.

outflowType

A SymbolicConstant specifying the material flow conditions to be defined. Possible values are ZERO_PRESSURE, FREE, NON_REFLECTING, and EQUILIBRIUM. The default value is ZERO_PRESSURE.

outflowTypeState

A SymbolicConstant specifying the propagation state of the definition member. Possible values are UNSET, SET, and UNCHANGED.

amplitudeState

A SymbolicConstant specifying the propagation state of the amplitude reference. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

status

A SymbolicConstant specifying the propagation state of the *BoundaryConditionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE

- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- PROPAGATED_FROM_BASE_STATE
- MODIFIED_FROM_BASE_STATE
- DEACTIVATED_FROM_BASE_STATE
- BUILT_INTO_MODES

amplitude

A String specifying the name of the amplitude reference. The String is empty if the boundary condition has no amplitude reference.

Corresponding analysis keywords

- **EULERIAN BOUNDARY*

EulerianMotionBC object

The EulerianMotionBC object stores the data for an Eulerian mesh motion boundary condition.

The EulerianMotionBC object is derived from the *BoundaryCondition* object.

Access

```
import load
mdb.models[name].boundaryConditions[name]
```

EulerianMotionBC(...)

This method creates an EulerianMotionBC object.

Path

```
mdb.models[name].EulerianMotionBC
```

Required arguments

name	A String specifying the boundary condition repository key.
createStepName	A String specifying the name of the step in which the boundary condition is created.
instanceName	A String specifying the name of the Eulerian part instance.

Optional arguments

followRegion	A Boolean specifying whether the mesh will follow a regular surface region or an Eulerian surface. The default value is ON.
region	A *Region* object specifying the region to which the boundary condition is applied.
materialName	A String specifying the name of the Eulerian surface to follow. This argument applies only when *followRegion*=False.
ctrPosition1	A SymbolicConstant specifying the 1-direction translational constraint on the center of the Eulerian mesh. Possible values are FREE and FIXED. The default value is FREE.
posPosition1	A SymbolicConstant specifying the translational constraint on the positive (maximum) bounds of the mesh in the 1 direction. Possible values are FREE and FIXED. The default value is FREE.
negPosition1	A SymbolicConstant specifying the translational constraint on the negative (minimum) bounds of the mesh in the 1 direction. Possible values are FREE and FIXED. The default value is FREE.

expansionRatio1

`None` or a Float specifying the upper bounds on the allowable scaling of the mesh in the 1 direction. If *expansionRatio1*=`None`, then there is no upper limit. The default value is `None`.

contractRatio1

A Float specifying the lower bounds on the allowable scaling of the mesh in the 1 direction. The default value is 0.0.

ctrPosition2

A SymbolicConstant specifying the 2-direction translational constraint on the center of the Eulerian mesh. Possible values are FREE and FIXED. The default value is FREE.

posPosition2

A SymbolicConstant specifying the translational constraint on the positive (maximum) bounds of the mesh in the 2 direction. Possible values are FREE and FIXED. The default value is FREE.

negPosition2

A SymbolicConstant specifying the translational constraint on the negative (minimum) bounds of the mesh in the 2 direction. Possible values are FREE and FIXED. The default value is FREE.

expansionRatio2

`None` or a Float specifying the upper bounds on the allowable scaling of the mesh in the 2 direction. If *expansionRatio2*=`None`, then there is no upper limit. The default value is `None`.

contractRatio2

A Float specifying the lower bounds on the allowable scaling of the mesh in the 2 direction. The default value is 0.0.

ctrPosition3

A SymbolicConstant specifying the 3-direction translational constraint on the center of the Eulerian mesh. Possible values are FREE and FIXED. The default value is FREE.

posPosition3

A SymbolicConstant specifying the translational constraint on the positive (maximum) bounds of the mesh in the 3 direction. Possible values are FREE and FIXED. The default value is FREE.

negPosition3

A SymbolicConstant specifying the translational constraint on the negative (minimum) bounds of the mesh in the 3 direction. Possible values are FREE and FIXED. The default value is FREE.

expansionRatio3

`None` or a Float specifying the upper bounds on the allowable scaling of the mesh in the 3 direction. If *expansionRatio3*=`None`, then there is no upper limit. The default value is `None`.

contractRatio3

A Float specifying the lower bounds on the allowable scaling of the mesh in the 3 direction. The default value is 0.0.

allowContraction

A Boolean specifying whether the mesh is allowed to contract . The default value is ON.

aspectLimit

A Float specifying the maximum change in allowed aspect ratio (for any of the three mesh aspects, 1-2, 2-3, 3-1). The default value is 10.0.

vmaxFactor A Float specifying the multiplier for the mesh nodal velocity limit. The default value is 1.01.

volThreshold A Float specifying the lower bounds on the volume fraction when determining which nodes to include in the surface bounding box calculation for an Eulerian material surface. This argument applies only when *followRegion*=False. The default value is 0.5.

bufferSize `None` or a Float specifying the buffer between the surface box and the Eulerian section mesh bounding box. The default value is 2.0.

Return value

An EulerianMotionBC object.

Exceptions

None.

`setValues(...)`

This method modifies the data for an existing EulerianMotionBC object in the step where it is created.

Required arguments

None.

Optional arguments

instanceName A String specifying the name of the Eulerian part instance.

followRegion A Boolean specifying whether the mesh will follow a regular surface region or an Eulerian surface. The default value is ON.

region A *Region* object specifying the region to which the boundary condition is applied.

materialName A String specifying the name of the Eulerian surface to follow. This argument applies only when *followRegion*=False.

ctrPosition1 A SymbolicConstant specifying the 1-direction translational constraint on the center of the Eulerian mesh. Possible values are FREE and FIXED. The default value is FREE.

posPosition1 A SymbolicConstant specifying the translational constraint on the positive (maximum) bounds of the mesh in the 1 direction. Possible values are FREE and FIXED. The default value is FREE.

negPosition1 A SymbolicConstant specifying the translational constraint on the negative (minimum) bounds of the mesh in the 1 direction. Possible values are FREE and FIXED. The default value is FREE.

expansionRatio1

`None` or a Float specifying the upper bounds on the allowable scaling of the mesh in the 1 direction. If *expansionRatio1*=`None`, then there is no upper limit. The default value is `None`.

contractRatio1

A Float specifying the lower bounds on the allowable scaling of the mesh in the 1 direction. The default value is 0.0.

ctrPosition2

A SymbolicConstant specifying the 2-direction translational constraint on the center of the Eulerian mesh. Possible values are FREE and FIXED. The default value is FREE.

posPosition2

A SymbolicConstant specifying the translational constraint on the positive (maximum) bounds of the mesh in the 2 direction. Possible values are FREE and FIXED. The default value is FREE.

negPosition2

A SymbolicConstant specifying the translational constraint on the negative (minimum) bounds of the mesh in the 2 direction. Possible values are FREE and FIXED. The default value is FREE.

expansionRatio2

`None` or a Float specifying the upper bounds on the allowable scaling of the mesh in the 2 direction. If *expansionRatio2*=`None`, then there is no upper limit. The default value is `None`.

contractRatio2

A Float specifying the lower bounds on the allowable scaling of the mesh in the 2 direction. The default value is 0.0.

ctrPosition3

A SymbolicConstant specifying the 3-direction translational constraint on the center of the Eulerian mesh. Possible values are FREE and FIXED. The default value is FREE.

posPosition3

A SymbolicConstant specifying the translational constraint on the positive (maximum) bounds of the mesh in the 3 direction. Possible values are FREE and FIXED. The default value is FREE.

negPosition3

A SymbolicConstant specifying the translational constraint on the negative (minimum) bounds of the mesh in the 3 direction. Possible values are FREE and FIXED. The default value is FREE.

expansionRatio3

`None` or a Float specifying the upper bounds on the allowable scaling of the mesh in the 3 direction. If *expansionRatio3*=`None`, then there is no upper limit. The default value is `None`.

contractRatio3

A Float specifying the lower bounds on the allowable scaling of the mesh in the 3 direction. The default value is 0.0.

allowContraction

A Boolean specifying whether the mesh is allowed to contract . The default value is ON.

aspectLimit

A Float specifying the maximum change in allowed aspect ratio (for any of the three mesh aspects, 1-2, 2-3, 3-1). The default value is 10.0.

vmaxFactor
A Float specifying the multiplier for the mesh nodal velocity limit. The default value is 1.01.

volThreshold
A Float specifying the lower bounds on the volume fraction when determining which nodes to include in the surface bounding box calculation for an Eulerian material surface. This argument applies only when *followRegion*=False. The default value is 0.5.

bufferSize
`None` or a Float specifying the buffer between the surface box and the Eulerian section mesh bounding box. The default value is 2.0.

Return value
`None`.

Exceptions
None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing EulerianMotionBC object in the specified step.

Required arguments

stepName
A String specifying the name of the step in which the boundary condition is modified.

Optional arguments

ctrPosition1
A SymbolicConstant specifying the 1-direction translational constraint on the center of the Eulerian mesh. Possible values are FREE and FIXED. The default value is FREE.

posPosition1
A SymbolicConstant specifying the translational constraint on the positive (maximum) bounds of the mesh in the 1 direction. Possible values are FREE and FIXED. The default value is FREE.

negPosition1
A SymbolicConstant specifying the translational constraint on the negative (minimum) bounds of the mesh in the 1 direction. Possible values are FREE and FIXED. The default value is FREE.

expansionRatio1
`None` or a Float specifying the upper bounds on the allowable scaling of the mesh in the 1 direction. If *expansionRatio1*=`None`, then there is no upper limit. The default value is `None`.

contractRatio1
A Float specifying the lower bounds on the allowable scaling of the mesh in the 1 direction. The default value is 0.0.

ctrPosition2
A SymbolicConstant specifying the 2-direction translational constraint on the center of the Eulerian mesh. Possible values are FREE and FIXED. The default value is FREE.

posPosition2

A SymbolicConstant specifying the translational constraint on the positive (maximum) bounds of the mesh in the 2 direction. Possible values are FREE and FIXED. The default value is FREE.

negPosition2

A SymbolicConstant specifying the translational constraint on the negative (minimum) bounds of the mesh in the 2 direction. Possible values are FREE and FIXED. The default value is FREE.

expansionRatio2

`None` or a Float specifying the upper bounds on the allowable scaling of the mesh in the 2 direction. If *expansionRatio2*=`None`, then there is no upper limit. The default value is `None`.

contractRatio2

A Float specifying the lower bounds on the allowable scaling of the mesh in the 2 direction. The default value is 0.0.

ctrPosition3

A SymbolicConstant specifying the 3-direction translational constraint on the center of the Eulerian mesh. Possible values are FREE and FIXED. The default value is FREE.

posPosition3

A SymbolicConstant specifying the translational constraint on the positive (maximum) bounds of the mesh in the 3 direction. Possible values are FREE and FIXED. The default value is FREE.

negPosition3

A SymbolicConstant specifying the translational constraint on the negative (minimum) bounds of the mesh in the 3 direction. Possible values are FREE and FIXED. The default value is FREE.

expansionRatio3

`None` or a Float specifying the upper bounds on the allowable scaling of the mesh in the 3 direction. If *expansionRatio3*=`None`, then there is no upper limit. The default value is `None`.

contractRatio3

A Float specifying the lower bounds on the allowable scaling of the mesh in the 3 direction. The default value is 0.0.

allowContraction

A Boolean specifying whether the mesh is allowed to contract . The default value is ON.

aspectLimit

A Float specifying the maximum change in allowed aspect ratio (for any of the three mesh aspects, 1-2, 2-3, 3-1). The default value is 10.0.

vmaxFactor

A Float specifying the multiplier for the mesh nodal velocity limit. The default value is 1.01.

volThreshold

A Float specifying the lower bounds on the volume fraction when determining which nodes to include in the surface bounding box calculation for an Eulerian material surface. This argument applies only when *followRegion*=False. The default value is 0.5.

bufferSize

`None` or a Float specifying the buffer between the surface box and the Eulerian section mesh bounding box. The default value is 2.0.

Return value
`None.`

Exceptions
None.

Members
The EulerianMotionBC object can have the following members:

name
A String specifying the boundary condition repository key.

followRegion
A Boolean specifying whether the mesh will follow a regular surface region or an Eulerian surface. The default value is ON.

ctrPosition1
A SymbolicConstant specifying the 1-direction translational constraint on the center of the Eulerian mesh. Possible values are FREE and FIXED. The default value is FREE.

posPosition1
A SymbolicConstant specifying the translational constraint on the positive (maximum) bounds of the mesh in the 1 direction. Possible values are FREE and FIXED. The default value is FREE.

posPosition2
A SymbolicConstant specifying the translational constraint on the positive (maximum) bounds of the mesh in the 2 direction. Possible values are FREE and FIXED. The default value is FREE.

posPosition3
A SymbolicConstant specifying the translational constraint on the positive (maximum) bounds of the mesh in the 3 direction. Possible values are FREE and FIXED. The default value is FREE.

negPosition1
A SymbolicConstant specifying the translational constraint on the negative (minimum) bounds of the mesh in the 1 direction. Possible values are FREE and FIXED. The default value is FREE.

negPosition2
A SymbolicConstant specifying the translational constraint on the negative (minimum) bounds of the mesh in the 2 direction. Possible values are FREE and FIXED. The default value is FREE.

negPosition3
A SymbolicConstant specifying the translational constraint on the negative (minimum) bounds of the mesh in the 3 direction. Possible values are FREE and FIXED. The default value is FREE.

expansionRatio1

`None` or a Float specifying the upper bounds on the allowable scaling of the mesh in the 1 direction. If *expansionRatio1*=`None`, then there is no upper limit. The default value is `None`.

expansionRatio2

`None` or a Float specifying the upper bounds on the allowable scaling of the mesh in the 2 direction. If *expansionRatio2*=`None`, then there is no upper limit. The default value is `None`.

expansionRatio3

`None` or a Float specifying the upper bounds on the allowable scaling of the mesh in the 3 direction. If *expansionRatio3*=`None`, then there is no upper limit. The default value is `None`.

contractRatio1

A Float specifying the lower bounds on the allowable scaling of the mesh in the 1 direction. The default value is 0.0.

contractRatio2

A Float specifying the lower bounds on the allowable scaling of the mesh in the 2 direction. The default value is 0.0.

contractRatio3

A Float specifying the lower bounds on the allowable scaling of the mesh in the 3 direction. The default value is 0.0.

allowContraction

A Boolean specifying whether the mesh is allowed to contract . The default value is ON.

aspectLimit

A Float specifying the maximum change in allowed aspect ratio (for any of the three mesh aspects, 1-2, 2-3, 3-1). The default value is 10.0.

vmaxFactor

A Float specifying the multiplier for the mesh nodal velocity limit. The default value is 1.01.

volThreshold

A Float specifying the lower bounds on the volume fraction when determining which nodes to include in the surface bounding box calculation for an Eulerian material surface. This argument applies only when *followRegion*=False. The default value is 0.5.

bufferSize

`None` or a Float specifying the buffer between the surface box and the Eulerian section mesh bounding box. The default value is 2.0.

instanceName

A String specifying the name of the Eulerian part instance.

materialName

A String specifying the name of the Eulerian surface to follow. This argument applies only when *followRegion*=False.

category

A SymbolicConstant specifying the category of the boundary condition. Possible values are MECHANICAL and THERMAL.

region

A *Region* object specifying the region to which the boundary condition is applied.

localCsys

`None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

EulerianMotionBCState object

The EulerianMotionBCState object stores the propagating data for an Eulerian mesh motion boundary condition in a step. One instance of this object is created internally by the *EulerianMotionBC* object for each step. The instance is also deleted internally by the *EulerianMotionBC* object.

The EulerianMotionBCState object has no constructor or methods.

The EulerianMotionBCState object is derived from the *BoundaryConditionState* object.

Access

```
import load
mdb.models[name].steps[name].boundaryConditionStates[name]
```

Members

The EulerianMotionBCState object has the following members:

ctrPosition1

A SymbolicConstant specifying the 1-direction translational constraint on the center of the Eulerian mesh. Possible values are FREE and FIXED. The default value is FREE.

ctrPosition2

A SymbolicConstant specifying the 2-direction translational constraint on the center of the Eulerian mesh. Possible values are FREE and FIXED. The default value is FREE.

ctrPosition3

A SymbolicConstant specifying the 3-direction translational constraint on the center of the Eulerian mesh. Possible values are FREE and FIXED. The default value is FREE.

posPosition1

A SymbolicConstant specifying the translational constraint on the positive (maximum) bounds of the mesh in the 1 direction. Possible values are FREE and FIXED. The default value is FREE.

posPosition2

A SymbolicConstant specifying the translational constraint on the positive (maximum) bounds of the mesh in the 2 direction. Possible values are FREE and FIXED. The default value is FREE.

posPosition3

A SymbolicConstant specifying the translational constraint on the positive (maximum) bounds of the mesh in the 3 direction. Possible values are FREE and FIXED. The default value is FREE.

negPosition1

A SymbolicConstant specifying the translational constraint on the negative (minimum) bounds of the mesh in the 1 direction. Possible values are FREE and FIXED. The default value is FREE.

negPosition2

A SymbolicConstant specifying the translational constraint on the negative (minimum) bounds of the mesh in the 2 direction. Possible values are FREE and FIXED. The default value is FREE.

negPosition3

A SymbolicConstant specifying the translational constraint on the negative (minimum) bounds of the mesh in the 3 direction. Possible values are FREE and FIXED. The default value is FREE.

expansionRatio1

`None` or a Float specifying the upper bounds on the allowable scaling of the mesh in the 1 direction. If *expansionRatio1*=`None`, then there is no upper limit. The default value is `None`.

expansionRatio2

`None` or a Float specifying the upper bounds on the allowable scaling of the mesh in the 2 direction. If *expansionRatio2*=`None`, then there is no upper limit. The default value is `None`.

expansionRatio3

`None` or a Float specifying the upper bounds on the allowable scaling of the mesh in the 3 direction. If *expansionRatio3*=`None`, then there is no upper limit. The default value is `None`.

contractRatio1

A Float specifying the lower bounds on the allowable scaling of the mesh in the 1 direction. The default value is 0.0.

contractRatio2

A Float specifying the lower bounds on the allowable scaling of the mesh in the 2 direction. The default value is 0.0.

contractRatio3

A Float specifying the lower bounds on the allowable scaling of the mesh in the 3 direction. The default value is 0.0.

allowContraction

A Boolean specifying whether the mesh is allowed to contract . The default value is ON.

aspectLimit

A Float specifying the maximum change in allowed aspect ratio (for any of the three mesh aspects, 1-2, 2-3, 3-1). The default value is 10.0.

vmaxFactor

A Float specifying the multiplier for the mesh nodal velocity limit. The default value is 1.01.

volThreshold

A Float specifying the lower bounds on the volume fraction when determining which nodes to include in the surface bounding box calculation for an Eulerian material surface. This argument applies only when *followRegion*=False. The default value is 0.5.

bufferSize

`None` or a Float specifying the buffer between the surface box and the Eulerian section mesh bounding box. The default value is 2.0.

amplitudeState

A SymbolicConstant specifying the propagation state of the amplitude reference. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

status

A SymbolicConstant specifying the propagation state of the *BoundaryConditionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE

- PROPAGATED_FROM_BASE_STATE
- MODIFIED_FROM_BASE_STATE
- DEACTIVATED_FROM_BASE_STATE
- BUILT_INTO_MODES

amplitude

A String specifying the name of the amplitude reference. The String is empty if the boundary condition has no amplitude reference.

Corresponding analysis keywords

- **EULERIAN MESH MOTION*

FluidCavityPressureBC object

The FluidCavityPressureBC object stores the data for a fluid cavity pressure boundary condition.

The FluidCavityPressureBC object is derived from the *BoundaryCondition* object.

Access

```
import load
mdb.models[name].boundaryConditions[name]
```

FluidCavityPressureBC(...)

This method creates a FluidCavityPressureBC object.

Path

```
mdb.models[name].FluidCavityPressureBC
```

Required arguments

name	A String specifying the boundary condition repository key.
createStepName	A String specifying the name of the step in which the boundary condition is created.
fluidCavity	A String specifying the name of a Fluid Cavity Interaction.

Optional arguments

magnitude	A Float specifying the fluid cavity pressure magnitude. The default value is 0.
amplitude	A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the boundary condition has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.
fixed	A Boolean specifying whether the boundary condition should remain fixed at the current values at the start of the step. The default value is OFF.

Return value

A FluidCavityPressureBC object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing FluidCavityPressureBC object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *FluidCavityPressureBC* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing FluidCavityPressureBC object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the boundary condition is modified.

Optional arguments

magnitude A Float or the SymbolicConstant FREED specifying the fluid cavity pressure magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the boundary condition is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The FluidCavityPressureBC object can have the following members:

name A String specifying the boundary condition repository key.

fluidCavity A String specifying the name of a Fluid Cavity Interaction.

category A SymbolicConstant specifying the category of the boundary condition. Possible values are MECHANICAL and THERMAL.

region

A *Region* object specifying the region to which the boundary condition is applied.

localCsys

`None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

FluidCavityPressureBCState object

The FluidCavityPressureBCState object stores the propagating data for a fluid cavity pressure boundary condition in a step. One instance of this object is created internally by the *FluidCavityPressureBC* object for each step. The instance is also deleted internally by the *FluidCavityPressureBC* object.

The FluidCavityPressureBCState object has no constructor or methods.

The FluidCavityPressureBCState object is derived from the *BoundaryConditionState* object.

Access

```
import load
mdb.models[name].steps[name].boundaryConditionStates[name]
```

Members

The FluidCavityPressureBCState object has the following members:

magnitude

A Float specifying the fluid cavity pressure magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the fluid cavity pressure magnitude. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

amplitudeState

A SymbolicConstant specifying the propagation state of the amplitude reference. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

status

A SymbolicConstant specifying the propagation state of the *BoundaryConditionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- PROPAGATED_FROM_BASE_STATE
- MODIFIED_FROM_BASE_STATE
- DEACTIVATED_FROM_BASE_STATE
- BUILT_INTO_MODES

amplitude

A String specifying the name of the amplitude reference. The String is empty if the boundary condition has no amplitude reference.

Corresponding analysis keywords

- **BOUNDARY* (degree of freedom: 8)

IonConcentrationBC object

The IonConcentrationBC object stores the data for an ion concentration boundary condition.

The IonConcentrationBC object is derived from the *BoundaryCondition* object.

Access

```
import load
mdb.models[name].boundaryConditions[name]
```

IonConcentrationBC(...)

This method creates an IonConcentrationBC object.

Path

```
mdb.models[name].IonConcentrationBC
```

Required arguments

name	A String specifying the repository key.
region	A *Region* object specifying the region to which the predefined field is applied.

Optional arguments

distributionType	A SymbolicConstant specifying how the predefined field varies spatially. Possible values are UNIFORM, FIELD, and DISCRETE_FIELD. The default value is UNIFORM.
field	A String specifying the name of the *AnalyticalField* or *DiscreteField* object associated with this predefined field. The field argument applies only when *distributionType*=FIELD or *distributionType*=DISCRETE_FIELD. The default value is an empty string.
value	A Float specifying the initial value of ion concentration.

Return value

An IonConcentrationBC object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing IonConcentrationBC object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *IonConcentrationBC* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing IonConcentrationBC object in the specified step.

Required arguments

name A String specifying the repository key.

region A Region object specifying the region to which the predefined field is applied.

Optional arguments

distributionType A SymbolicConstant specifying how the predefined field varies spatially. Possible values are UNIFORM, FIELD, and DISCRETE_FIELD. The default value is UNIFORM.

field A String specifying the name of the AnalyticalField or DiscreteField object associated with this predefined field. The field argument applies only when *distributionType* is FIELD or *distributionType* is DISCRETE_FIELD. The default value is an empty string.

value

value A Float specifying the initial value of ion concentration.

Return value

`None.`

Exceptions

None.

Members

The IonConcentrationBC object can have the following members:

name A String specifying the boundary condition repository key.

distributionType A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

fieldName

A String specifying the name of the *AnalyticalField* object associated with this boundary condition. The *fieldName* argument applies only when *distributionType*=FIELD. The default value is an empty string.

category

A SymbolicConstant specifying the category of the boundary condition. Possible values are MECHANICAL, ELECTROCHEMICAL, and THERMAL.

region

A *Region* object specifying the region to which the boundary condition is applied.

localCsys

`None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

IonConcentrationBCState object

The IonConcentrationBCState object stores the propagating data for an ion concentration boundary condition in a step. One instance of this object is created internally by the *IonConcentrationBC* object for each step. The instance is also deleted internally by the *IonConcentrationBC* object.

The IonConcentrationBCState object has no constructor or methods.

The IonConcentrationBCState object is derived from the *BoundaryConditionState* object.

Access

```
import load
mdb.models[name].steps[name].boundaryConditionStates[name]
```

Members

The IonConcentrationBCState object has the following members:

magnitude

A Float specifying the ion concentration magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the ion concentration magnitude. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

amplitudeState

A SymbolicConstant specifying the propagation state of the amplitude reference. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

status

A SymbolicConstant specifying the propagation state of the *BoundaryConditionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- PROPAGATED_FROM_BASE_STATE
- MODIFIED_FROM_BASE_STATE
- DEACTIVATED_FROM_BASE_STATE
- BUILT_INTO_MODES

amplitude

A String specifying the name of the amplitude reference. The String is empty if the boundary condition has no amplitude reference.

Corresponding analysis keywords

- **BOUNDARY* (degree of freedom: 9)

MagneticVectorPotentialBC object

The MagneticVectorPotentialBC object stores the data for a magnetic vector potential boundary condition.

The MagneticVectorPotentialBC object is derived from the *BoundaryCondition* object.

Access

```
import load
mdb.models[name].boundaryConditions[name]
```

MagneticVectorPotentialBC(...)

This method creates a MagneticVectorPotentialBC object.

Path

```
mdb.models[name].MagneticVectorPotentialBC
```

Required arguments

name A String specifying the boundary condition repository key.

createStepName A String specifying the name of the step in which the boundary condition is created.

region A *Region* object specifying the region to which the boundary condition is applied.

Optional arguments

component1 A Complex, or a SymbolicConstant specifying the magnetic vector potential component in the 1-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET

component2 A Complex, or a SymbolicConstant specifying the magnetic vector potential component in the 2-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

component3 A Complex, or a SymbolicConstant specifying the magnetic vector potential component in the 3-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

amplitude A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the boundary condition has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

distributionType A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM and USER_DEFINED. The default value is UNIFORM.

localCsys `None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

Return value

A MagneticVectorPotentialBC object.

Exceptions

None.

`setValues(...)`

This method modifies the data for an existing MagneticVectorPotentialBC object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *MagneticVectorPotentialBC* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing MagneticVectorPotentialBC object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the boundary condition is modified.

Optional arguments

component1 A Complex, or a SymbolicConstant specifying the magnetic vector potential component in the 1-direction. Possible values for the SymbolicConstant are SET and UNCHANGED.

component2 A Complex, or a SymbolicConstant specifying the magnetic vector potential component in the 2-direction. Possible values for the SymbolicConstant are SET and UNCHANGED.

component3 A Complex, or a SymbolicConstant specifying the magnetic vector potential component in the 3-direction. Possible values for the SymbolicConstant areSET and UNCHANGED.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the boundary condition is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None`.

Exceptions

None.

Members

The MagneticVectorPotentialBC object can have the following members:

name A String specifying the boundary condition repository key.

distributionType A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM and USER_DEFINED. The default value is UNIFORM.

category A SymbolicConstant specifying the category of the boundary condition. Possible values are MECHANICAL and THERMAL.

region A *Region* object specifying the region to which the boundary condition is applied.

localCsys `None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

MaterialFlowBC object

The MaterialFlowBC object stores the data for a connector material flow boundary condition.

The MaterialFlowBC object is derived from the *BoundaryCondition* object.

Access

```
import load
mdb.models[name].boundaryConditions[name]
```

MaterialFlowBC(...)

This method creates a MaterialFlowBC object.

Path

```
mdb.models[name].MaterialFlowBC
```

Required arguments

name A String specifying the boundary condition repository key.

createStepName A String specifying the name of the step in which the boundary condition is created.

region A *Region* object specifying the region to which the boundary condition is applied.

Optional arguments

fieldName A String specifying the name of the *AnalyticalField* object associated with this boundary condition. The *fieldName* argument applies only when *distributionType*=FIELD. The default value is an empty string.

magnitude A Float specifying the material flow magnitude. The default value is 0. The *magnitude* argument is optional if *distributionType*=USER_DEFINED.

distributionType A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

amplitude A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the boundary condition has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

fixed A Boolean specifying whether the boundary condition should remain fixed at the current values at the start of the step. The default value is OFF.

Return value

A MaterialFlowBC object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing MaterialFlowBC object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *MaterialFlowBC* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing MaterialFlowBC object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the boundary condition is modified.

Optional arguments

magnitude A Float or the SymbolicConstant FREED specifying the material flow magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the boundary condition is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The MaterialFlowBC object can have the following members:

name

A String specifying the boundary condition repository key.

distributionType

A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

fieldName

A String specifying the name of the *AnalyticalField* object associated with this boundary condition. The *fieldName* argument applies only when *distributionType*=FIELD. The default value is an empty string.

category

A SymbolicConstant specifying the category of the boundary condition. Possible values are MECHANICAL and THERMAL.

region

A *Region* object specifying the region to which the boundary condition is applied.

localCsys

`None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

MaterialFlowBCState object

The MaterialFlowBCState object stores the propagating data for a connector material flow boundary condition in a step. One instance of this object is created internally by the *MaterialFlowBC* object for each step. The instance is also deleted internally by the *MaterialFlowBC* object.

The MaterialFlowBCState object has no constructor or methods.

The MaterialFlowBCState object is derived from the *BoundaryConditionState* object.

Access

import load
mdb.models[name].steps[name].boundaryConditionStates[name]
```

Members

The MaterialFlowBCState object has the following members:

magnitude

A Float specifying the material flow magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the material flow magnitude. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

amplitudeState

A SymbolicConstant specifying the propagation state of the amplitude reference. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

status

A SymbolicConstant specifying the propagation state of the *BoundaryConditionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- PROPAGATED_FROM_BASE_STATE
- MODIFIED_FROM_BASE_STATE
- DEACTIVATED_FROM_BASE_STATE
- BUILT_INTO_MODES

amplitude

A String specifying the name of the amplitude reference. The String is empty if the boundary condition has no amplitude reference.

Corresponding analysis keywords

Required arguments

name A String specifying the boundary condition repository key.

createStepName A String specifying the name of the step in which the boundary condition is created.

region A *Region* object specifying the region to which the boundary condition is applied.

Optional arguments

fieldName A String specifying the name of the *AnalyticalField* object associated with this boundary condition. The *fieldName* argument applies only when *distributionType*=FIELD. The default value is an empty string.

magnitude A Float specifying the pore pressure magnitude. The default value is 0. The *magnitude* argument is optional if *distributionType*=USER_DEFINED.

distributionType A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

amplitude A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the boundary condition has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

fixed A Boolean specifying whether the boundary condition should remain fixed at the current values at the start of the step. The default value is OFF.

Return value

A PorePressureBC object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing PorePressureBC object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *PorePressureBC* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing PorePressureBC object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the boundary condition is modified.

Optional arguments

magnitude A Float or the SymbolicConstant FREED specifying the pore pressure magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the boundary condition is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The PorePressureBC object can have the following members:

name

A String specifying the boundary condition repository key.

distributionType

A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

fieldName

A String specifying the name of the *AnalyticalField* object associated with this boundary condition. The *fieldName* argument applies only when *distributionType*=FIELD. The default value is an empty string.

category

A SymbolicConstant specifying the category of the boundary condition. Possible values are MECHANICAL and THERMAL.

region

A *Region* object specifying the region to which the boundary condition is applied.

localCsys

`None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

PorePressureBCState object

The PorePressureBCState object stores the propagating data for a pore pressure boundary condition in a step. One instance of this object is created internally by the *PorePressureBC* object for each step. The instance is also deleted internally by the *PorePressureBC* object.

The PorePressureBCState object has no constructor or methods.

RetainedNodalDofsBC object

The RetainedNodalDofsBC object stores the data for a retained nodal dofs boundary condition.

The RetainedNodalDofsBC object is derived from the *BoundaryCondition* object.

Access

```
import load
mdb.models[name].boundaryConditions[name]
```

RetainedNodalDofsBC(...)

This method creates a RetainedNodalDofsBC object.

Path

```
mdb.models[name].RetainedNodalDofsBC
```

Required arguments

name A String specifying the boundary condition repository key.

createStepName A String specifying the name of the step in which the boundary condition is created.

region A *Region* object specifying the region to which the boundary condition is applied.

Optional arguments

u1 A Boolean specifying whether to retain the degree of freedom in the 1-direction. The default value is OFF indicating that the degree of freedom is not retained.

u2 A Boolean specifying whether to retain the degree of freedom in the 2-direction. The default value is OFF indicating that the degree of freedom is not retained.

u3 A Boolean specifying whether to retain the degree of freedom in the 3-direction. The default value is OFF indicating that the degree of freedom is not retained.

ur1 A Boolean specifying whether to retain the rotational degree of freedom about the 1-direction. The default value is OFF indicating that the degree of freedom is not retained.

ur2 A Boolean specifying whether to retain the rotational degree of freedom about the 2-direction. The default value is OFF indicating that the degree of freedom is not retained.

ur3 A Boolean specifying whether to retain the rotational degree of freedom about the 3-direction. The default value is OFF indicating that the degree of freedom is not retained.

Return value

A RetainedNodalDofsBC object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing RetainedNodalDofsBC object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *RetainedNodalDofsBC* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing RetainedNodalDofsBC object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the boundary condition is modified.

Optional arguments

u1 A Boolean specifying whether to retain the degree of freedom in the 1-direction.

u2 A Boolean specifying whether to retain the degree of freedom in the 2-direction.

u3 A Boolean specifying whether to retain the degree of freedom in the 3-direction.

ur1 A Boolean specifying whether to retain the rotational degree of freedom about the 1-direction.

ur2 A Boolean specifying whether to retain the rotational degree of freedom about the 2-direction.

ur3 A Boolean specifying whether to retain the rotational degree of freedom about the 3-direction.

Return value

`None.`

Exceptions

None.

Members

The RetainedNodalDofsBC object can have the following members:

name
A String specifying the boundary condition repository key.

category
A SymbolicConstant specifying the category of the boundary condition. Possible values are MECHANICAL and THERMAL.

region
A *Region* object specifying the region to which the boundary condition is applied.

localCsys
`None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

SecondaryBaseBC object

The SecondaryBaseBC object stores the data for a secondary base boundary condition.

The SecondaryBaseBC object is derived from the *BoundaryCondition* object.

Access

```
import load
mdb.models[name].boundaryConditions[name]
```

SecondaryBaseBC(...)

This method creates a SecondaryBaseBC object.

Path

```
mdb.models[name].SecondaryBaseBC
```

Required arguments

name	A String specifying the boundary condition repository key.
createStepName	A String specifying the name of the step in which the boundary condition is created.
regions	A *RegionArray* object specifying the region to which the boundary condition is applied. Note that the usual *region* is ignored. The default value is MODEL.
dofs	A sequence of sequences of Ints specifying the constrained degrees-of-freedom.

Optional arguments

None.

Return value

A SecondaryBaseBC object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing SecondaryBaseBC object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *SecondaryBaseBC* method, except for the *name* and *createStepName* arguments.

Return value

`None`.

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing SecondaryBaseBC object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the boundary condition is modified.

Optional arguments

None.

Return value

`None`.

Exceptions

None.

Members

The SecondaryBaseBC object can have the following members:

name A String specifying the boundary condition repository key.

dofs A tuple of tuples of Ints specifying the constrained degrees-of-freedom.

regions A *RegionArray* object specifying the region to which the boundary condition is applied. Note that the usual *region* is ignored. The default value is MODEL.

category A SymbolicConstant specifying the category of the boundary condition. Possible values are MECHANICAL and THERMAL.

region A *Region* object specifying the region to which the boundary condition is applied.

localCsys `None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

SecondaryBaseBCState object

The SecondaryBaseBCState object stores the propagating data for a secondary base boundary condition in a step. One instance of this object is created internally by the *SecondaryBaseBC* object for each step. The instance is also deleted internally by the *SecondaryBaseBC* object.

The SecondaryBaseBCState object has no constructor or methods.

The SecondaryBaseBCState object is derived from the *BoundaryConditionState* object.

Access

```
import load
mdb.models[name].steps[name].boundaryConditionStates[name]
```

Members

The SecondaryBaseBCState object has the following members:

amplitudeState

A SymbolicConstant specifying the propagation state of the amplitude reference. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

status

A SymbolicConstant specifying the propagation state of the *BoundaryConditionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- PROPAGATED_FROM_BASE_STATE
- MODIFIED_FROM_BASE_STATE
- DEACTIVATED_FROM_BASE_STATE
- BUILT_INTO_MODES

amplitude

A String specifying the name of the amplitude reference. The String is empty if the boundary condition has no amplitude reference.

Corresponding analysis keywords

- **BOUNDARY*, BASE NAME

SubmodelBC object

The SubmodelBC object stores the data for a submodel boundary condition.

The SubmodelBC object is derived from the *BoundaryCondition* object.

Access

```
import load
mdb.models[name].boundaryConditions[name]
```

SubmodelBC(...)

This method creates a SubmodelBC object.

Path

```
mdb.models[name].SubmodelBC
```

Required arguments

name A String specifying the boundary condition repository key.

createStepName A String specifying the name of the step in which the boundary condition is created.

region A *Region* object specifying the region to which the boundary condition is applied.

dof A sequence of Ints specifying the degrees of freedom to which the boundary condition is applied.

globalStep A String specifying the step in the global model from which Abaqus reads the values of the variables that will drive the submodel analysis. The String indicates the position of the step in the sequence of analysis steps. For example, *globalStep*='1' indicates the first step.

timeScale A Boolean specifying whether to scale the time variable for the driven nodes' amplitude functions to match the submodel analysis step time. The default value is OFF.

shellThickness A Float specifying the thickness of the shell in the global model. This argument is required for shell-to-solid submodeling and is not applicable to other submodels. The default value is 0.0.

Optional arguments

globalDrivingRegion A String specifying the element set in the global model that will be searched for elements whose responses will be used to drive the submodel. An empty string indicates that the entire global model will be searched. The default value is an empty string.

absoluteExteriorTolerance `None` or a Float specifying the absolute value by which a driven node of the submodel can lie outside the region of the elements of the global model. The default value is `None`.

exteriorTolerance

`None` or a Float specifying the fraction of the average element size in the global model by which a driven node of the submodel can lie outside the region of the elements of the global model. The default value is 0.05.

localCsys

`None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

globalIncrement

An Int specifying the increment number in the global model step from which the solution will be used to specify the values of the driven variables. If *globalIncrement*=0, the solution from the last increment will be used. The *globalIncrement* argument is applicable only for linear perturbation steps. The default value is 0.

centerZoneSize

A Float specifying the thickness of the center zone size around the shell midsurface. The default value is `None`.

intersectionOnly

A Boolean specifying whether to ignore driven nodes that lie outside the region of elements of the global model after accounting for the exterior search tolerance. The default value is OFF.

Return value

A SubmodelBC object.

Exceptions

None.

`setValues(...)`

This method modifies the data for an existing SubmodelBC object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *SubmodelBC* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing SubmodelBC object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the boundary condition is modified.

Optional arguments

fixed A Boolean specifying whether the boundary condition should remain fixed at the current values at the start of the step. The default value is ON.

dof A sequence of Ints specifying the degrees of freedom to which the boundary condition is applied. The *dof* argument is applicable only if *fixed*=OFF.

globalStep A String specifying the step in the global model from which Abaqus reads the values of the variables that will drive the submodel analysis. The String indicates the position of the step in the sequence of analysis steps. For example, *globalStep*='1' indicates the first step. The *globalStep* argument is applicable only if *fixed*=OFF.

globalIncrement An Int specifying the increment number in the global model step at which the solution will be used to specify the values of the driven variables. If *globalIncrement*=0, the solution from the last increment will be used. The *globalIncrement* argument is applicable only for linear perturbation steps and if *fixed*=OFF. The default value is 0.

centerZoneSize A Float specifying the thickness of the center zone size around the shell midsurface. The default value is `None`.

The *centerZoneSize* argument is applicable only if *fixed*=OFF.

Return value

`None.`

Exceptions

None.

Members

The SubmodelBC object can have the following members:

name A String specifying the boundary condition repository key.

shellThickness A Float specifying the thickness of the shell in the global model. This argument is required for shell-to-solid submodeling and is not applicable to other submodels. The default value is 0.0.

absoluteExteriorTolerance `None` or a Float specifying the absolute value by which a driven node of the submodel can lie outside the region of the elements of the global model. The default value is `None`.

exteriorTolerance `None` or a Float specifying the fraction of the average element size in the global model by which a driven node of the submodel can lie outside the region of the elements of the global model. The default value is 0.05.

globalDrivingRegion

A String specifying the element set in the global model that will be searched for elements whose responses will be used to drive the submodel. An empty string indicates that the entire global model will be searched. The default value is an empty string.

category

A SymbolicConstant specifying the category of the boundary condition. Possible values are MECHANICAL and THERMAL.

region

A *Region* object specifying the region to which the boundary condition is applied.

localCsys

`None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

SubmodelBCState object

The SubmodelBCState object stores the propagating data for a Submodel boundary condition in a step. One instance of this object is created internally by the *SubmodelBC* object for each step. The instance is also deleted internally by the *SubmodelBC* object.

The SubmodelBCState object has no constructor or methods.

The SubmodelBCState object is derived from the *BoundaryConditionState* object.

Access

```
import load
mdb.models[name].steps[name].boundaryConditionStates[name]
```

Members

The SubmodelBCState object has the following members:

dofState

A SymbolicConstant specifying the propagation state of the *dof* member. Possible values are SET and UNCHANGED.

globalStepState

A SymbolicConstant specifying the propagation state of the *globalStep* member. Possible values are SET and UNCHANGED.

globalIncrement

An Int specifying the increment number in the global model step at which the solution will be used to specify the values of the driven variables. This argument is applicable only for linear perturbation steps.

globalIncrementState

A SymbolicConstant specifying the propagation state of the *globalIncrement* member. Possible values are SET and UNCHANGED.

centerZoneSize

`None` or a Float specifying the thickness of the center zone size around the shell midsurface. The default value is `None`.

centerZoneSizefState

A SymbolicConstant specifying the propagation state of the *centerZoneSize* member. Possible values are SET and UNCHANGED.

scale

`None` or a Float specifying a scaling value applied to the applied displacements at the interface. The default value is 1.0.

scaleState

A SymbolicConstant specifying the propagation state of the *scale* member. Possible values are SET and UNCHANGED.

globalStep

A String specifying the step in the global model from which Abaqus reads the values of the variables that will drive the submodel analysis. The String indicates the position of the step in the sequence of analysis steps. For example, *globalStep*='1' indicates the first step.

dof

A tuple of Ints specifying the degrees of freedom to which the boundary condition is applied.

amplitudeState

A SymbolicConstant specifying the propagation state of the amplitude reference. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

status

A SymbolicConstant specifying the propagation state of the *BoundaryConditionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- PROPAGATED_FROM_BASE_STATE
- MODIFIED_FROM_BASE_STATE
- DEACTIVATED_FROM_BASE_STATE
- BUILT_INTO_MODES

amplitude

A String specifying the name of the amplitude reference. The String is empty if the boundary condition has no amplitude reference.

Corresponding analysis keywords

- **SUBMODEL*
- **BOUNDARY*, SUBMODEL

TemperatureBC object

The TemperatureBC object stores the data for a temperature boundary condition.

The TemperatureBC object is derived from the *BoundaryCondition* object.

Access

```
import load
mdb.models[name].boundaryConditions[name]
```

TemperatureBC(...)

This method creates a TemperatureBC object.

Path

```
mdb.models[name].TemperatureBC
```

Required arguments

name A String specifying the boundary condition repository key.

createStepName A String specifying the name of the step in which the boundary condition is created.

region A *Region* object specifying the region to which the boundary condition is applied.

Optional arguments

fieldName A String specifying the name of the *AnalyticalField* object associated with this boundary condition. The *fieldName* argument applies only when *distributionType*=FIELD. The default value is an empty string.

magnitude A Float specifying the temperature magnitude. The default value is 0.

dof A sequence of Ints specifying the degrees of freedom to which the boundary condition is applied. The default value is (11,).

amplitude A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the boundary condition has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

distributionType A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

fixed A Boolean specifying whether the boundary condition should remain fixed at the current values at the start of the step. The default value is OFF.

Return value

A TemperatureBC object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing TemperatureBC object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *TemperatureBC* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing TemperatureBC object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the boundary condition is modified.

Optional arguments

magnitude A Float or the SymbolicConstant FREED specifying the temperature magnitude.

dof A sequence of Ints specifying the degrees of freedom to which the boundary condition is applied.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the boundary condition is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The TemperatureBC object can have the following members:

name
A String specifying the boundary condition repository key.

distributionType
A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

fieldName
A String specifying the name of the *AnalyticalField* object associated with this boundary condition. The *fieldName* argument applies only when *distributionType*=FIELD. The default value is an empty string.

category
A SymbolicConstant specifying the category of the boundary condition. Possible values are MECHANICAL and THERMAL.

region
A *Region* object specifying the region to which the boundary condition is applied.

localCsys
`None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

TemperatureBCState object

The TemperatureBCState object stores the propagating data for a temperature boundary condition in a step. One instance of this object is created internally by the *TemperatureBC* object for each step. The instance is also deleted internally by the *TemperatureBC* object.

The TemperatureBCState object has no constructor or methods.

The TemperatureBCState object is derived from the *BoundaryConditionState* object.

Access

```
import load
mdb.models[name].steps[name].boundaryConditionStates[name]
```

Members

The TemperatureBCState object has the following members:

magnitude

A Float specifying the temperature magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the temperature magnitude. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

dofState

A SymbolicConstant specifying the propagation state of the *dof* member. Possible values are SET and UNCHANGED.

dof

A tuple of Ints specifying the degrees of freedom to which the boundary condition is applied.

amplitudeState

A SymbolicConstant specifying the propagation state of the amplitude reference. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

status

A SymbolicConstant specifying the propagation state of the *BoundaryConditionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- PROPAGATED_FROM_BASE_STATE
- MODIFIED_FROM_BASE_STATE
- DEACTIVATED_FROM_BASE_STATE
- BUILT_INTO_MODES

amplitude

A String specifying the name of the amplitude reference. The String is empty if the boundary condition has no amplitude reference.

Corresponding analysis keywords

- **BOUNDARY* (degree of freedom: 11 for solids; 11, 12, etc. for shells)

TypeBC object

The TypeBC object stores the data for several types of predefined boundary conditions that are commonly used in stress/displacement analyses.

The TypeBC object is derived from the *BoundaryCondition* object.

Access

```
import load
mdb.models[name].boundaryConditions[name]
```

EncastreBC(...)

This method creates an encastre TypeBC object.

Path

```
mdb.models[name].EncastreBC
```

Required arguments

name	A String specifying the boundary condition repository key.
createStepName	A String specifying the name of the step in which the boundary condition is created.
region	A *Region* object specifying the region to which the boundary condition is applied.

Optional arguments

buckleCase	A SymbolicConstant specifying how the boundary condition is defined in a **BUCKLE* analysis. Possible values are NOT_APPLICABLE, STRESS_PERTURBATION, BUCKLING_MODES, and PERTURBATION_AND_BUCKLING. The default value is NOT_APPLICABLE.
localCsys	`None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

Return value

A TypeBC object.

Exceptions

None.

PinnedBC(...)

This method creates a pinned TypeBC object.

Path

```
mdb.models[name].PinnedBC
```

Required arguments

name A String specifying the boundary condition repository key.

createStepName A String specifying the name of the step in which the boundary condition is created.

region A *Region* object specifying the region to which the boundary condition is applied.

Optional arguments

buckleCase A SymbolicConstant specifying how the boundary condition is defined in a **BUCKLE* analysis. Possible values are NOT_APPLICABLE, STRESS_PERTURBATION, BUCKLING_MODES, and PERTURBATION_AND_BUCKLING. The default value is NOT_APPLICABLE.

localCsys `None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

Return value

A TypeBC object.

Exceptions

None.

XsymmBC(...)

This method creates a TypeBC object that specifies symmetry about the *X*-axis.

Path

```
mdb.models[name].XsymmBC
```

Required arguments

name A String specifying the boundary condition repository key.

createStepName A String specifying the name of the step in which the boundary condition is created.

region A *Region* object specifying the region to which the boundary condition is applied.

Optional arguments

buckleCase A SymbolicConstant specifying how the boundary condition is defined in a **BUCKLE* analysis. Possible values are NOT_APPLICABLE, STRESS_PERTURBATION, BUCKLING_MODES, and PERTURBATION_AND_BUCKLING. The default value is NOT_APPLICABLE.

localCsys `None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

Return value

A TypeBC object.

Exceptions

None.

YsymmBC(...)

This method creates a TypeBC object that specifies symmetry about the *Y*-axis.

Path

```
mdb.models[name].YsymmBC
```

Required arguments

name A String specifying the boundary condition repository key.

createStepName A String specifying the name of the step in which the boundary condition is created.

region A *Region* object specifying the region to which the boundary condition is applied.

Optional arguments

buckleCase A SymbolicConstant specifying how the boundary condition is defined in a **BUCKLE* analysis. Possible values are NOT_APPLICABLE, STRESS_PERTURBATION, BUCKLING_MODES, and PERTURBATION_AND_BUCKLING. The default value is NOT_APPLICABLE.

localCsys `None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

Return value

A TypeBC object.

Exceptions

None.

ZsymmBC(...)

This method creates a TypeBC object that specifies symmetry about the *Z*-axis.

Path

```
mdb.models[name].ZsymmBC
```

Required arguments

name A String specifying the boundary condition repository key.

createStepName A String specifying the name of the step in which the boundary condition is created.

region A *Region* object specifying the region to which the boundary condition is applied.

Optional arguments

buckleCase A SymbolicConstant specifying how the boundary condition is defined in a **BUCKLE* analysis. Possible values are NOT_APPLICABLE, STRESS_PERTURBATION, BUCKLING_MODES, and PERTURBATION_AND_BUCKLING. The default value is NOT_APPLICABLE.

localCsys `None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

Return value

A TypeBC object.

Exceptions

None.

XasymmBC(...)

This method creates a TypeBC object that specifies antisymmetry about the *X*-axis.

Path

```
mdb.models[name].XasymmBC
```

Required arguments

name A String specifying the boundary condition repository key.

createStepName A String specifying the name of the step in which the boundary condition is created.

region A *Region* object specifying the region to which the boundary condition is applied.

Optional arguments

buckleCase A SymbolicConstant specifying how the boundary condition is defined in a **BUCKLE* analysis. Possible values are NOT_APPLICABLE, STRESS_PERTURBATION, BUCKLING_MODES, and PERTURBATION_AND_BUCKLING. The default value is NOT_APPLICABLE.

localCsys `None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

Return value

A TypeBC object.

Exceptions

None.

YasymmBC(...)

This method creates a TypeBC object that specifies antisymmetry about the *Y*-axis.

Path

```
mdb.models[name].YasymmBC
```

Required arguments

name A String specifying the boundary condition repository key.

createStepName A String specifying the name of the step in which the boundary condition is created.

region A *Region* object specifying the region to which the boundary condition is applied.

Optional arguments

buckleCase A SymbolicConstant specifying how the boundary condition is defined in a **BUCKLE* analysis. Possible values are NOT_APPLICABLE, STRESS_PERTURBATION, BUCKLING_MODES, and PERTURBATION_AND_BUCKLING. The default value is NOT_APPLICABLE.

localCsys `None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

Return value

A TypeBC object.

Exceptions

None.

ZasymmBC(...)

This method creates a TypeBC object that specifies antisymmetry about the *Z*-axis.

Path

```
mdb.models[name].ZasymmBC
```

Required arguments

name A String specifying the boundary condition repository key.

createStepName A String specifying the name of the step in which the boundary condition is created.

region A *Region* object specifying the region to which the boundary condition is applied.

Optional arguments

buckleCase A SymbolicConstant specifying how the boundary condition is defined in a **BUCKLE* analysis. Possible values are NOT_APPLICABLE, STRESS_PERTURBATION, BUCKLING_MODES, and PERTURBATION_AND_BUCKLING. The default value is NOT_APPLICABLE.

localCsys `None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

Return value

A TypeBC object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing TypeBC object in the step where it is created.

Required arguments

None.

Optional arguments

region A *Region* object specifying the region to which the boundary condition is applied.

typeName A SymbolicConstant specifying the predefined boundary condition type. Possible values are XSYMM, YSYMM, ZSYMM, XASYMM, YASYMM, ZASYMM, PINNED, and ENCASTRE.

buckleCase A SymbolicConstant specifying how the boundary condition is defined in a **BUCKLE* analysis. Possible values are NOT_APPLICABLE, STRESS_PERTURBATION, BUCKLING_MODES, and PERTURBATION_AND_BUCKLING. The default value is NOT_APPLICABLE.

localCsys `None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

Return value

`None`.

Exceptions

None.

`setValuesInStep(...)`

This method always returns a value error for a TypeBC; it is inherited from the *BoundaryCondition* object.

Required arguments

stepName A String specifying the name of the step in which the boundary condition is modified.

Optional arguments

typeName A SymbolicConstant specifying the predefined boundary condition type. Possible values are XSYMM, YSYMM, ZSYMM, XASYMM, YASYMM, ZASYMM, PINNED, and ENCASTRE.

Return value

`None`.

Exceptions

Value Error: A Symmetry/Antisymmetry/Encastre BC cannot be edited in a propagated step.

Members

The TypeBC object can have the following members:

name A String specifying the boundary condition repository key.

buckleCase A SymbolicConstant specifying how the boundary condition is defined in a **BUCKLE* analysis. Possible values are NOT_APPLICABLE, STRESS_PERTURBATION, BUCKLING_MODES, and PERTURBATION_AND_BUCKLING. The default value is NOT_APPLICABLE.

category A SymbolicConstant specifying the category of the boundary condition. Possible values are MECHANICAL and THERMAL.

region

A *Region* object specifying the region to which the boundary condition is applied.

localCsys

`None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

TypeBCState object

The TypeBCState object stores the propagating data for a predefined boundary condition in a step. One instance of this object is created internally by the *TypeBC* object for each step. The instance is also deleted internally by the *TypeBC* object.

The TypeBCState object has no constructor or methods.

The TypeBCState object is derived from the *BoundaryConditionState* object.

Access

```
import load
mdb.models[name].steps[name].boundaryConditionStates[name]
```

Members

The TypeBCState object has the following members:

typeName

A SymbolicConstant specifying the predefined boundary condition type. Possible values are XSYMM, YSYMM, ZSYMM, XASYMM, YASYMM, ZASYMM, PINNED, and ENCASTRE.

typeNameState

A SymbolicConstant specifying the propagation state of the predefined boundary condition type. The only possible value is UNCHANGED.

amplitudeState

A SymbolicConstant specifying the propagation state of the amplitude reference. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

status

A SymbolicConstant specifying the propagation state of the *BoundaryConditionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- PROPAGATED_FROM_BASE_STATE
- MODIFIED_FROM_BASE_STATE
- DEACTIVATED_FROM_BASE_STATE
- BUILT_INTO_MODES

amplitude

A String specifying the name of the amplitude reference. The String is empty if the boundary condition has no amplitude reference.

Corresponding analysis keywords

- **BOUNDARY*, TYPE=XSYMM, YSYMM, ZSYMM, XASYMM, YASYMM, ZASYMM, PINNED, or ENCASTRE

VelocityBaseMotionBC object

The VelocityBaseMotionBC object stores the data for a velocity base motion boundary condition.

The VelocityBaseMotionBC object is derived from the *BoundaryCondition* object.

Access

```
import load
mdb.models[name].boundaryConditions[name]
```

VelocityBaseMotionBC(...)

This method creates a VelocityBaseMotionBC object.

Path

```
mdb.models[name].VelocityBaseMotionBC
```

Required arguments

name A String specifying the boundary condition repository key.

createStepName A String specifying the name of the step in which the boundary condition is created.

dof A SymbolicConstant specifying the constrained degree-of-freedom. Possible values for the SymbolicConstant are U1, U2, U3, UR1, UR2, UR3. The default value is U1.

Optional arguments

amplitudeScaleFactor A Float specifying the scale factor for the amplitude curve. The default value is 1.0.

centerOfRotation A *ModelDot* object specifying a tuple containing one center of rotation. The default value is the global origin. This argument applies only when *dof*=UR1, UR2, or UR3.

correlation A *CorrelationArray* object.

secondaryBase A String specifying the name of the *SecondaryBaseBC* object associated with this boundary condition. The default value is an empty string.

useComplex A Boolean specifying whether to define the imaginary (out-of-plane) portion of the base motion record given by amplitude definition. The default value is OFF.

amplitude A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the boundary condition has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

A VelocityBaseMotionBC object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing VelocityBaseMotionBC object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *VelocityBaseMotionBC* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing VelocityBaseMotionBC object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the boundary condition is modified.

Optional arguments

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the boundary condition is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The VelocityBaseMotionBC object can have the following members:

name

A String specifying the boundary condition repository key.

amplitudeScaleFactor

A Float specifying the scale factor for the amplitude curve. The default value is 1.0.

useComplex

A Boolean specifying whether to define the imaginary (out-of-plane) portion of the base motion record given by amplitude definition. The default value is OFF.

centerOfRotation

A *ModelDot* object specifying a tuple containing one center of rotation. The default value is the global origin. This argument applies only when *dof*=UR1, UR2, or UR3.

correlation

A *CorrelationArray* object.

secondaryBase

A String specifying the name of the *SecondaryBaseBC* object associated with this boundary condition. The default value is an empty string.

category

A SymbolicConstant specifying the category of the boundary condition. Possible values are MECHANICAL and THERMAL.

region

A *Region* object specifying the region to which the boundary condition is applied.

localCsys

`None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

VelocityBaseMotionBCState object

The VelocityBaseMotionBCState object stores the propagating data for a velocity base motion boundary condition in a step. One instance of this object is created internally by the *VelocityBaseMotionBC* object for each step. The instance is also deleted internally by the *VelocityBaseMotionBC* object.

The VelocityBaseMotionBCState object has no constructor or methods.

The VelocityBaseMotionBCState object is derived from the *BoundaryConditionState* object.

Access

```
import load
mdb.models[name].steps[name].boundaryConditionStates[name]
```

Members

The VelocityBaseMotionBCState object has the following members:

amplitudeState

A SymbolicConstant specifying the propagation state of the amplitude reference. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

status

A SymbolicConstant specifying the propagation state of the *BoundaryConditionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- PROPAGATED_FROM_BASE_STATE
- MODIFIED_FROM_BASE_STATE
- DEACTIVATED_FROM_BASE_STATE
- BUILT_INTO_MODES

amplitude

A String specifying the name of the amplitude reference. The String is empty if the boundary condition has no amplitude reference.

Corresponding analysis keywords

- **BASE MOTION*

VelocityBC object

The VelocityBC object stores the data for a velocity boundary condition.

The VelocityBC object is derived from the *BoundaryCondition* object.

Access

```
import load
mdb.models[name].boundaryConditions[name]
```

VelocityBC(...)

This method creates a VelocityBC object.

Path

```
mdb.models[name].VelocityBC
```

Required arguments

name A String specifying the boundary condition repository key.

createStepName A String specifying the name of the step in which the boundary condition is created.

region A *Region* object specifying the region to which the boundary condition is applied.

Optional arguments

fieldName A String specifying the name of the *AnalyticalField* object associated with this boundary condition. The *fieldName* argument applies only when *distributionType*=FIELD. The default value is an empty string.

v1 A Float or a SymbolicConstant specifying the velocity component in the 1-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

Note:

Although *v1*, *v2*, *v3*, *vr1*, *vr2*, and *vr3* are optional arguments, at least one of them must be specified.

v2 A Float or a SymbolicConstant specifying the velocity component in the 2-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

v3 A Float or a SymbolicConstant specifying the velocity component in the 3-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

vr1 A Float or a SymbolicConstant specifying the rotational velocity component about the 1-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

vr2
A Float or a SymbolicConstant specifying the rotational velocity component about the 2-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

vr3
A Float or a SymbolicConstant specifying the rotational velocity component about the 3-direction. Possible values for the SymbolicConstant are UNSET and SET. The default value is UNSET.

amplitude
A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the boundary condition has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

localCsys
`None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

distributionType
A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

Return value

A VelocityBC object.

Exceptions

None.

`setValues(...)`

This method modifies the data for an existing VelocityBC object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *VelocityBC* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing VelocityBC object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the boundary condition is modified.

Optional arguments

v1 A Float or a SymbolicConstant specifying the velocity component in the 1-direction. Possible values for the SymbolicConstant are SET and FREED.

v2 A Float or a SymbolicConstant specifying the velocity component in the 2-direction. Possible values for the SymbolicConstant are SET and FREED.

v3 A Float or a SymbolicConstant specifying the velocity component in the 3-direction. Possible values for the SymbolicConstant are SET and FREED.

vr1 A Float or a SymbolicConstant specifying the rotational velocity component about the 1-direction. Possible values for the SymbolicConstant are SET and FREED.

vr2 A Float or a SymbolicConstant specifying the rotational velocity component about the 2-direction. Possible values for the SymbolicConstant are SET and FREED.

vr3 A Float or a SymbolicConstant specifying the rotational velocity component about the 3-direction. Possible values for the SymbolicConstant are SET and FREED.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the boundary condition is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The VelocityBC object can have the following members:

name A String specifying the boundary condition repository key.

distributionType A SymbolicConstant specifying how the boundary condition is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

fieldName A String specifying the name of the *AnalyticalField* object associated with this boundary condition. The *fieldName* argument applies only when *distributionType*=FIELD. The default value is an empty string.

category

A SymbolicConstant specifying the category of the boundary condition. Possible values are MECHANICAL and THERMAL.

region

A *Region* object specifying the region to which the boundary condition is applied.

localCsys

`None` or a *DatumCsys* object specifying the local coordinate system of the boundary condition's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. The default value is `None`.

VelocityBCState object

The VelocityBCState object stores the propagating data for a velocity boundary condition in a step. One instance of this object is created internally by the *VelocityBC* object for each step. The instance is also deleted internally by the *VelocityBC* object.

The VelocityBCState object has no constructor or methods.

The VelocityBCState object is derived from the *BoundaryConditionState* object.

Access

```
import load
mdb.models[name].steps[name].boundaryConditionStates[name]
```

Members

The VelocityBCState object has the following members:

v1

A Float specifying the velocity component in the 1-direction.

v2

A Float specifying the velocity component in the 2-direction.

v3

A Float specifying the velocity component in the 3-direction.

vr1

A Float specifying the rotational velocity component about the 1-direction.

vr2

A Float specifying the rotational velocity component about the 2-direction.

vr3

A Float specifying the rotational velocity component about the 3-direction.

v1State

A SymbolicConstant specifying the propagation state of the velocity component in the 1-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

v2State

A SymbolicConstant specifying the propagation state of the velocity component in the 2-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

v3State

A SymbolicConstant specifying the propagation state of the velocity component in the 3-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

vr1State

A SymbolicConstant specifying the propagation state of the rotational velocity component about the 1-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

vr2State

A SymbolicConstant specifying the propagation state of the rotational velocity component about the 2-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

vr3State

A SymbolicConstant specifying the propagation state of the rotational velocity component about the 3-direction. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

amplitudeState A SymbolicConstant specifying the propagation state of the amplitude reference. Possible values are UNSET, SET, UNCHANGED, FREED, and MODIFIED.

status A SymbolicConstant specifying the propagation state of the *BoundaryConditionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- PROPAGATED_FROM_BASE_STATE
- MODIFIED_FROM_BASE_STATE
- DEACTIVATED_FROM_BASE_STATE
- BUILT_INTO_MODES

amplitude A String specifying the name of the amplitude reference. The String is empty if the boundary condition has no amplitude reference.

Corresponding analysis keywords

- **BOUNDARY*, TYPE=VELOCITY (degree of freedom: 1, 2, 3, 4, 5, or 6)

Calibration commands

The calibration commands are used for material calibration.

In this section:

- *Calibration object*
- *Behavior object*
- *DataSet object*

Calibration object

A Calibration object is the object used to specify a material calibration. The Calibration object stores the data that is used for specifying materials from test data.

Access

```
import calibration
mdb.models[name].calibrations[name]
```

Calibration(...)

This method creates a Calibration object.

Path

```
mdb.models[name].Calibration
```

Required arguments

name A String specifying the name of the new calibration.

Optional arguments

None.

Return value

A Calibration object.

Exceptions

InvalidNameError.

Members

The Calibration object has members with the same names and descriptions as the arguments to the *Calibration* method.

In addition, the Calibration object can have the following members:

dataSets A *DataSet* object.

behaviors A *Behavior* object.

Behavior object

The Behavior object specifies the method used for calibrating a material.

Access

```
import calibration
mdb.models[name].calibrations[name].behaviors[name]
```

Behavior(...)

This method creates a Behavior object.

Path

```
mdb.models[name].calibrations[name].Behavior
```

Required arguments

name A String specifying the name of the new behavior.

typeName A String specifying the type of the new Behavior. Values can be "ElasIsoBehavior", "ElasPlasIsoBehavior", "FeFpBehavior", or a user plug-in behavior type.

Optional arguments

None.

Return value

A Behavior object.

Exceptions

InvalidNameError.

setValues(...)

This method modifies the data for an existing behavior object.

Required arguments

None.

Optional arguments

E Young's modulus. Only valid if the behavior type is ElasIsoBehavior.

nu
Poisson's ratio. Only valid if the behavior type is ElasIsoBehavior.

ds1Name
The name of the first data set. Only valid if the behavior type is ElasIsoBehavior or ElasPlasIsoBehavior

ds2Name
The name of the second data set. Only valid if the behavior type is ElasIsoBehavior or ElasPlasIsoBehavior

materialName
Material Name.

yieldPoint
Stress/strain value for the material yield point.Only valid if the behavior type is ElasPlasIsoBehavior

ultimatePoint
Stress/strain value for the material ultimate point.Only valid if the behavior type is ElasPlasIsoBehavior

plasticPoints
Stress/strain values for the plastic portion of material curve. Only valid if the behavior type is ElasPlasIsoBehavior

PoissonsRatio
Poisson's Ratio. Only valid if the behavior type is ElasPlasIsoBehavior

elasticModulus
Young's Modulus for the elastic portion of the material curve. Only valid if the behavior type is ElasPlasIsoBehavior

plasticPointsRange
Extent of the material plastic points. Only valid if the behavior type is ElasPlasIsoBehavior

name
Name of the behavior.

uniaxialName
Name of the uniaxial dataset. Only valid if the behavior type is FeFpBehavior

biaxialName
Name of the biaxial dataset. Only valid if the behavior type is FeFpBehavior

interpolation
'linear' specifies linear interpolation between data points, otherwise 'logarithmic'. Only valid if the behavior type is FeFpBehavior

uniWeight
Uniaxial weight factor, uniWeight + biWeight should equal 1.0. Only valid if the behavior type is FeFpBehavior

biWeight
Biaxial weight factor, uniWeight + biWeight should equal 1.0. Only valid if the behavior type is FeFpBehavior

uMullinsReload
A List of strings, specifying names of reloading DataSet objects obtained from uniaxial test data. Only valid if the behavior is of type FeFpBehavior

uMullinsUnload
A List of strings, specifying names of reloading DataSet objects obtained from uniaxial test data. Only valid if the behavior is of type FeFpBehavior

uPYieldPoint
A tuple specifying the coordinates of yield point of the permanent data set. Only valid if the behavior is of type FeFpBehavior

uPermSet
A List of strings, specifying names of permanent DataSet objects obtained from uniaxial test data. Only valid if the behavior is of type FeFpBehavior

uPrimary
A string specifying name of Primary DataSet object.Only valid if the behavior is of type FeFpBehavior

bMullinsReload
A List of strings, specifying names of reloading DataSet objects obtained from biaxial test data. Only valid if the behavior is of type FeFpBehavior

bMullinsUnload
A List of strings, specifying names of unloading DataSet objects obtained from biaxial test data. Only valid if the behavior is of type FeFpBehavior

bPYieldPoint
A tuple specifying the coordinates of yield point of the permanent data set. Only valid if the behavior is of type FeFpBehavior

bPermSet
A List of strings, specifying names of permanent DataSet objects obtained from biaxial test data. Only valid if the behavior is of type FeFpBehavior

bPrimary
A string specifying name of Primary DataSet object. Only valid if the behavior is of type FeFpBehavior

Return value
`None.`

Exceptions
None.

`mapToMaterial(...)`

This method appends the calibration data obtained from the DataSet object to an existing material object. In the case of ElasIsoBehavior, it appends the young's modulus and poisson's ratio. For ElasPlasIsoBehavior it appends the young's modulus, poisson's ratio and plastic points range and for FeFpBehavior it appends plastic points range and Mullins effect properties.

Required arguments
materialName
A String specifying the name of the existing material

Optional arguments
None.

Return value
`None.`

Exceptions

None.

compute_E(...)

This method computes the value of young's modulus from the existing DataSet object. The method is only valid for ElasIsoBehavior type of behavior.

Required arguments

dataSet A *DataSet* object.

Optional arguments

None.

Return value

A tuple consisting of a and b values of the regression line(y = ax + b), coefficient of determination(r-squared) value and the start and end-points of the line.

Exceptions

None.

compute_nu(...)

This method computes the value of Poisson's Ratio from the existing DataSet object. The method is only valid for ElasIsoBehavior and ElasPlasIsoBehavior type of behavior.

Required arguments

dataSet A *DataSet* object.

Optional arguments

None.

Return value

A tuple consisting of a and b values of the regression line(y = ax + b), coefficient of determination(r-squared) value and the start and end-points of the line.

Exceptions

None.

compute_ultimatePoint(...)

This method computes the coordinates of the Ultimate point from the existing DataSet object. The method is only valid for ElasPlasIsoBehavior type of behavior.

Required arguments

dataSet	A *DataSet* object.

Optional arguments

None.

Return value

Coordinates of the ultimate point.

Exceptions

None.

`compute_elasticModulus(...)`

This method computes the value of the elastic modulus from the yieldpoint value. The method is only valid for ElasPlasIsoBehavior type of behavior.

Required arguments

yieldPoint	A tuple consisting of coordinates of the yieldpoint.

Optional arguments

None.

Return value

A float specifying the value of elastic modulus.

Exceptions

None.

`compute_plasticPoints(...)`

This method extracts the coordinates of the plastic Points. The method is only valid for ElasPlasIsoBehavior type of behavior.

Required arguments

dataSet	A *DataSet* object.
slider_val	A float specifying the number of values to be taken.
start_index	A float specifying the lower limit of the range.
end_index	A float specifying the upper limit of the range.

Optional arguments

yp Coordinates of the yieldpoint. The default value is (0,0).

Return value

A sequence of coordinates of the plastic points.

Exceptions

None.

`xyDataDissect(...)`

This method extracts primary, unload, reload and permanent DataSet objects from the existing DataSet object.The method is only valid for FeFpBehavior type of behavior.

Required arguments

dsName A string specifying the name of the uniaxial/biaxial test dataset.

modelName A string specifying the name of the model to which the calibration behavior belongs.

calibrationName A string specifying the name of the Calibration object to which the behavior belongs.

Optional arguments

biaxial A boolean specifying whether the test data is biaxial or uniaxial. The default value is True.

Return value

A sequence of strings specifying names of the DataSet objects containing loading, unloading, reloading and primary datasets.

Exceptions

None.

Members

The Behavior object has members with the same names and descriptions as the arguments to the *Behavior* method and *setValues* method.

In addition, the Behavior object can have the following members:

modelName A string specifying the name of the model to which the behavior belongs.

calibrationName A string specifying the name of calibration to which the behavior belongs.

biAxialAllName

A String specifying the name of the dataset containing all the raw data in the test data file. Only valid if the behavior is of type FeFpBehavior

uniAxialAllName

A String specifying the name of the dataset containing all the raw data in the test data file. Only valid if the behavior is of type FeFpBehavior

DataSet object

The DataSetobject specifies material test data.

Access

```
import calibration
mdb.models[name].calibrations[name].dataSets[name]
```

DataSet(...)

This method creates a DataSet object.

Path

```
mdb.models[name].calibrations[name].DataSet
```

Required arguments

name A String specifying the name of the new dataset.

Optional arguments

data A sequence of pairs of Floats specifying data set type pairs. Possible values are for stress/strain, force/displacement, or transverse strain/axial strain pairs.

type A String specifying the type of the new dataset. Values can be "STRESS/STRAIN", "FORCE/DISPLACEMENT", or "AXIALSTRAIN/TRANSVERSESTRAIN". The default value is "STRESS/STRAIN".

form A String specifying the form of the new dataset. Values can be "NOMINAL" or "TRUE". The default value is "NOMINAl".

Return value

A DataSet object.

Exceptions

InvalidNameError.

setValues(...)

This method modifies the data for an existing DataSet object.

Required arguments

None.

Optional arguments

data A sequence of pairs of Floats specifying data set type pairs.

Return value

`None.`

Exceptions

None.

Members

The DataSet object has members with the same names and descriptions as the arguments to the *DataSet* method.

Canvas commands

Canvas commands are used to create, position, and modify canvas objects.
The Canvas commands need only the `abaqus` module to be imported; no additional modules need to be imported.

In this section:

- *AttributeColorMap object*
- *DrawingArea object*
- *Layer object*
- *Viewport object*
- *ImageOptions object*
- *MovieOptions object*
- *Highlight commands*

AttributeColorMap object

The AttributeColorMap object is used to store values and attributes associated with AttributeColorMap type objects. AttributeColorMap objects can be modified using the methods described below. The methods accessed via the *Viewport* object cause the AttributeColorMap object to be updated in the session.viewports[name].colorMappings repository.

Access

```
session.viewports[name].colorMappings[name]
```

setDefaults()

This method resets the AttributeColorMap object to its default state.

Arguments

None.

Return value

None.

Exceptions

None.

setValues(...)

This method modifies the AttributeColorMap object.

Required arguments

None.

Optional arguments

At least one of the following must be provided:

overrides

A Dictionary object specifying a color mapping. Each key is of String type and specifies an attribute in the map; the corresponding values specify the color definition to apply to that attribute in the form (0|1, wire color, edge color, face color). The 0|1 defines the active status for the attribute. For example:

```
overrides={
                           'Part-1':(1,'#00FF00', '#00CCFF',
                           '#00FF00')}
```

defaultOverrides

A Dictionary object specifying a custom color mapping similar to overrides. For example:

```
defaultOverrides={
                           'Copper':(1,''#00FF00', '#00CCFF',
                           '#00FF00')}
```

The color mapping can contain keys that have not been created. When the key is created, it gets the appropriate values from this mapping.

Return value
`None.`

Exceptions
None.

updateOverrides(...)

This method specifies additional overrides to be added to the current object definition.

Required arguments
None.

Optional arguments
At least one of the following must be provided:

overrides A Dictionary object specifying a color mapping. Each key is of String type and specifies an attribute in the map; the corresponding values specify the color definition to apply to that attribute in the form (0|1, wire color, edge color, face color). The 0|1 defines the active status for the attribute. For example:

```
overrides={
                          'Part-1':(1,'#00FF00', '#00CCFF',
                          '#00FF00')}
```

defaultOverrides A Dictionary object specifying a custom color mapping similar to overrides. For example:

```
defaultOverrides={
                          'Copper':(1,''#00FF00', '#00CCFF',
                          '#00FF00')}
```

The color mapping can contain keys that have not been created. When the key is created, it gets the appropriate values from this mapping.

Return value
`None.`

Exceptions
None.

Members

The AttributeColorMap object has the following members:

mapType A SymbolicConstant specifying the type of AttributeColorMap . Possible values are MATERIAL_MAP, SECTION_MAP, PART_MAP, ELSET_MAP, AVERAGING_REGION_MAP, and ELTYPE_MAP.

overrides A Dictionary object specifying a color mapping. Each key is of String type and specifies an attribute in the map; the corresponding values specify the color definition to apply to that attribute

in the form (0|1, wire color, edge color, face color). The 0|1 defines the active status for the attribute. For example:

```
overrides={
                          'Part-1':(1,'#00FF00', '#00CCFF',
                          '#00FF00')}
```

defaultOverrides

A Dictionary object specifying a custom color mapping similar to overrides. For example:

```
defaultOverrides={
                          'Copper':(1,''#00FF00', '#00CCFF',
                          '#00FF00')}
```

The color mapping can contain keys that have not been created. When the key is created, it gets the appropriate values from this mapping.

attributeColors

A Dictionary object specifying the color settings of each attribute as described in the *updateOverrides* method.

DrawingArea object

The DrawingArea object specifies the location and size of the drawing area used for placement of viewports.

Access

```
session.drawingArea
```

Members

The DrawingArea object has the following members:

width A Float specifying the width in millimeters.

height A Float specifying the height in millimeters.

origin A pair of Floats specifying the coordinates of the bottom left hand corner in millimeters.

Layer object

Objects can be superimposed by displaying them in different layers of a viewport.

Access

```
session.viewports[name].layers[name]
```

Layer(...)

This method creates a Layer object in the Layer repository.

Path

```
session.viewports[name].Layer
```

Required arguments

name A String specifying the repository key.

Optional arguments

copyViewName A String specifying the name of the layer to copy.

Return value

A Layer object.

Exceptions

None.

moveBefore(...)

This method moves the layer object before another object in the layer repository.

Required arguments

name A String specifying the name of the other Layer object.

Optional arguments

None.

Return value

```
None.
```

Exceptions

None.

moveAfter(...)

This method moves the layer object after another object in the layer repository.

Required arguments

name A String specifying the name of the other Layer object.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

Members

The Layer object has members with the same names and descriptions as the arguments to the *Layer* method.

In addition, the Layer object can have the following members:

displayedObject A Displayable object specifying the object to be displayed. The Displayable type is an abstract generalization. The concrete possible types are *Part*, *Assembly*, *ConstrainedSketch*, *Odb*, or *XYPlot*.

view A *View* object specifying the object that controls viewing of the layer.

odbDisplay An *OdbDisplay* object specifying the display options for the *Odb* object.

partDisplay A *PartDisplayOptions* object specifying the display options for the *Part* object.

assemblyDisplay An *AssemblyDisplayOptions* object specifying the display options for the *Assembly* object.

Viewport object

A viewport is the container for the graphics generated by the application. TheViewport object stores the various settings that determine how objects are displayed within that viewport.

Access

```
session.viewports[name]
```

Viewport(...)

This method creates a Viewport object with the specified origin and dimensions.

Path

```
session.Viewport
```

Required arguments

name A String specifying the repository key.

Optional arguments

origin A pair of Floats specifying the *X*- and *Y*-coordinates in millimeters in the canvas coordinate system of the lower left corner of the viewport. The default origin is (0, 0).

width A Float specifying the width in millimeters of the viewport. Possible values are $30 \leq$ *width* $\leq$ (*maxWidth*). The default value is 120.0.

Note:

The maximum value of width (*maxWidth*) is the width of the screen in millimeters.

height A Float specifying the height in millimeters of the viewport. This height includes the title bar. Possible values are $30 \leq$ *height* $\leq$ (*maxHeight*). The default value is 80.0.

Note:

The maximum value of height (*maxHeight*) is the height of the screen in millimeters.

border A Boolean specifying whether the viewport border is visible in a printed image. The default value is ON.

titleBar A Boolean specifying whether the viewport title should be displayed in a printed image. The default value is ON.

If *border* = OFF, the title will not be visible, even if *titleBar* =ON.

titleStyle A SymbolicConstant specifying which title to use for the viewport title. Possible values are CUSTOM and SYSTEM. The default value is SYSTEM.

If *titleStyle* = CUSTOM, *customTitleString* will be used. If *titleStyle*= SYSTEM, a system-generated string will be used.

customTitleString

A String specifying the viewport title when *titleStyle* =CUSTOM. The default value is an empty string.

Return value

A Viewport object.

Exceptions

RangeError.

If the user attempts to delete the only viewport:	SystemError: the current viewport may not be deleted.
If *width* is out of range:	RangeError: width must be a Float in the range: 30 <= width <= *maxWidth*
If *height* is out of range:	RangeError: height must be a Float in the range: 30 <= width <= *maxHeight*

`bringToFront()`

This method moves the Viewport object to the front.

Arguments

None.

Return value

`None.`

Exceptions

None.

`disableMultipleColors()`

This method disables applying multiple color mappings that was enabled using `enableMultipleColors`

Arguments

None.

Return value

`None.`

Exceptions

None.

disableRefresh()

This method disables Viewport refresh. Some methods that require the Viewport to be up-to-date will override this setting. It is advisable to use this method sparingly.

Arguments

None.

Return value

`None.`

Exceptions

None.

disableColorCodeUpdates()

This method disables Viewport updates and internal computations triggered because of color coding. Performance improvement will be significant when color coding is ON and repeating operations are performed using a script each of which requires color code updates. No benefit will be had when color coding is OFF.

Arguments

None.

Return value

`None.`

Exceptions

None.

enableMultipleColors()

This method enables multiple color mappings to be applied at the same time. It also ensures that the Viewport is updated correctly when *initialColor* is set.

Arguments

None.

Return value

`None.`

Exceptions

None.

enableRefresh()

This method enables Viewport refresh disabled using `disableRefresh`.

Arguments

None.

Return value

`None.`

Exceptions

None.

enableColorCodeUpdates()

This method enables Viewport color code updates disabled using `disableColorCodeUpdates`.

Arguments

None.

Return value

`None.`

Exceptions

None.

getActiveElementLabels(...)

This method returns the element labels currently active in the viewport based on the current display group. The element labels are printed only when the *displayedObject* member in the Viewport object is set to an Odb. The `getActiveElementLabels` method has the following arguments:

Required arguments

None.

Optional arguments

useCut A Boolean flag to specify if any active cutting plane is to be considered in determining active elements.

printResults A Boolean flag to specify if the active element labels are to be printed to the replay file.

Return value

A Dictionary object of element labels, keyed by OdbInstance name. Returns `None` if the *displayedObject* member is not an Odb object.

Exceptions

None.

getActiveNodeLabels(...)

This method returns the node labels currently active in the viewport based on the current display group. The node labels are printed only when the *displayedObject* member in the Viewport object is set to an Odb. The `getActiveNodeLabels` method has the following arguments:

Required arguments

None.

Optional arguments

useCut A Boolean flag to specify if any active cutting plane is to be considered in determining active nodes.

printResults A Boolean flag to specify if the active node labels are to be printed to the replay file.

Return value

A Dictionary object of node labels, keyed by OdbInstance name. Returns `None` if the *displayedObject* member is not an Odb object.

Exceptions

None.

getPrimVarMinMaxLoc()

This method returns a dictionary containing the minimum, maximum and their location for the current primary variable. A contour plot should be displayed in the current viewport or else the method will return *None*.

Arguments

None.

Return value

A dictionary with keys 'minPartInstanceName', 'minElementLabel', 'minNodeLabel', 'minPosition', 'maxPartInstanceName', 'maxElementLabel', 'maxNodeLabel', 'maxPosition'

Exceptions

None.

makeCurrent()

This method makes theViewport object the current viewport.

Arguments

None.

Return value
`None.`

Exceptions

None.

maximize()

This method maximizes the Viewport object to fill the drawing area.

Arguments

None.

Return value
`None.`

Exceptions

None.

minimize()

This method minimizes the Viewport object to appear as an abbreviated title bar.

Arguments

None.

Return value
`None.`

Exceptions

None.

offset(...)

This method modifies the current *X*-*Y* location of the viewport by the specified distance.

Required arguments

None.

Optional arguments

deltaX
A Float specifying the offset in millimeters of the *X*-component of the viewport origin. The default value is 0.

deltaY
A Float specifying the offset in millimeters of the *Y*-component of the viewport origin. The default value is 0.

Return value
`None.`

Exceptions
None.

restore()

This method restores a maximized or minimized Viewport object to its previous size and location.

Arguments
None.

Return value
`None.`

Exceptions
None.

sendToBack()

This method moves the Viewport object to the back.

Arguments
None.

Return value
`None.`

Exceptions
None.

setColor(...)

This method specifies the color assignment using *initialColor* and *translucency*. If *initialColor* has a value of 'As is', *translucency* has no effect. The `setColor` method has the following arguments:

Required arguments

initialColor A string specifying the initial color applied to the objects.

Optional arguments

translucency A float in the range of 0.0 to 1.0 specifying how translucent the objects drawn using *initialColor* needs to be.

Return value
`None.`

Exceptions
None.

setColor(...)

This method specifies the color assignment using attributes specified by an *AttributeColorMap* object. The `setColor` method has the following arguments:

Required arguments

colorMapping An *AttributeColorMap* object. Possible values are any AttributeColorMap object.

Optional arguments
None.

Return value
`None.`

Exceptions
None.

setColor(...)

This method specifies the color of a *Leaf* object.

Required arguments

leaf A *Leaf* object. Possible values are any Leaf object.

Optional arguments
At least one of the following must be provided:

edgeColorWireHide A String specifying the color to be used for drawing the edges of the elements contained in *leaf* when the render style is wireframe or hidden.

edgeColorFillShade A String specifying the color to be used for drawing the edges of the elements contained in *leaf* when the render style is filled or shaded.

fillColor A String specifying the color to be used for drawing the faces of the elements contained in *leaf* when the render style is filled or shaded.

nodeSymbolColor A String specifying the color to be used for drawing the nodes contained in *leaf*.

nodeSymbolType

A SymbolicConstant specifying the node symbol types for the nodes contained in *leaf*. Possible values areFILLED_CIRCLE, FILLED_SQUARE, FILLED_DIAMOND, FILLED_TRI, HOLLOW_CIRCLE, HOLLOW_SQUARE, HOLLOW_DIAMOND, HOLLOW_TRI, CROSS, and XMARKER. The default value is HOLLOW_CIRCLE.

nodeSymbolSize

A SymbolicConstant specifying the node symbol size for the nodes contained in *leaf*. Possible values are SMALL, MEDIUM, and LARGE. The default value is SMALL.

Return value

`None.`

Exceptions

None.

`forceRefresh()`

This method causes the Viewport to refresh immediately. It is provided to allow scripts to refresh the Viewport before the script terminates. Normally, there would only be a single cumulative refresh that takes place immediately after the script completes.

Arguments

None.

Return value

`None.`

Exceptions

None.

`setValues(...)`

This method modifies the Viewport object. The arguments to `setValues` are the same as the arguments to the *`Viewport`* method, except for the *name* argument. In addition, the `setValues` method has the following arguments:

Required arguments

None.

Optional arguments

displayedObject

A Displayable object specifying the object to be displayed. The Displayable type is an abstract generalization. The concrete possible types are *Part*, *Assembly*, *ConstrainedSketch*, *Odb*, *PlyStackPlot*, or *XYPlot*. If *displayedObject*=`None`, Abaqus displays an empty viewport.

displayMode

A SymbolicConstant specifying the display mode of the viewport. Possible values are:

- SINGLE, specifying a single *displayedObject*.

- OVERLAY, specifying one or more layers to be displayed simultaneously—each layer contains one *displayedObject*.

visibleLayers
A sequence of Strings specifying the names of layers that will be displayed in the viewport when *displayMode* = OVERLAY.

viewManipLayers
A SymbolicConstant specifying which layer or layers will be controlled by the view manipulation tools when *displayMode*=OVERLAY. Possible values are ALL and CURRENT.

currentLayer
A String specifying which layer is affected by options settings when *displayMode* =OVERLAY. The current layer is also the only layer affected by view manipulations when*viewManipLayers* =CURRENT.

layerOffset
A Float specifying a factor to be used in offsetting layers in the screen Z direction. Possible values are –1 to 1. A negative value reverses the apparent order in which the layers are plotted.

Return value
`None.`

Exceptions
RangeError.

`addDrawings(...)`

This method identifies the names of *Drawing* objects to be rendered in the Viewport.

Required arguments
None.

Optional arguments
names
A sequence of String values identifying keys in the session.drawings repository.

Return value
`None.`

Exceptions
ValueError.

`removeDrawings(...)`

This method identifies the names of *Drawing* objects to no longer be rendered in the Viewport.

Required arguments
None.

Optional arguments

names
A sequence of String values identifying keys in the Viewport sequence.

Return value

`None.`

Exceptions

ValueError.

`timeDisplay(...)`

This method refreshes the Viewport display *numFrames* times and then checks to see if *numSeconds* seconds have elapsed. If not, it will continue refreshing the Viewport until the time has elapsed. At completion, the actual number of refreshes (frames) rendered and elapsed time will be reported along with the calculated frames-per-second (fps).

Required arguments

None.

Optional arguments

numFrames
An Int specifying the minimum number of times to refresh the Viewport. The default value is 0.

numSeconds
An Int specifying the minimum number of seconds to spend refreshing the Viewport. The default value is 10.

degreesPerFrame
A Float specifying the number of degrees to rotate the model view about its Z axis before each refresh. The default value is 0.0.

Return value

`None.`

Exceptions

None.

Members

The Viewport object has members with the same names and descriptions as the arguments to the *Viewport* method.

In addition, the Viewport object can have the following members:

displayMode
A SymbolicConstant specifying the display mode of the viewport. Possible values are:

- SINGLE, specifying a single *displayedObject*.
- OVERLAY, specifying one or more layers to be displayed simultaneously—each layer contains one *displayedObject*.

viewManipLayers

A SymbolicConstant specifying which layer or layers will be controlled by the view manipulation tools when *displayMode*=OVERLAY. Possible values are ALL and CURRENT.

layerOffset

A Float specifying a factor to be used in offsetting layers in the screen Z direction. Possible values are –1 to 1. A negative value reverses the apparent order in which the layers are plotted.

windowState

A SymbolicConstant specifying the current state of a viewport. Possible values are NORMAL, MAXIMIZED, and MINIMIZED.

currentWidth

A Float specifying the width in millimeters of the current viewport, regardless of the value of *windowState*.

currentHeight

A Float specifying the height in millimeters of the current viewport, regardless of the value of *windowState*, and including the title bar.

applyLinkedCommands

A Boolean specifying whether the viewport is linked for synchronization. The default value is ON.

activeColorModes

A SymbolicConstant specifying the currently active color mappings. Possible values are:

- DEFAULT_COLORS
- PART_GEOM_MAP_COLORS
- ASSEMBLY_MAP_COLORS
- PART_MAP_COLORS
- INSTANCE_MAP_COLORS
- INSTANCE_TYPE_MAP_COLORS
- SECTION_MAP_COLORS
- MATERIAL_MAP_COLORS
- LOAD_MAP_COLORS
- BC_MAP_COLORS
- INTERACTION_MAP_COLORS
- CONSTRAINT_MAP_COLORS
- SET_MAP_COLORS
- SURFACE_MAP_COLORS
- INTERNAL_SET_MAP_COLORS
- INTERNAL_SURFACE_MAP_COLORS
- DISPLAY_GRP_MAP_COLORS
- SELECTION_GRP_MAP_COLORS
- ELTYPE_MAP_COLORS
- PLOT_MAP_COLORS
- MESH_MAP_COLORS

The default value is DEFAULT_COLORS.

colorMode

A SymbolicConstant specifying the last applied color mapping. Possible values are:

- DEFAULT_COLORS
- PART_GEOM_MAP_COLORS
- ASSEMBLY_MAP_COLORS
- PART_MAP_COLORS
- INSTANCE_MAP_COLORS
- INSTANCE_TYPE_MAP_COLORS
- SECTION_MAP_COLORS
- MATERIAL_MAP_COLORS
- LOAD_MAP_COLORS
- BC_MAP_COLORS
- INTERACTION_MAP_COLORS
- CONSTRAINT_MAP_COLORS
- SET_MAP_COLORS
- SURFACE_MAP_COLORS
- INTERNAL_SET_MAP_COLORS
- INTERNAL_SURFACE_MAP_COLORS
- DISPLAY_GRP_MAP_COLORS
- SELECTION_GRP_MAP_COLORS
- ELTYPE_MAP_COLORS
- PLOT_MAP_COLORS
- MESH_MAP_COLORS

The default value is DEFAULT_COLORS.

translucency

A Float specifying the translucency that will be applied to objects colored using *initialColor* and it needs to be set along with *initialColor*. If *initialColor* is set to 'As is' then translucency will have no effect.

animationConnect

A Boolean specifying whether an animation is connected to the viewport.

colorMappings

A repository of *AttributeColorMap* objects specifying the objects cannot be constructed but the following attribute maps are supported:

- "type"
- "Element set"
- "Material"
- "Section"
- "Default"
- "Part"

- "Part instance"
- "Element type"
- "Averaging region"
- "Assembly"
- "Property"
- "Set"
- "Surface"
- "Skin"
- "Profile"
- "Part shape"
- "Part status"
- "Part geometry"
- "Meshability"
- "Instance type"
- "Load"
- "Boundary condition"
- "Interaction"
- "Constraint"
- "Interaction type"
- "Constraint type"
- "Display group"
- "Selection group"
- "Interaction property"
- "Connector"
- "Connector type"
- "Connector property"
- "Internal set"
- "Internal surface"
- "mapColors"
- "autoColors"
- "overrides"
- "defaultAutoColors"
- "defaultOverrides"
- "objectToCopy"
- "colorMapping"
- "colorMappings"
- "colorMode"
- "attributeColors"
- "updateOverrides"

- "colorCodeOverride"
- "initialColor"
- "Layup"
- "Ply"

initialColor

A String specifying the color that will be applied to all objects in the viewport at the start of color coding. The possible values are 'As is', 'Default' or a string with a hexadecimal representation of a color.

currentLayer

A String specifying which layer is affected by options settings when *displayMode* =OVERLAY. The current layer is also the only layer affected by view manipulations when*viewManipLayers* =CURRENT.

displayedObject

A Displayable object specifying the object to be displayed. The Displayable type is an abstract generalization. The concrete possible types are *Part*, *Assembly*, *ConstrainedSketch*, *Odb*, *PlyStackPlot*, or *XYPlot*. If *displayedObject*=`None`, Abaqus displays an empty viewport.

layers

A repository of *Layer* objects specifying the key to the repository is a String with the name of the layer.

view

A *View* object specifying the object that controls viewing of the viewport content.

odbDisplay

An *OdbDisplay* object specifying the display options for the *Odb* object.

partDisplay

A *PartDisplayOptions* object specifying the display options for the *Part* object.

assemblyDisplay

An *AssemblyDisplayOptions* object specifying the display options for the *Assembly* object.

viewportAnnotationOptions

A *ViewportAnnotationOptions* object.

detailPlotOptions

A *DetailPlotOptions* object.

annotationsToPlot

An *AnnotationsToPlotArray* object.

visibleLayers

A tuple of Strings specifying the names of layers that will be displayed in the viewport when *displayMode* = OVERLAY.

currentOrigin

A pair of Floats specifying the *X*- and *Y*-coordinates in millimeters in the canvas coordinate system of the lower left corner of the current viewport, regardless of the value of *windowState*.

iconOrigin

A pair of Floats specifying the *X*- and *Y*-coordinates in millimeters of the lower left corner of the current viewport from a coordinate system having its origin in the lower left corner of the drawing area. This origin refers to the viewport location when *windowState* =MINIMIZED.

lightOptions A *LightOptions* object.

imageOptions An *ImageOptions* object.

movieOptions A *MovieOptions* object.

animationController An *AnimationController* object.

drawings A tuple of Strings specifying keys to the session.drawings repository. The default value is an empty sequence.

ImageOptions object

The ImageOptions object stores settings that control how an image is rendered in a particular viewport. ImageOptions objects are accessed from the image options associated with a particular viewport.

The ImageOptions object has no constructor; Abaqus creates the *imageOptions* member for a viewport when the viewport is created using the values in the *imageOptions* member of the current viewport.

Access

```
session.viewports[name].imageOptions
```

`setValues(...)`

This method modifies the ImageOptions object.

Required arguments

None.

Optional arguments

imageName

A String specifying the name of the image. A list of valid image names is in the *images* repository in the *session* object.

showImage

A Boolean specifying whether an image should be displayed in the viewport background. The default value is OFF.

positionMethod

A SymbolicConstant specifying which positioning method is used to determine how the image will be scaled and positioned in the viewport. Possible values are:

- FIT_TO_VIEWPORT, specifying a display mode where the image is scaled to fit in the viewport using the specified *fitMethod*.
- AUTO_ALIGN, specifying a display mode where the image is scaled as specified by *xScale* and *yScale* and then positioned in the viewport using the specified *alignment*.
- MANUAL, specifying a display mode where the image is scaled as specified by *xScale* and *yScale* and then positioned in the viewport using the specified *origin*.

The default value is FIT_TO_VIEWPORT.

fitMethod

A SymbolicConstant specifying which type of fit is performed to scale and position the image in the viewport when *positionMethod* =FIT_TO_VIEWPORT. Possible values are:

- BEST_FIT, specifying a mode where the image is scaled to completely fit within the viewport.
- FIT_WIDTH, specifying a mode where the image width is scaled to match the viewport width.
- FIT_HEIGHT, specifying a mode where the image height is scaled to match the viewport height.

The default value is BEST_FIT.

alignment A SymbolicConstant specifying the relative position of the image in the viewport when *positionMethod* =AUTO_ALIGN. Possible values are:

- BOTTOM_LEFT
- BOTTOM_CENTER
- BOTTOM_RIGHT
- CENTER_LEFT
- CENTER
- CENTER_RIGHT
- TOP_LEFT
- TOP_CENTER
- TOP_RIGHT

The default value is CENTER.

xScale A Float specifying the scale applied to the image width. The *xScale* argument is ignored when *positionMethod* =FIT_TO_VIEWPORT. The default value is 1.0.

When *xScale* is negative, the image is mirrored about its y-axis but its position is not affected.

yScale A Float specifying the scale applied to the image height. The *yScale* argument is ignored when *positionMethod* =FIT_TO_VIEWPORT. The default value is 1.0.

When *yScale* is negative, the image is mirrored about its x-axis but its position is not affected.

origin A pair of Floats specifying the *X*- and *Y*-offsets in millimeters from the lower-left corner of the viewport. The *origin* argument is ignored unless *positionMethod* =MANUAL. The default value is (0, 0).

translucency A Float specifying the translucency factor to use when displaying the image. Possible values are $0.0 \leq$ *translucency* ≤ 1.0 with 0.0 being invisible and 1.0 being opaque. The default value is 1.0.

options `None` or an ImageOptions object specifying the object from which values are to be copied. If other arguments are also supplied to `setValues`, they will override the values in the *options* member. The default value is `None`.

Return value

`None`.

Exceptions

RangeError.

Members

The ImageOptions object has members with the same names and descriptions as the arguments to the *`setValues`* method.

MovieOptions object

The MovieOptions object stores settings that control how the movie background for an animation is rendered in a particular viewport. MovieOptions objects are accessed from the movie options associated with a particular viewport.

The MovieOptions object has no constructor; Abaqus creates the *movieOptions* member for a viewport when the viewport is created using the values in the *movieOptions* member of the current viewport.

Access

```
session.viewports[name].movieOptions
```

`setValues(...)`

This method modifies the MovieOptions object.

Required arguments

None.

Optional arguments

movieName

A String specifying the name of the movie. A list of valid movie names is in the *movies* repository in the *session* object.

showMovie

A Boolean specifying whether a movie should be displayed in the viewport during an animation. The default value is OFF.

positionMethod

A SymbolicConstant specifying which positioning method is used to determine how the movie frames will be scaled and positioned in the viewport. Possible values are:

- FIT_TO_VIEWPORT, specifying a display mode where the movie frame is scaled to fit in the viewport using the specified *fitMethod*.
- AUTO_ALIGN, specifying a display mode where the movie frame is scaled as specified by *xScale* and *yScale* and then positioned in the viewport using the specified *alignment*.
- MANUAL, specifying a display mode where the movie frame is scaled as specified by *xScale* and *yScale* and then positioned in the viewport using the specified *origin*.

The default value is FIT_TO_VIEWPORT.

fitMethod

A SymbolicConstant specifying which type of fit is performed to scale and position the movie frame in the viewport when *positionMethod* =FIT_TO_VIEWPORT. Possible values are:

- BEST_FIT, specifying a mode where the movie frame is scaled to completely fit within the viewport.
- FIT_WIDTH, specifying a mode where the movie frame width is scaled to match the viewport width.
- FIT_HEIGHT, specifying a mode where the movie frame height is scaled to match the viewport height.

The default value is BEST_FIT.

alignment A SymbolicConstant specifying the relative position of the movie frame in the viewport when *positionMethod* =AUTO_ALIGN. Possible values are:

- BOTTOM_LEFT
- BOTTOM_CENTER
- BOTTOM_RIGHT
- CENTER_LEFT
- CENTER
- CENTER_RIGHT
- TOP_LEFT
- TOP_CENTER
- TOP_RIGHT

The default value is CENTER.

xScale A Float specifying the scale applied to the movie frame width. The *xScale* argument is ignored when *positionMethod* =FIT_TO_VIEWPORT. The default value is 1.0.

When *xScale* is negative, the movie frame is mirrored about its y-axis but its position is not affected.

yScale A Float specifying the scale applied to the movie frame height. The *yScale* argument is ignored when *positionMethod* =FIT_TO_VIEWPORT. The default value is 1.0.

When *yScale* is negative, the movie frame is mirrored about its x-axis but its position is not affected.

origin A pair of Floats specifying the*X*- and *Y*-offsets in millimeters from the lower-left corner of the viewport. The *origin* argument is ignored unless *positionMethod* =MANUAL. The default value is (0, 0).

translucency A Float specifying the translucency factor to use when displaying the movie frame. Possible values are $0.0 \leq$ *translucency* ≤ 1.0 with 0.0 being invisible and 1.0 being opaque. The default value is 1.0.

options `None` or a MovieOptions object specifying the object from which values are to be copied. If other arguments are also supplied to `setValues`, they will override the values in the *options* member. The default value is `None`.

Return value

`None`.

Exceptions

RangeError.

Members

The MovieOptions object has members with the same names and descriptions as the arguments to the *setValues* method.

Highlight commands

The Highlight commands are used to highlight objects in the current viewport and to remove the highlighting.

highlight

This method highlights an object in the current viewport.

Path

highlight

Required arguments

object An object specifying the object in the current viewport to be highlighted. You can specify only a single object. Abaqus/CAE highlights only the edges of a face when highlighting a surface and a face together. The following objects are supported:

For the MDB

- Vertex
- Edge
- Face
- Surface
- Cell
- Node
- Element
- Element face
- Element edge
- Feature
- Datum
- Instance
- Set
- Load
- Boundary condition
- Predefined field
- Display group

For the ODB

- Node
- Element
- Display group

unhighlight

This method removes highlighting from an object in the current viewport.

Path

unhighlight

Required arguments

object

An object specifying the object in the current viewport from which the highlighting will be removed. You can specify only a single object. See *highlight* for a list of supported objects.

Connector commands

A connector describes the relative motions between two points. A connector also describes the behavior associated with the relative motion.

In this section:

- *ConnectorBehaviorOption object*
- *CDCTerm object*
- *ConnectorDamage object*
- *ConnectorDamping object*
- *ConnectorElasticity object*
- *ConnectorFailure object*
- *ConnectorFriction object*
- *ConnectorLock object*
- *ConnectorOptions object*
- *ConnectorPlasticity object*
- *ConnectorPotential object*
- *ConnectorStop object*
- *DerivedComponent object*
- *TangentialBehavior object*

ConnectorBehaviorOption object

The ConnectorBehaviorOption object is the abstract base type for other ConnectorBehaviorOption objects. The ConnectorBehaviorOption object has no explicit constructor. The members of the ConnectorBehaviorOption object are common to all objects derived from the ConnectorBehaviorOption.

Access

```
import section
mdb.models[name].sections[name].behaviorOptions[i]
import odbSection
session.odbs[name].sections[name].behaviorOptions[i]
```

Members

The ConnectorBehaviorOption object has no members.

CDCTerm object

The CDCTerm object is used to create contributing terms for a *DerivedComponent* object.

Access

```
import section
mdb.models[name].sections[name].behaviorOptions[i]\
.connectorPotentials[i].derivedComponent.cdcTerms[i]
mdb.models[name].sections[name].behaviorOptions[i].derivedComponent\
.cdcTerms[i]
mdb.models[name].sections[name].behaviorOptions[i]\
.evolutionPotentials[i].derivedComponent.cdcTerms[i]
mdb.models[name].sections[name].behaviorOptions[i]\
.initiationPotentials[i].derivedComponent.cdcTerms[i]
import odbSection
session.odbs[name].sections[name].behaviorOptions[i]\
.connectorPotentials[i].derivedComponent.cdcTerms[i]
session.odbs[name].sections[name].behaviorOptions[i].derivedComponent\
.cdcTerms[i]
session.odbs[name].sections[name].behaviorOptions[i]\
.evolutionPotentials[i].derivedComponent.cdcTerms[i]
session.odbs[name].sections[name].behaviorOptions[i]\
.initiationPotentials[i].derivedComponent.cdcTerms[i]
```

CDCTerm(...)

This method creates a CDCTerm object.

Path

```
mdb.models[name].sections[name].behaviorOptions[i]\
.connectorPotentials[i].derivedComponent.CDCTerm
mdb.models[name].sections[name].behaviorOptions[i].derivedComponent\
.CDCTerm
mdb.models[name].sections[name].behaviorOptions[i]\
.evolutionPotentials[i].derivedComponent.CDCTerm
mdb.models[name].sections[name].behaviorOptions[i]\
.initiationPotentials[i].derivedComponent.CDCTerm
session.odbs[name].sections[name].behaviorOptions[i]\
.connectorPotentials[i].derivedComponent.CDCTerm
session.odbs[name].sections[name].behaviorOptions[i].derivedComponent\
.CDCTerm
session.odbs[name].sections[name].behaviorOptions[i]\
.evolutionPotentials[i].derivedComponent.CDCTerm
session.odbs[name].sections[name].behaviorOptions[i]\
.initiationPotentials[i].derivedComponent.CDCTerm
```

Required arguments

intrinsicComponents A sequence of Ints specifying the components of relative motion for which the contributing term is defined. Possible values are $1 \leq intrinsicComponents \leq 6$. Only available components can be specified if the DerivedComponent object is being referenced by a Potential object. This

is not the case if the DerivedComponent object is referenced by a ConnectorFriction object directly. The default value is an empty sequence.

table

A sequence of sequences of Floats specifying components numbers and temperature and field values. Each sequence of the table data specifies:

- The first intrinsic component number.
- If applicable, the second intrinsic component number.
- Etc.
- If applicable, the first independent component number.
- If applicable, the second independent component number.
- Etc.
- If applicable, the temperature value.
- If applicable, the value of the first field variable.
- If applicable, the value of the second field variable.
- Etc.

The default value is an empty sequence.

Optional arguments

termOperator

A SymbolicConstant specifying the method for combining contributing terms: square root of a sum of the squares, direct sum, or Macauley sum. Possible values are RSS, SUM, and MACAULEY. The default value is RSS.

termSign

A SymbolicConstant specifying the overall sign for the contributing term. Possible values are POSITIVE and NEGATIVE. The default value is POSITIVE.

localDependency

A Boolean specifying whether the table data depend on either components of relative position or components of constitutive relative motion. The default value is OFF.

indepCompType

A SymbolicConstant specifying whether localDependency refers to components of relative position or components of constitutive relative motion. Possible values are POSITION and MOTION. The default value is POSITION.

The *indepCompType* argument applies only if *localDependency*=ON.

indepComponents

A sequence of Ints specifying the independent components included in the derived component definition. Possible values are $1 \leq$*indepComponents*≤ 6. Only available components can be specified. The *indepComponents* argument applies only if *localDependency*=ON. The default value is an empty sequence.

tempDependency

A Boolean specifying whether the table data depend on temperature. The default value is OFF.

fieldDependencies

An Int specifying the number of field variable dependencies. The default value is 0.

Return value

A CDCTerm object.

Exceptions

ValueError and TextError.

`setValues(...)`

This method modifies the CDCTerm object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *CDCTerm* method.

Return value

`None.`

Exceptions

ValueError.

Members

The CDCTerm object has members with the same names and descriptions as the arguments to the *CDCTerm* method.

In addition, the CDCTerm object can have the following member:

options
A *ConnectorOptions* object specifying the *ConnectorOptions* used to define tabular options for this *ConnectorBehaviorOption*.

ConnectorDamage object

The ConnectorDamage object defines damage behavior for one or more components of a connector's relative motion.

The ConnectorDamage object is derived from the *ConnectorBehaviorOption* object.

Access

```
import section
mdb.models[name].sections[name].behaviorOptions[i]
import odbSection
session.odbs[name].sections[name].behaviorOptions[i]
```

ConnectorDamage(...)

This method creates a connector damage behavior option for a *ConnectorSection* object.

Path

```
import connectorBehavior
connectorBehavior.ConnectorDamage
import odbConnectorBehavior
odbConnectorBehavior.ConnectorDamage
```

Required arguments

None.

Optional arguments

coupling

A SymbolicConstant specifying whether or not the behavior is coupled. Possible values are UNCOUPLED and COUPLED. The default value is UNCOUPLED.

criterion

A SymbolicConstant specifying the damage initiation criterion to be used. Possible values are FORCE, MOTION, and PLASTIC_MOTION. The default value is FORCE.

initiationTemperature

A Boolean specifying whether the initiation data depend on temperature. The default value is OFF.

initiationPotentialOperator

A SymbolicConstant specifying the contribution operator for the initiation potential contributions. Possible values are SUM and MAXIMUM. The default value is SUM.

This argument is only if *coupling*=COUPLED and if *criterion*=FORCE or MOTION.

initiationPotentialExponent

A Float specifying the number equal to the inverse of the overall exponent in the initiation potential definition. The default value is 2.0.

This argument is applicable only if *coupling*=COUPLED, when *initiationPotentialOperator*=SUM, and when *criterion*=FORCE or MOTION.

initiationDependencies

An Int specifying the number of field variable dependencies for the initiation data. The default value is 0.

evolution

A Boolean specifying whether damage evolution data will be used. The default value is ON.

evolutionType

A SymbolicConstant specifying the type of damage evolution to be specified. Possible values are MOTION_TYPE and ENERGY_TYPE. The default value is MOTION_TYPE.

This argument is applicable only if *evolution*=ON.

softening

A SymbolicConstant specifying the damage evolution law to be specified. Possible values are LINEAR, EXPONENTIAL, and TABULAR. The default value is LINEAR.

This argument is applicable only if *evolution*=ON and when *evolutionType*=MOTION_TYPE.

useAffected

A Boolean specifying whether or not *affectedComponents* will be specified. If *useAffected*=OFF, then only the components of relative motion specified by *components* will undergo damage. The default value is OFF.

This argument is applicable only if *evolution*=ON.

degradation

A SymbolicConstant specifying the contribution of each damage mechanism when more than one damage mechanism is defined. Possible values are MAXIMUM and MULTIPLICATIVE. The default value is MAXIMUM.

This argument is applicable if *evolution*=ON.

evolutionTemperature

A Boolean specifying whether the evolution data depend on temperature. The default value is OFF.

This argument is applicable only if *evolution*=ON.

evolutionDependencies

An Int specifying the number of field variable dependencies for the evolution data. The default value is 0.

This argument is applicable only if *evolution*=ON.

evolutionPotentialOperator

A SymbolicConstant specifying the contribution operator for the evolution potential contributions. Possible values are SUM and MAXIMUM. The default value is SUM.

This argument is applicable only if *coupling*=COUPLED, when *evolution*=ON, when *evolutionType*=MOTION_TYPE, and when *criterion*=FORCE or MOTION.

evolutionPotentialExponent

A Float specifying the number equal to the inverse of the overall exponent in the evolution potential definition. The default value is 2.0.

This argument is applicable only if *coupling*=COUPLED, when *evolution*=ON, when *evolutionPotentialOperator*=SUM, when *evolutionType*=MOTION, and when *criterion*=FORCE or MOTION.

initiationPotentials

A *ConnectorPotentialArray* object specifying one *ConnectorPotential* object for each initiation potential contribution. This member can be specified only if *coupling*=COUPLED and if *criterion*=FORCE or MOTION.

evolutionPotentials

A *ConnectorPotentialArray* object specifying one *ConnectorPotential* object for each evolution potential contribution). This member can be specified only if *coupling*=COUPLED, if *evolution*=ON, if *evolutionType*=MOTION, and if *criterion*=FORCE or MOTION.

initiationTable

A sequence of sequences of Floats specifying the initiation properties. The default value is an empty sequence.

Items in the *initiationTable* data are described below.

evolutionTable

A sequence of sequences of Floats specifying the evolution properties. The default value is an empty sequence.

Items in the *evolutionTable* data are described below. This argument is only applicable if *evolution*=ON.

affectedComponents

A sequence of Ints specifying the components of relative motion that will be damaged. Possible values are $1 \leq components \leq 6$. Only available components can be specified. This argument is applicable only if *evolution*=ON and *useAffected*=ON. The default value is an empty sequence.

components

A sequence of Ints specifying the components of relative motion for which the behavior is defined. Possible values are $1 \leq components \leq 6$. Only available components can be specified. This argument can be specified only if *coupling*=UNCOUPLED. The default value is an empty sequence.

Table data

Table data for *initiationTable*:

If *criterion*=FORCE, then each sequence of the table data specifies the following:

- Lower (compression) limiting force or moment. Use -1.0E+36 to indicate an unspecified lower limit.
- Upper (tension) limiting force or moment. Use 1.0E+36 to indicate an unspecified upper limit. At least one limit, lower or upper, must be specified.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *criterion*=MOTION, then each sequence of the table data specifies the following:

- Lower (compression) limiting connector constitutive relative displacement or rotation. Use -1.0E+36 to indicate an unspecified lower limit.
- Upper (tension) limiting connector constitutive relative displacement or rotation. Use 1.0E+36 to indicate an unspecified upper limit. At least one limit, lower or upper, must be specified.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *criterion*=PLASTIC_MOTION, then each sequence of the table data specifies the following:

- Relative equivalent plastic displacement/rotation at which damage will be initiated.
- Mode mix ratio (only if *coupling*=COUPLED).
- Relative equivalent plastic displacement/rotation rate.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Table data for *evolutionTable*:

If *evolutionType*=MOTION and *softening*=LINEAR, then each sequence of the table data specifies the following:

- Post-initiation equivalent relative plastic motion at ultimate failure if *criterion*=PLASTIC_MOTION. Otherwise, post-initiation constitutive relative motion (displacement/rotation) at ultimate failure.
- Mode mix ratio (only if *coupling*=COUPLED and *criterion*=PLASTIC_MOTION).
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *evolutionType*=MOTION and *softening*=EXPONENTIAL, then each sequence of the table data specifies the following:

- Post-initiation equivalent relative plastic motion at ultimate failure if *criterion*=PLASTIC_MOTION. Otherwise, post-initiation constitutive relative motion (displacement/rotation) at ultimate failure.
- Exponential law parameter.
- Mode mix ratio (only if *coupling*=COUPLED and *criterion*=PLASTIC_MOTION).
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *evolutionType*=MOTION and *softening*=TABULAR, then each sequence of the table data specifies the following:

- Damage variable (cannot be less than 0 or greater than 1).
- Post-initiation equivalent relative plastic motion if *criterion*=PLASTIC_MOTION. Otherwise, post-initiation constitutive relative motion (displacement/rotation).
- Mode mix ratio (only if *coupling*=COUPLED and *criterion*=PLASTIC_MOTION).
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *evolutionType*=ENERGY, then each sequence of the table data specifies the following:

- Total energy dissipated by damage at ultimate failure.
- Mode mix ratio (only if *coupling*=COUPLED and *criterion*=PLASTIC_MOTION).

- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A ConnectorDamage object.

Exceptions

ValueError and TextError.

`setValues(...)`

This method modifies the ConnectorDamage object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConnectorDamage* method.

Return value

`None.`

Exceptions

ValueError.

Members

The ConnectorDamage object has members with the same names and descriptions as the arguments to the *ConnectorDamage* method.

In addition, the ConnectorDamage object can have the following members:

initiationOptions

A *ConnectorOptions* object specifying the *ConnectorOptions* used to define tabular options for the damage initiation table.

evolutionOptions

A *ConnectorOptions* object specifying the *ConnectorOptions* used to define tabular options for the damage evolution table.

Corresponding analysis keywords

- **CONNECTOR DAMAGE INITIATION*, **CONNECTOR DAMAGE EVOLUTION*, **CONNECTOR POTENTIAL*

ConnectorDamping object

The ConnectorDamping object defines damping behavior for one or more components of a connector's relative motion.

The ConnectorDamping object is derived from the *ConnectorBehaviorOption* object.

Access

```
import section
mdb.models[name].sections[name].behaviorOptions[i]
import odbSection
session.odbs[name].sections[name].behaviorOptions[i]
```

ConnectorDamping(...)

This method creates a connector damping behavior option for a *ConnectorSection* object.

Path

```
import connectorBehavior
connectorBehavior.ConnectorDamping
import odbConnectorBehavior
odbConnectorBehavior.ConnectorDamping
```

Required arguments

None.

Optional arguments

type

A SymbolicConstant specifying if the damping type is viscous or structural. Possible values are VISCOUS and STRUCTURAL. The default value is VISCOUS.

behavior

A SymbolicConstant specifying if the damping behavior is linear or nonlinear. If *type*=VISCOUS, possible values are LINEAR and NONLINEAR. If *type*=STRUCTURAL, the possible value is LINEAR.

coupling

A SymbolicConstant specifying whether the damping behavior is coupled between the connector's components of relative motion. If *behavior*=LINEAR, possible values are UNCOUPLED and COUPLED. If *behavior*=NONLINEAR, possible values are UNCOUPLED, COUPLED_POSITION, and COUPLED_MOTION. Possible values are UNCOUPLED, COUPLED, COUPLED_POSITION, and COUPLED_MOTION. The default value is UNCOUPLED.

dependencies

An Int specifying the number of field variable dependencies. The default value is 0. This argument is applicable only if *type*=VISCOUS.

temperatureDependency

A Boolean specifying whether the behavior data depend on temperature. The default value is OFF. This argument is applicable only if *type*=VISCOUS.

frequencyDependency A Boolean specifying whether the behavior data depend on frequency. This value is applicable only if *behavior*= LINEAR and *coupling*=UNCOUPLED. The default value is OFF.

table A sequence of sequences of Floats specifying damping properties. Items in the table data are described below. The default value is an empty sequence.

independentComponents A sequence of Ints specifying the list of independent components that are included in the definition of the connector damping data. This argument is applicable only if *behavior*=NONLINEAR and *coupling*=COUPLED_POSITION or COUPLED_MOTION. When this argument is applicable, at least one value must be specified. Only available components can be specified. The default value is an empty sequence.

components A sequence of Ints specifying the components of relative motion for which the behavior is defined. Possible values are $1 \leq components \leq 6$. Only available components can be specified. The default value is an empty sequence.

Table data

If *type*=VISCOUS, *behavior*=LINEAR, and *coupling*=UNCOUPLED, each sequence of the table data specifies the following:

- Damping coefficient (force or moment per relative velocity).
- Frequency (cycles/time), if the data depend on frequency.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=VISCOUS, *behavior*=NONLINEAR, and *coupling*=UNCOUPLED, each sequence of the table data specifies the following:

- Force or moment.
- Relative displacement or rotation.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=VISCOUS, *behavior*=LINEAR, and *coupling*=COUPLED, the table data specify the symmetric portion of the damping matrix for the specified components followed by any temperature data and then any field data. For example, if components 2, 3, and 5 are specified, the table portion of the command is as follows:

```
table=( (C22, C23, C25, C33, C35, C55,), )
```

The following items should be specified as comma-separated data:

- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.

- Value of the second field variable.
- Etc.

If *type*=VISCOUS, *behavior*=NONLINEAR, and *coupling*=COUPLED_POSITION or COUPLED_MOTION, each sequence of the table data specifies the following:

- Force or moment for the directions in the *components* list.
- Relative velocity for the directions in the *components* list.
- Relative position or angle for the first *independentComponents* direction if *coupling*=COUPLED_POSITION. Relative displacement or rotation for the first *independentComponents* direction if *coupling*=COUPLED_MOTION.
- Relative position or angle for the second *independentComponents* direction if *coupling*=COUPLED_POSITION. Relative displacement or rotation for the second *independentComponents* direction if *coupling*=COUPLED_MOTION.
- Etc. up to the Nth *independentComponents* direction.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=STRUCTURAL, *behavior*=LINEAR, and *coupling*=UNCOUPLED, each sequence of the table data specifies the following:

- Damping coefficient (force or moment per relative velocity).
- Frequency (cycles/time), if the data depend on frequency.
- Etc.

If *type*=STRUCTURAL, *behavior*=LINEAR, and *coupling*=COUPLED, the table data specify the symmetric portion of the damping matrix for the specified components. For example, if components 2, 3, and 5 are specified, the table portion of the command is as follows:

```
table=( (S22, S23, S25, S33, S35, S55,), )
```

Return value

A ConnectorDamping object.

Exceptions

ValueError and TextError.

setValues(...)

This method modifies the ConnectorDamping object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConnectorDamping* method.

Return value
`None.`

Exceptions
ValueError.

Members
The ConnectorDamping object has members with the same names and descriptions as the arguments to the *ConnectorDamping* method.

In addition, the ConnectorDamping object can have the following member:

options
A *ConnectorOptions* object specifying the *ConnectorOptions* used to define tabular options for this *ConnectorBehaviorOption*.

Corresponding analysis keywords
- **CONNECTOR DAMPING*

ConnectorElasticity object

The ConnectorElasticity object defines elastic behavior for one or more components of a connector's relative motion.

The ConnectorElasticity object is derived from the *ConnectorBehaviorOption* object.

Access

```
import section
mdb.models[name].sections[name].behaviorOptions[i]
import odbSection
session.odbs[name].sections[name].behaviorOptions[i]
```

ConnectorElasticity(...)

This method creates a connector elasticity behavior option for a *ConnectorSection* object.

Path

```
import connectorBehavior
connectorBehavior.ConnectorElasticity
import odbConnectorBehavior
odbConnectorBehavior.ConnectorElasticity
```

Required arguments

None.

Optional arguments

behavior

A SymbolicConstant specifying whether the elastic behavior is linear, nonlinear, or rigid. Possible values are LINEAR, NONLINEAR, and RIGID. The default value is LINEAR.

coupling

A SymbolicConstant specifying whether the elastic behavior is coupled between the connector's components of relative motion. If *behavior*=LINEAR, then possible values are UNCOUPLED and COUPLED. If *behavior*=NONLINEAR, then possible values are UNCOUPLED, COUPLED_POSITION, and COUPLED_MOTION. Possible values are UNCOUPLED, COUPLED, COUPLED_POSITION, and COUPLED_MOTION. The default value is UNCOUPLED.

This argument is not applicable if *behavior*=RIGID.

dependencies

An Int specifying the number of field variable dependencies. The default value is 0.

This argument is not applicable if *behavior*=RIGID.

temperatureDependency

A Boolean specifying whether the behavior data depend on temperature. The default value is OFF.

This argument is not applicable if *behavior*=RIGID.

frequencyDependency A Boolean specifying whether the behavior data depend on frequency. This value is applicable only if *behavior*=LINEAR and *coupling*=UNCOUPLED. The default value is OFF.

This argument is not applicable if *behavior*=RIGID.

table A sequence of sequences of Floats specifying elasticity properties. Items in the table data are described below. This argument is not applicable if *behavior*=RIGID. The default value is an empty sequence.

independentComponents A sequence of Ints specifying the list of independent components that are included in the definition of the connector elasticity data. This argument is applicable only if *behavior*=NONLINEAR and *coupling*=COUPLED_POSITION or COUPLED_MOTION. If this argument is applicable, at least one value must be specified. Only available components can be specified. The default value is an empty sequence.

components A sequence of Ints specifying the components of relative motion for which the behavior is defined. Possible values are $1 \leq components \leq 6$. Only available components can be specified. The default value is an empty sequence.

Table data

If *behavior*=LINEAR and *coupling*=UNCOUPLED, then each sequence of the table data specifies the following:

- Elastic stiffness (per each specified force/moment component).
- Frequency (cycles/time), if the data depend on frequency.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *behavior*=NONLINEAR and *coupling*=UNCOUPLED, then each sequence of the table data specifies the following:

- Force or moment.
- Relative displacement or rotation.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *behavior*=LINEAR and *coupling*=COUPLED, the table data specify the symmetric portion of the elastic stiffness matrix for the specified components followed by any temperature data and then any field data. For example, if components 2, 3, and 5 are specified, the table portion of the command is as follows:

```
table=( (D22, D23, D25, D33, D35, D55,),
)
```

The following items should then be specified as comma-separated data:

- Temperature, if the data depend on temperature.

- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *behavior*=NONLINEAR and *coupling*=COUPLED_POSITION or COUPLED_MOTION, each sequence of the table data specifies the following:

- Force or moment for the directions in the *components* list.
- Relative position or angle for the first *independentComponents* direction if *coupling*=COUPLED_POSITION. Relative displacement or rotation for the first *independentComponents* direction if *coupling*=COUPLED_MOTION.
- Relative position or angle for the second *independentComponents* direction if *coupling*=COUPLED_POSITION. Relative displacement or rotation for the second *independentComponents* direction if *coupling*=COUPLED_MOTION.
- Etc. up to the Nth *independentComponents* direction.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A ConnectorElasticity object.

Exceptions

ValueError and TextError.

`setValues(...)`

This method modifies the ConnectorElasticity object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConnectorElasticity* method.

Return value

`None.`

Exceptions

ValueError.

Members

The ConnectorElasticity object has members with the same names and descriptions as the arguments to the *ConnectorElasticity* method.

In addition, the ConnectorElasticity object can have the following member:

options

A *ConnectorOptions* object specifying the *ConnectorOptions* used to define tabular options for this *ConnectorBehaviorOption*.

Corresponding analysis keywords

- **CONNECTOR ELASTICITY*

ConnectorFailure object

The ConnectorFailure object defines failure criteria for one or more components of a connector's relative motion.

The ConnectorFailure object is derived from the *ConnectorBehaviorOption* object.

Access

```
import section
mdb.models[name].sections[name].behaviorOptions[i]
import odbSection
session.odbs[name].sections[name].behaviorOptions[i]
```

ConnectorFailure(...)

This method creates a connector failure behavior option for a *ConnectorSection* object.

Path

```
import connectorBehavior
connectorBehavior.ConnectorFailure
import odbConnectorBehavior
odbConnectorBehavior.ConnectorFailure
```

Required arguments

None.

Optional arguments

releaseComponent

The SymbolicConstant ALL or an Int specifying the motion components that fail. If an Int is specified, only that motion component fails when the failure criteria are satisfied. If *releaseComponent*=ALL, all motion components fail. The default value is ALL.

minMotion

`None` or a Float specifying the lower bound for the connector's relative position for all specified components, or no lower bound. The default value is `None`.

maxMotion

`None` or a Float specifying the upper bound for the connector's relative position for all specified components, or no upper bound. The default value is `None`.

minForce

`None` or a Float specifying the lower bound of the force or moment in the directions of the specified components at which locking occurs, or no lower bound. The default value is `None`.

maxForce

`None` or a Float specifying the upper bound of the force or moment in the directions of the specified components at which locking occurs, or no upper bound. The default value is `None`.

components

A sequence of Ints specifying the components of relative motion for which the behavior is defined. Possible values are $1 \leq components \leq 6$. Only available components can be specified. The default value is an empty sequence.

Return value

A ConnectorFailure object.

Exceptions

ValueError and TextError.

setValues(...)

This method modifies the ConnectorFailure object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConnectorFailure* method.

Return value

`None.`

Exceptions

ValueError.

Members

The ConnectorFailure object has members with the same names and descriptions as the arguments to the *ConnectorFailure* method.

Corresponding analysis keywords

- **CONNECTOR FAILURE*

ConnectorFriction object

The ConnectorFriction object defines Coulomb-like or hysteretic friction behavior for one or more components of a connector's relative motion.

The ConnectorFriction object is derived from the *ConnectorBehaviorOption* object.

Access

```
import section
mdb.models[name].sections[name].behaviorOptions[i]
import odbSection
session.odbs[name].sections[name].behaviorOptions[i]
```

ConnectorFriction(...)

This method creates a connector friction behavior option for a *ConnectorSection* object. Depending upon the arguments provided, the friction behavior can be Coulomb-like or hysteretic in nature.

Path

```
import connectorBehavior
connectorBehavior.ConnectorFriction
import odbConnectorBehavior
odbConnectorBehavior.ConnectorFriction
```

Required arguments

None.

Optional arguments

frictionModel

A SymbolicConstant specifying the desired frictional response model. Possible values are PREDEFINED and USER_CUSTOMIZED. The default value is PREDEFINED.

slipStyle

A SymbolicConstant specifying the method of indicating the slip direction: either specified or computed based upon the force potential data. Possible values are SPECIFY and COMPUTE. The default value is SPECIFY.

This argument is applicable only if *frictionModel*=USER_CUSTOMIZED.

tangentDirection

`None` or an Int specifying the direction for which the frictional behavior is specified. Possible values are $1 \leq$*tangentDirection*≤ 6, indicating an available component of relative motion. This argument applies only if *frictionModel*=USER_CUSTOMIZED and if *slipStyle*=SPECIFY. The default value is `None`.

stickStiffness

`None` or a Float specifying the stick stiffness associated with the frictional behavior in the direction specified by *tangentDirection*. If this argument is omitted, Abaqus computes an appropriate number for the stick stiffness. The default value is `None`.

componentType

A SymbolicConstant specifying the type of the *independentComponents*. Possible values are POSITION, MOTION, and NO_INDEPENDENT_COMPONENTS. The default value is NO_INDEPENDENT_COMPONENTS.

slipDependency

A Boolean specifying whether the table data depend on accumulated slip. The default value is OFF.

This argument applies only if *frictionModel*=USER_CUSTOMIZED.

temperatureDependency

A Boolean specifying whether the table data depend on temperature. The default value is OFF.

This argument applies only if *frictionModel*=USER_CUSTOMIZED.

dependencies

An Int specifying the number of field variable dependencies. The default value is 0.

This argument applies only if *frictionModel*=USER_CUSTOMIZED.

useContactForceComponent

A Boolean specifying whether the contact force component will be defined. The default value is OFF.

This argument applies only if *frictionModel*=USER_CUSTOMIZED.

contactForceStyle

A SymbolicConstant specifying the method of indicating the contact force component direction: either specified or computed based on upon a DerivedComponent. Possible values are COMPONENT_NUMBER and DERIVED_COMPONENT. The default value is COMPONENT_NUMBER.

This argument is applicable only if *frictionModel*=USER_CUSTOMIZED and if *useContactForceComponent*=ON.

contactForceComponent

An Int specifying the contact force component direction. This argument applies only if *frictionModel*=USER_CUSTOMIZED, if *useContactForceComponent*=ON, and if *contactForceStyle*=COMPONENT_NUMBER. The default value is 0.

forcePotentialOperator

A SymbolicConstant specifying the contribution operator for the force potential contributions. Possible values are SUM and MAXIMUM. The default value is SUM.

This argument is applicable only if *frictionModel*=USER_CUSTOMIZED and if *slipStyle*=COMPUTE.

forcePotentialExponent

A Float specifying the number equal to the inverse of the overall exponent in the force potential definition. The default value is 2.0.

This argument is applicable only if *frictionModel*=USER_CUSTOMIZED, if *slipStyle*=COMPUTE, and if *forcePotentialOperator*=SUM.

connectorPotentials

A *ConnectorPotentialArray* object specifying one *ConnectorPotential* object for each force potential contribution. This member can be specified only if *frictionModel*=USER_CUSTOMIZED, and if *slipStyle*=COMPUTE.

table

A sequence of sequences of Floats specifying friction properties. The default value is an empty sequence.

If *frictionModel*=PREDEFINED, each sequence of the table data specifies:

- If applicable, the first geometric scaling constant relevant to frictional interactions.
- Etc., up to as many geometric scaling constants as are associated with this connection type.
- Internal contact force/moment generating friction in the first predefined slip direction.
- If applicable, internal contact force/moment generating friction in the second predefined slip direction.
- Connector constitutive relative motion in the direction specified by *independentComponent*.
- Accumulated slip in the first predefined slip direction, if the data depend on accumulated slip.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *frictionModel*=USER_CUSTOMIZED, each sequence of the table data specifies:

- Effective radius of the cylindrical or spherical surface over which frictional slip occurs in the connector associated with frictional effects in the direction specified by *tangentDirection*. This radius is relevant only if the connection type includes an available rotational component of relative motion and *tangentDirection*=SLIP_DIRECTION.
- Internal contact force/moment generating friction in the direction specified by *tangentDirection*.
- Connector constitutive relative motion in the direction specified by *independentComponent*.
- Accumulated slip in the direction specified by *tangentDirection*, if the data depend on accumulated slip.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

independentComponents

A sequence of Ints specifying the independent components. Possible values are 1 $\leq$ *independentComponents* $\leq$ 6. In addition, each independent component value must be unique. The *independentComponents* argument applies only if *frictionModel*=USER_CUSTOMIZED. Only available components can be specified. The default value is an empty sequence.

Return value

A ConnectorFriction object.

Exceptions

ValueError and TextError.

setValues(...)

This method modifies the ConnectorFriction object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConnectorFriction* method.

Return value

`None.`

Exceptions

ValueError.

Members

The ConnectorFriction object has members with the same names and descriptions as the arguments to the *ConnectorFriction* method.

In addition, the ConnectorFriction object can have the following members:

tangentialBehavior
A *TangentialBehavior* object.

derivedComponent
A *DerivedComponent* object specifying the *DerivedComponent* used to compute the contact force component direction. This argument applies only if *frictionModel*=USER_CUSTOMIZED, if *useContactForceComponent*=ON, and if *contactForceStyle*=DERIVED_COMPONENT.

options
A *ConnectorOptions* object specifying the *ConnectorOptions* used to define tabular options for this *ConnectorBehaviorOption*.

Corresponding analysis keywords

- **CONNECTOR FRICTION*, **FRICTION*, **CONNECTOR POTENTIAL*, **CONNECTOR DERIVED COMPONENT*

ConnectorLock object

The ConnectorLock object defines locking criteria for one or more available components of a connector's relative motion.

The ConnectorLock object is derived from the *ConnectorBehaviorOption* object.

Access

```
import section
mdb.models[name].sections[name].behaviorOptions[i]
import odbSection
session.odbs[name].sections[name].behaviorOptions[i]
```

ConnectorLock(...)

This method creates a connector lock behavior option for a *ConnectorSection*.

Path

```
import connectorBehavior
connectorBehavior.ConnectorLock
import odbConnectorBehavior
odbConnectorBehavior.ConnectorLock
```

Required arguments

None.

Optional arguments

lockingComponent

The SymbolicConstant ALL or an Int specifying the motion components that are locked. If an Int is specified, only that motion component is locked when the locking criteria are satisfied. If *lockingComponent*=ALL, all motion components are locked. The default value is ALL.

minMotion

`None` or a Float specifying the lower bound for the connector's relative position for all specified components, or no lower bound. The default value is `None`.

maxMotion

`None` or a Float specifying the upper bound for the connector's relative position for all specified components, or no upper bound. The default value is `None`.

minForce

`None` or a Float specifying the lower bound of the force or moment in the directions of the specified components at which locking occurs, or no lower bound. The default value is `None`.

maxForce

`None` or a Float specifying the upper bound of the force or moment in the directions of the specified components at which locking occurs, or no upper bound. The default value is `None`.

components

A sequence of Ints specifying the components of relative motion for which the behavior is defined. Possible values are $1 \leq components \leq 6$. Only available components can be specified. The default value is an empty sequence.

Return value

A ConnectorLock object.

Exceptions

ValueError and TextError.

setValues(...)

This method modifies the ConnectorLock object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConnectorLock* method.

Return value

`None.`

Exceptions

ValueError.

Members

The ConnectorLock object has members with the same names and descriptions as the arguments to the *ConnectorLock* method.

Corresponding analysis keywords

**CONNECTOR LOCK*

ConnectorOptions object

The ConnectorOptions object is used to define various options for connector behaviors. It can be used only in conjunction with *CDCTerm*, *ConnectorDamage*, *ConnectorDamping*, *ConnectorElasticity*, *ConnectorFriction*, and *ConnectorPlasticity* objects. Because the *ConnectorDamage* object contains two separate ConnectorOptions repositories (one for damage initiation and one for damage evolution), there are two ConnectorOptions constructors associated with that behavior—initiationOptions and evolutionOptions. The *ConnectorPlasticity* object also contains two separate ConnectorOptions repositories (one for isotropic hardening and one for kinematic hardening), so there are two ConnectorOptions constructors associated with that behavior—isotropicOptions and kinematicOptions.

```

Required arguments

None.

Optional arguments

useBehRegSettings

A Boolean specifying whether or not to use the behavior-level settings for regularization options. This argument is applicable only for an Abaqus/Explicit analysis. The default value is ON.

regularize

A Boolean specifying whether or not the tabular data will be regularized. This argument is applicable only for an Abaqus/Explicit analysis and only if *useBehRegSettings*=OFF. The default value is ON.

defaultTolerance

A Boolean specifying whether or not the analysis default regularization tolerance will be used. This argument is applicable only for an Abaqus/Explicit analysis and only if *useBehRegSettings*=OFF and *regularize*=ON. The default value is ON.

regularization

A Float specifying the regularization increment to be used. This argument is applicable only for an Abaqus/Explicit analysis and only if *useBehRegSettings*=OFF, *regularize*=ON, and *defaultTolerance*=OFF. The default value is 0.03.

defaultRateFactor

A Boolean specifying whether or not the analysis default rate filter factor will be used. This argument is applicable only for an Abaqus/Explicit analysis that includes isotropic hardening with tabular definition or damage initiation with plastic motion criteria. The default value is ON.

rateFactor

A Float specifying the rate filter factor to be used. This argument is applicable only for an Abaqus/Explicit analysis that includes isotropic hardening with tabular definition or damage initiation with plastic motion criteria. This argument is also applicable only if *defaultRateFactor*=OFF. The default value is 0.9.

interpolation

A SymbolicConstant specifying the type of interpolation increment to be used on rate-dependent tabular data. This argument is applicable only for an Abaqus/Explicit analysis that includes isotropic hardening with tabular definition or damage initiation with plastic

motion criteria. Possible values are LINEAR and LOGARITHMIC. The default value is LINEAR.

useBehExtSettings
A Boolean specifying whether or not to use the behavior-level settings for extrapolation options. The default value is ON.

extrapolation
A SymbolicConstant specifying the extrapolation technique to be used. This argument is applicable only if *useBehExtSettings*=OFF. Possible values are CONSTANT and LINEAR. The default value is CONSTANT.

Return value

A ConnectorOptions object.

Exceptions

ValueError and TextError.

`setValues(...)`

This method modifies the ConnectorOptions object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConnectorOptions* method.

Return value

`None.`

Exceptions

ValueError.

Members

The ConnectorOptions object has members with the same names and descriptions as the arguments to the *ConnectorOptions* method.

Corresponding analysis keywords

- **CONNECTOR BEHAVIOR*, **CONNECTOR DAMAGE INITIATION*, **CONNECTOR DAMAGE EVOLUTION*, **CONNECTOR DAMPING*, **CONNECTOR DERIVED COMPONENT*, **CONNECTOR ELASTICITY*, **CONNECTOR FRICTION*, and **CONNECTOR PLASTICITY*

ConnectorPlasticity object

The ConnectorPlasticity object defines plastic behavior for one or more components of a connector's relative motion.

The ConnectorPlasticity object is derived from the *ConnectorBehaviorOption* object.

Access

```
import section
mdb.models[name].sections[name].behaviorOptions[i]
import odbSection
session.odbs[name].sections[name].behaviorOptions[i]
```

ConnectorPlasticity(...)

This method creates a connector plasticity behavior option for a *ConnectorSection* object.

Path

```
import connectorBehavior
connectorBehavior.ConnectorPlasticity
import odbConnectorBehavior
odbConnectorBehavior.ConnectorPlasticity
```

Required arguments

None.

Optional arguments

coupling

A SymbolicConstant specifying whether or not the behavior is coupled. Possible values are UNCOUPLED and COUPLED. The default value is UNCOUPLED.

isotropic

A Boolean specifying whether isotropic hardening data will be used. The default value is ON.

If *isotropic*=OFF, then *kinematic* must be specified as ON.

isotropicType

A SymbolicConstant specifying the type of isotropic hardening to be specified. Possible values are TABULAR and EXPONENTIAL_LAW. The default value is TABULAR.

This argument is applicable only if *isotropic*=ON.

isotropicTemperature

A Boolean specifying whether the isotropic data depend on temperature. The default value is OFF.

This argument is applicable only if *isotropic*=ON.

isotropicDependencies

An Int specifying the number of field variable dependencies for the isotropic data. The default value is 0.

This argument is applicable only if *isotropic*=ON.

kinematic

A Boolean specifying whether kinematic hardening data will be used. The default value is OFF.

If *kinematic*=OFF, then *isotropic* must be specified as ON.

kinematicType

A SymbolicConstant specifying the type of kinematic hardening to be specified. Possible values are HALF_CYCLE, STABILIZED, and PARAMETERS. The default value is HALF_CYCLE.

This argument is applicable only if *kinematic*=ON.

kinematicTemperature

A Boolean specifying whether the kinematic data depend on temperature. The default value is OFF.

This argument is applicable only if *kinematic*=ON.

kinematicDependencies

An Int specifying the number of field variable dependencies for the kinematic data. The default value is 0.

This argument is applicable only if *kinematic*=ON.

forcePotentialOperator

A SymbolicConstant specifying the contribution operator for the force potential contributions. Possible values are SUM and MAXIMUM. The default value is SUM.

This argument is applicable only if *coupling*=COUPLED.

forcePotentialExponent

A Float specifying the number equal to the inverse of the overall exponent in the force potential definition. The default value is 2.0.

This argument is applicable only if *coupling*=COUPLED and if *forcePotentialOperator*=SUM.

connectorPotentials

A *ConnectorPotentialArray* object specifying one *ConnectorPotential* object for each force potential contribution. This member can be specified only if *coupling*=COUPLED.

isotropicTable

A sequence of sequences of Floats specifying isotropic plasticity properties. Items in the *isotropicTable* data are described below. This argument is applicable only if *isotropic*=ON. The default value is an empty sequence.

kinematicTable

A sequence of sequences of Floats specifying kinematic plasticity properties. Items in the *kinematicTable* data are described below. This argument is applicable only if *kinematic*=ON. The default value is an empty sequence.

components

A sequence of Ints specifying the components of relative motion for which the behavior is defined. Possible values are $1 \leq components \leq 6$. Only available components can be specified. This argument can be specified only if *coupling*=UNCOUPLED. The default value is an empty sequence.

Table data

Table data for *isotropicTable*:

If *isotropicType*=TABULAR, then each sequence of the table data specifies the following:

- Equivalent yield force or moment defining the size of the elastic range.
- Equivalent relative plastic motion.
- Equivalent relative plastic motion rate.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *isotropicType*=EXPONENTIAL_LAW, then each sequence of the table data specifies the following:

- Equivalent force or moment defining the size of the elastic range at zero plastic motion.
- Isotropic hardening parameter $Q_{\mathbf{inf}}$.
- Isotropic hardening parameter $\boldsymbol{b}$.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Table data for *kinematicTable*:

If *kinematicType*=HALF_CYCLE, then each sequence of the table data specifies the following:

- Yield force or moment.
- Connector relative plastic motion.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *kinematicType*=STABILIZED, then each sequence of the table data specifies the following:

- Yield force or moment.
- Connector relative plastic motion.
- Connector relative constitutive motion range.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *kinematicType*=PARAMETERS, then each sequence of the table data specifies the following:

- Yield force or moment at zero relative plastic motion.
- Kinematic hardening parameter C.
- Kinematic hardening parameter γ. Set γ=0 to specify linear Ziegler kinematic hardening.
- Temperature, if the data depend on temperature.

- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A ConnectorPlasticity object.

Exceptions

ValueError and TextError.

setValues(...)

This method modifies the ConnectorPlasticity object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConnectorPlasticity* method.

Return value

`None.`

Exceptions

ValueError.

Members

The ConnectorPlasticity object has members with the same names and descriptions as the arguments to the *ConnectorPlasticity* method.

In addition, the ConnectorPlasticity object can have the following members:

isotropicOptions
A *ConnectorOptions* object specifying the *ConnectorOptions* used to define tabular options for the isotropic hardening table.

kinematicOptions
A *ConnectorOptions* object specifying the *ConnectorOptions* used to define tabular options for the kinematic hardening table.

Corresponding analysis keywords

- **CONNECTOR PLASTICITY*, **CONNECTOR HARDENING*, **CONNECTOR POTENTIAL*

ConnectorPotential object

The ConnectorPotential object is used to define a restricted set of mathematical functions to represent yield or limiting surfaces in the space spanned by connector available components. It can be used only in conjunction with *ConnectorDamage*, *ConnectorFriction*, and *ConnectorPlasticity* objects. Because the *ConnectorDamage* object contains two separate ConnectorPotential repositories (one for damage initiation and one for damage evolution), there are two ConnectorPotential constructors associated with that behavior—IniPotential and EvoPotential.

Access

```
import section
mdb.models[name].sections[name].behaviorOptions[i]\
.connectorPotentials[i]
mdb.models[name].sections[name].behaviorOptions[i]\
.evolutionPotentials[i]
mdb.models[name].sections[name].behaviorOptions[i]\
.initiationPotentials[i]
import odbSection
session.odbs[name].sections[name].behaviorOptions[i]\
.connectorPotentials[i]
session.odbs[name].sections[name].behaviorOptions[i]\
.evolutionPotentials[i]
session.odbs[name].sections[name].behaviorOptions[i]\
.initiationPotentials[i]
```

ConnectorPotential(...)

This method creates a connector potential object to be used in conjunction with an allowable connector behavior option.

Path

```
mdb.models[name].sections[name].behaviorOptions[i].ConnectorPotential
session.odbs[name].sections[name].behaviorOptions[i]\
.ConnectorPotential
```

Required arguments

None.

Optional arguments

componentStyle

A SymbolicConstant specifying whether a component number or the name of the *DerivedComponent* object will be used in the contribution. Possible values are COMPONENT_NUMBER and DERIVED_COMPONENT. The default value is COMPONENT_NUMBER.

componentNumber

An Int specifying the component number used in the contribution. This argument is applicable only if *componentStyle*=COMPONENT_NUMBER. Possible values are 1 $\leq$*componentNumber*$\leq$ 6. Only available components can be specified. The default value is 0.

sign
A SymbolicConstant specifying the sign of the contribution. Possible values are POSITIVE and NEGATIVE. The default value is POSITIVE.

scaleFactor
A Float specifying the scaling factor for the contribution. The default value is 1.0.

positiveExponent
A Float specifying the positive exponent for the contribution. The default value is 2.0.

This argument is ignored if the potential operator of the invoking behavior option is set to MAXIMUM.

shiftFactor
A Float specifying the shift factor for the contribution. The default value is 0.0.

hFunction
A SymbolicConstant specifying the H function of the contribution: either absolute value, Macauley bracket, or the identity function. Possible values are ABS, MACAULEY, and IDENTITY. The default value is ABS.

The value of IDENTITY can be used only if *positiveExponent*=1.0 and the potential exponent of the invoking behavior option is also 1.0 (i.e., the potential operator of the invoking behavior option must be SUM).

Return value

A ConnectorPotential object.

Exceptions

ValueError and TextError.

`setValues(...)`

This method modifies the ConnectorPotential object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConnectorPotential* method.

Return value

`None.`

Exceptions

ValueError.

Members

The ConnectorPotential object has members with the same names and descriptions as the arguments to the *ConnectorPotential* method.

In addition, the ConnectorPotential object can have the following member:

derivedComponent A *DerivedComponent* object specifying the *DerivedComponent* used in the contribution. This argument is applicable only if *componentStyle*=DERIVED_COMPONENT.

Corresponding analysis keywords

- **CONNECTOR POTENTIAL*

ConnectorStop object

The ConnectorStop object defines connector stops for one or more components of a connector's relative motion.

The ConnectorStop object is derived from the *ConnectorBehaviorOption* object.

Access

```
import section
mdb.models[name].sections[name].behaviorOptions[i]
import odbSection
session.odbs[name].sections[name].behaviorOptions[i]
```

ConnectorStop(...)

This method creates a connector stop behavior option for a *ConnectorSection* object.

Path

```
import connectorBehavior
connectorBehavior.ConnectorStop
import odbConnectorBehavior
odbConnectorBehavior.ConnectorStop
```

Required arguments

None.

Optional arguments

minMotion

`None` or a Float specifying the lower bound for the connector's relative position for all specified components, or no lower bound. The default value is `None`.

maxMotion

`None` or a Float specifying the upper bound for the connector's relative position for all specified components, or no upper bound. The default value is `None`.

components

A sequence of Ints specifying the components of relative motion for which the behavior is defined. Possible values are $1 \leq components \leq 6$. Only available components can be specified. The default value is an empty sequence.

Return value

A ConnectorStop object.

Exceptions

ValueError and TextError.

setValues(...)

This method modifies the ConnectorStop object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConnectorStop* method.

Return value

`None.`

Exceptions

ValueError.

Members

The ConnectorStop object has members with the same names and descriptions as the arguments to the *ConnectorStop* method.

Corresponding analysis keywords

- **CONNECTOR STOP*

DerivedComponent object

A DerivedComponent object describes user-customized components for use in defining *ConnectorFriction* and *Potential* objects.

Access

```
import section
mdb.models[name].sections[name].behaviorOptions[i]\
.connectorPotentials[i].derivedComponent
mdb.models[name].sections[name].behaviorOptions[i].derivedComponent
mdb.models[name].sections[name].behaviorOptions[i]\

session.odbs[name].sections[name].behaviorOptions[i].DerivedComponent
session.odbs[name].sections[name].behaviorOptions[i]\
.evolutionPotentials[i].DerivedComponent
session.odbs[name].sections[name].behaviorOptions[i]\
.initiationPotentials[i].DerivedComponent
```

Arguments

None.

Return value

A DerivedComponent object.

Exceptions

ValueError and TextError.

setValues(...)

This method modifies the DerivedComponent object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *DerivedComponent* method.

Return value

`None.`

Exceptions

ValueError.

Members

The DerivedComponent object can have the following member:

cdcTerms A *CDCTermArray* object.

Corresponding analysis keywords

- **CONNECTOR DERIVED COMPONENT*

TangentialBehavior object

The TangentialBehavior object specifies tangential behavior for a connector friction behavior option.

Access

```
import section
mdb.models[name].sections[name].behaviorOptions[i].tangentialBehavior
import odbSection
session.odbs[name].sections[name].behaviorOptions[i]\
.tangentialBehavior
```

TangentialBehavior(...)

This method creates a TangentialBehavior object.

Path

```
mdb.models[name].sections[name].behaviorOptions[i].TangentialBehavior
session.odbs[name].sections[name].behaviorOptions[i]\
.TangentialBehavior
```

Required arguments

None.

Optional arguments

formulation

A SymbolicConstant specifying the friction coefficient formulation. Possible values are PENALTY and EXPONENTIAL_DECAY. The default value is PENALTY.

slipRateDependency

A Boolean specifying whether the data depend on slip rate. The default value is OFF.

pressureDependency

A Boolean specifying whether the data depend on contact pressure. The default value is OFF.

temperatureDependency

A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies

An Int specifying the number of field variables for the data. The default value is 0.

exponentialDecayDefinition

A SymbolicConstant specifying the exponential decay definition for the data. Possible values are COEFFICIENTS and TEST_DATA. The default value is COEFFICIENTS.

shearStressLimit

`None` or a Float specifying no upper limit or the friction coefficient shear stress limit. The default value is `None`.

maximumElasticSlip

A SymbolicConstant specifying the method for modifying the allowable elastic slip. Possible values are FRACTION and ABSOLUTE_DISTANCE. The default value is FRACTION.

This argument applies only to Abaqus/Standard analyses.

fraction
A Float specifying the ratio of the allowable maximum elastic slip to a characteristic model dimension. The default value is 10^{-4}.

This argument applies only to Abaqus/Standard analyses.

absoluteDistance
`None` or a Float specifying the absolute magnitude of the allowable elastic slip. The default value is `None`.

This argument applies only to Abaqus/Standard analyses.

table
A sequence of sequences of Floats specifying the tangential properties. Items in the table data are described below. The default value is an empty sequence.

Table data

If *formulation*=PENALTY, the table data specify the following:

- Friction coefficient in the slip direction, μ.
- Slip rate, if the data depend on slip rate.
- Contact pressure, if the data depend on contact pressure.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *formulation*=EXPONENTIAL_DECAY and *exponentialDecayDefinition*=COEFFICIENTS, the table data specify the following:

- Static friction coefficient, μ_s.
- Kinetic friction coefficient, μ_k.
- Decay coefficient, d_c.

If *formulation*=EXPONENTIAL_DECAY and *exponentialDecayDefinition*=TEST_DATA, the table data specify the following:

- Static coefficient of friction.
- Dynamic friction coefficient measured at the reference slip rate, $\dot{\gamma}_2$.
- Reference slip rate, $\dot{\gamma}_2$, used to measure the dynamic friction coefficient.
- Kinetic friction coefficient, μ_∞. This value corresponds to the asymptotic value of the friction coefficient at infinite slip rate, $\dot{\gamma}_\infty$.

Return value

A TangentialBehavior object.

Exceptions

None.

`setValues(...)`

This method modifies the TangentialBehavior object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *TangentialBehavior* method.

Return value

`None.`

Exceptions

None.

Members

The TangentialBehavior object has members with the same names and descriptions as the arguments to the *TangentialBehavior* method.

Corresponding analysis keywords

- **FRICTION*

Constraint commands

The Constraint commands define constraints between regions of the model.

In this section:

- *Constraint object*
- *AdjustPoints object*
- *Coupling object*
- *DisplayBody object*
- *EmbeddedRegion object*
- *Equation object*
- *MultipointConstraint object*
- *RigidBody object*
- *ShellSolidCoupling object*
- *Tie object*

Constraint object

The Constraint object is the abstract base type for other Constraint objects. The Constraint object has no explicit constructor. The members of the Constraint object are common to all objects derived from the Constraint.

Access

```
import interaction
mdb.models[name].constraints[name]
```

`resume()`

This method resumes the constraint that was previously suppressed.

Arguments

None.

Return value

`None.`

Exceptions

None.

`suppress()`

This method suppresses the constraint.

Arguments

None.

Return value

`None.`

Exceptions

None.

`delete(...)`

This method allows you to delete existing constraints.

Required arguments

indices A sequence of Ints specifying the index of each constraint to delete.

Optional arguments

None.

Return value

None.

Exceptions

None.

Members

The Constraint object has the following members:

name

A String specifying the constraint repository key.

suppressed

A Boolean specifying whether the constraint is suppressed or not. The default value is OFF.

AdjustPoints object

The AdjustPoints constraint object is used to adjust points (nodes) to a surface.

The AdjustPoints object is derived from the *Constraint* object.

Access

```
import interaction
mdb.models[name].constraints[name]
```

AdjustPoints(...)

This method creates an AdjustPoints object.

Path

```
mdb.models[name].AdjustPoints
```

Required arguments

name	A String specifying the constraint repository key.
surface	A *Region* object specifying the surface to which the *controlPoints* are adjusted.
controlPoints	A *Region* object specifying the constraint control points.

Optional arguments

None.

Return value

An AdjustPoints object.

Exceptions

None.

`setValues(...)`

This method modifies the AdjustPoints object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *AdjustPoints* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The AdjustPoints object has members with the same names and descriptions as the arguments to the *AdjustPoints* method.

In addition, the AdjustPoints object has the following member:

suppressed
A Boolean specifying whether the constraint is suppressed or not. The default value is OFF.

Corresponding analysis keywords

- **ADJUST*

Coupling object

The Coupling object defines a constraint between a group of coupling nodes located on a region and a reference point.

The Coupling object is derived from the *Constraint* object.

Access

```
import interaction
mdb.models[name].constraints[name]
```

Coupling(...)

This method creates a Coupling object.

Path

```
mdb.models[name].Coupling
```

Required arguments

controlPoint A *Region* object specifying the constraint control point.

couplingType A SymbolicConstant specifying the coupling constraint type. Possible values are KINEMATIC, DISTRIBUTING, STRUCTURAL, and UNIFORM.

influenceRadius The SymbolicConstant WHOLE_SURFACE or a Float specifying the influence radius.

name A String specifying the constraint repository key.

rotationalCouplingType A SymbolicConstant specifying the rotational coupling constraint type. Possible values are ROTATIONAL_CONTINUUM and ROTATIONAL_STRUCTURAL.

surface A *Region* object specifying the surface on which the coupling nodes are located.

Optional arguments

adjust A Boolean specifying if the control point will be adjusted (moved) to the surface. The point will be adjusted in the direction normal to the specified surface. The default value is OFF.

alpha A Float specifying the value of the thermal expansion coefficient. The default value is 0.0.

The *alpha* argument applies only when *couplingType*=KINEMATIC.

localCsys `None` or a *DatumCsys* object specifying the initial orientation of the local coordinate system for the coupling's degrees of freedom. If *localCsys*=`None`, the coupling is defined in the global coordinate system. The default value is `None`.

temperatureDOFType An integer specifying the temperature degree of freedom to be coupled. Possible values range from 1 to 20. The default value is 0.

The *temperatureDOFType* argument applies only when *couplingType*=UNIFORM and *uniformConstraint*=DOF_TEMPERATURE.

uniformConstraint

A SymbolicConstant specifying the nonmechanical degrees of freedom of surface nodes to be coupled to the same degree of freedom of a reference node. Possible values are WARP_AMPLITUDE, PORE_PRESSURE, ELECTRIC_POTENTIAL, CONNECTOR_MATERIAL_FLOW, DOF_TEMPERATURE, SLURRY_CONCENTRATION, ELECTROLYTE_ELECTRIC_POTENTIAL, ION_CONCENTRATION, and SPECIES_CONCENTRATION.

The *uniformConstraint* argument applies only when *couplingType*=UNIFORM.

u1

A Boolean specifying if the displacement component in the 1-direction is constrained to the reference node for a kinematic coupling constraint. The default value is ON.

The *u1* argument applies only when *couplingType*=KINEMATIC.

u2

A Boolean specifying if the displacement component in the 2-direction is constrained to the reference node for a kinematic coupling constraint. The default value is ON.

The *u2* argument applies only when *couplingType*=KINEMATIC.

u3

A Boolean specifying if the displacement component in the 3-direction is constrained to the reference node for a kinematic coupling constraint. The default value is ON.

The *u3* argument applies only when *couplingType*=KINEMATIC.

ur1

A Boolean specifying if the rotational displacement component about the 1-direction is constrained to the reference node for a kinematic coupling constraint. The default value is ON.

The *ur1* argument applies only when *couplingType*=KINEMATIC.

ur2

A Boolean specifying if the rotational displacement component about the 2-direction is constrained to the reference node for a kinematic coupling constraint. The default value is ON.

The *ur2* argument applies only when *couplingType*=KINEMATIC.

ur3

A Boolean specifying if the rotational displacement component about the 3-direction is constrained to the reference node for a kinematic coupling constraint. The default value is ON.

The *ur3* argument applies only when *couplingType*=KINEMATIC.

weightingMethod

A SymbolicConstant specifying an optional weighting method used for calculating the distributing weight factors. Possible values are UNIFORM, LINEAR, QUADRATIC, and CUBIC. The default value is UNIFORM.

The *weightingMethod* argument applies only when *couplingType*=DISTRIBUTING.

Return value

A Coupling object.

Exceptions

None.

`setValues(...)`

This method modifies the Coupling object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Coupling* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The Coupling object has members with the same names and descriptions as the arguments to the *Coupling* method.

In addition, the Coupling object has the following member:

suppressed
A Boolean specifying whether the constraint is suppressed or not. The default value is OFF.

Corresponding analysis keywords

- **COUPLING*

DisplayBody object

The DisplayBody object defines a constraint such that the specified instance is used for display only and does not take part in the analysis. However it will still be visible during postprocessing and its position at any frame will be defined by the translation and rotation of the specified control points.

The DisplayBody object is derived from the *Constraint* object.

Access

```
import interaction
mdb.models[name].constraints[name]
```

DisplayBody(...)

This method creates a DisplayBody object.

Path

```
mdb.models[name].DisplayBody
```

Required arguments

name A String specifying the constraint repository key.

instance A *PartInstance* object specifying the part instance that is to be used for display only.

controlPoints A *ModelDotArray* object specifying the motion of the *PartInstance*. The control points may be Vertex, ReferencePoint, or MeshNode objects. Their motion will control the motion of the PartInstance. If this argument is set to an empty sequence, the PartInstance will remain fixed in space during the analysis. The sequence can have either one object or three objects.

Optional arguments

None.

Return value

A DisplayBody object.

Exceptions

None.

setValues(...)

This method modifies the DisplayBody object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *DisplayBody* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The DisplayBody object has members with the same names and descriptions as the arguments to the *DisplayBody* method.

In addition, the DisplayBody object has the following member:

suppressed
A Boolean specifying whether the constraint is suppressed or not. The default value is OFF.

Corresponding analysis keywords

- **DISPLAY BODY*

EmbeddedRegion object

The EmbeddedRegion object allows you to embed a region of the model within a “host” region of the model or within the whole model.

The EmbeddedRegion object is derived from the *Constraint* object.

Access

```
import interaction
mdb.models[name].constraints[name]
```

EmbeddedRegion(...)

This method creates a EmbeddedRegion object.

Path

```
mdb.models[name].EmbeddedRegion
```

Required arguments

name
A String specifying the constraint repository key.

embeddedRegion
A *Region* object specifying the body region to be embedded.

hostRegion
A *Region* object specifying the host region. A value of `None` indicates that the host region is the whole model.

Optional arguments

weightFactorTolerance
A Float specifying a small value below which the weighting factors will be zeroed out. The default value is 10^{-6}.

toleranceMethod
A SymbolicConstant specifying the method used to determine the embedded element tolerance. Possible values are ABSOLUTE, FRACTIONAL, and BOTH. The default value is BOTH.

absoluteTolerance
A Float specifying the absolute value by which a node on the embedded region may lie outside the host region. If *absoluteTolerance*=0.0, the *fractionalTolerance* value will be used. The default value is 0.0.

This argument applies only when *toleranceMethod*=ABSOLUTE or BOTH.

fractionalTolerance
A Float specifying the fractional value by which a node on the embedded region may lie outside the host region. The fractional value is based on the average element size within the host region. The default value is 0.05.

If both tolerance arguments are specified, the smaller value will be used.

This argument applies only when *toleranceMethod*=FRACTIONAL or BOTH.

Return value

An EmbeddedRegion object.

Exceptions

None.

setValues(...)

This method modifies the EmbeddedRegion object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *EmbeddedRegion* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The EmbeddedRegion object has members with the same names and descriptions as the arguments to the *EmbeddedRegion* method.

In addition, the EmbeddedRegion object has the following member:

suppressed
A Boolean specifying whether the constraint is suppressed or not. The default value is OFF.

Corresponding analysis keywords

- **EMBEDDED ELEMENT*

Equation object

The Equation object defines a linear multi-point constraint between a set of degrees of freedom.

The Equation object is derived from the *Constraint* object.

Access

```
import interaction
mdb.models[name].constraints[name]
```

Equation(...)

This method creates an Equation object.

Path

```
mdb.models[name].Equation
```

Required arguments

name A String specifying the constraint repository key.

terms A sequence of (Float, String, Int, Int) sequences specifying a coefficient, Set name, degree of freedom, and coordinate system ID. The coordinate system ID is optional.

Optional arguments

None.

Return value

An Equation object.

Exceptions

If *terms* does not contain more than one entry: Equation must have two or more terms.

`setValues(...)`

This method modifies the Equation object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Equation* method, except for the *name* argument.

Return value

```
None.
```

Exceptions

If *terms* does not contain more than one entry: Equation must have two or more terms.

Members

The Equation object has members with the same names and descriptions as the arguments to the *Equation* method.

In addition, the Equation object has the following member:

suppressed A Boolean specifying whether the constraint is suppressed or not. The default value is OFF.

Corresponding analysis keywords

- **EQUATION*

MultipointConstraint object

The MultipointConstraint object defines a constraint between a group of MultipointConstraint nodes located on a region and a reference point.

The MultipointConstraint object is derived from the *Constraint* object.

Access

```
import interaction
mdb.models[name].constraints[name]
```

MultipointConstraint(...)

This method creates a MultipointConstraint object.

Path

```
mdb.models[name].MultipointConstraint
```

Required arguments

name
A String specifying the constraint repository key.

surface
A *Region* object specifying the surface on which the MultipointConstraint nodes are located.

controlPoint
A *Region* object specifying the constraint control point.

mpcType
A SymbolicConstant specifying the MPC type of the constraint. Possible values are BEAM_MPC, ELBOW_MPC, PIN_MPC, LINK_MPC, TIE_MPC, and USER_MPC.

Optional arguments

csys
`None` or a *DatumCsys* object specifying the initial orientation of the local coordinate system for the MultipointConstraint's degrees of freedom. If *localCsys*=`None`, the MultipointConstraint is defined in the global coordinate system. The default value is `None`.

userType
An Int specifying to differentiate between different constraint types in a user-defined MultipointConstraint. The default value is 0.

The *userType* argument applies only when *mpcType*=USER_MPC.

userMode
A SymbolicConstant specifying the mode of the constraint when it is user-defined. Possible values are DOF_MODE_MPC and NODE_MODE_MPC. The default value is DOF_MODE_MPC.

The *userMode* argument applies only when *mpcType*=USER_MPC.

Return value

A MultipointConstraint object.

Exceptions

None.

setValues(...)

This method modifies the MultipointConstraint object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *MultipointConstraint* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The MultipointConstraint object has members with the same names and descriptions as the arguments to the *MultipointConstraint* method.

In addition, the MultipointConstraint object has the following member:

suppressed
A Boolean specifying whether the constraint is suppressed or not. The default value is OFF.

Corresponding analysis keywords

- **MPC*

RigidBody object

The RigidBody object constrains all the degrees of freedom on the specified regions to the degree of freedom of its associated reference point.

The RigidBody object is derived from the *Constraint* object.

Access

```
import interaction
mdb.models[name].constraints[name]
```

RigidBody(...)

This method creates a RigidBody object.

Path

```
mdb.models[name].RigidBody
```

Required arguments

name
A String specifying the constraint repository key.

refPointRegion
A *Region* object specifying the reference point.

Optional arguments

bodyRegion
`None` or a *Region* object specifying the elements constrained to the movement of the reference point. The default value is `None`.

tieRegion
`None` or a *Region* object specifying the nodes tied to the movement of the reference point. The default value is `None`.

pinRegion
`None` or a *Region* object specifying the nodes pinned to the movement of the reference point. The default value is `None`.

surfaceRegion
`None` or a *Region* object specifying the analytic surface constrained to the movement of the reference point. The default value is `None`.

refPointAtCOM
A Boolean specifying whether the analysis product should recompute the reference point position to be at the center of mass. The default value is OFF.

isothermal
A Boolean specifying whether the temperature degree of freedom should be constrained. The default value is OFF.

Return value

A RigidBody object.

Exceptions

None.

setValues(...)

This method modifies the RigidBody object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *RigidBody* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The RigidBody object has members with the same names and descriptions as the arguments to the *RigidBody* method.

In addition, the RigidBody object has the following member:

suppressed
A Boolean specifying whether the constraint is suppressed or not. The default value is OFF.

Corresponding analysis keywords

- **RIGID BODY*

ShellSolidCoupling object

The ShellSolidCoupling object defines two surfaces to be tied together for the duration of a simulation.

The ShellSolidCoupling object is derived from the *Constraint* object.

Access

```
import interaction
mdb.models[name].constraints[name]
```

ShellSolidCoupling(...)

This method creates a ShellSolidCoupling object.

Path

```
mdb.models[name].ShellSolidCoupling
```

Required arguments

name A String specifying the constraint repository key.

shellEdge A *Region* object specifying the name of the shell edge surface.

solidFace A *Region* object specifying the name of the solid surface.

Optional arguments

positionToleranceMethod A SymbolicConstant specifying the method used to determine the position tolerance. Possible values are COMPUTED and SPECIFIED. The default value is COMPUTED.

positionTolerance A Float specifying the position tolerance. The default value is 0.0.

The *positionTolerance* argument applies only when *positionToleranceMethod*=SPECIFIED.

Note:

Abaqus will not constrain nodes on the solid face region outside the position tolerance.

influenceDistanceMethod A SymbolicConstant specifying the method used to determine the influence distance. Possible values are DEFAULT and SPECIFIED. The default value is DEFAULT.

influenceDistance A Float specifying the influence distance. The *influenceDistance* argument applies only when *influenceDistanceMethod*=SPECIFIED. The default value is 0.0.

Return value

A ShellSolidCoupling object.

Exceptions

None.

setValues(...)

This method modifies the ShellSolidCoupling object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ShellSolidCoupling* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The ShellSolidCoupling object has members with the same names and descriptions as the arguments to the *ShellSolidCoupling* method.

In addition, the ShellSolidCoupling object has the following member:

suppressed
A Boolean specifying whether the constraint is suppressed or not. The default value is OFF.

Corresponding analysis keywords

- **SHELL TO SOLID COUPLING*

Tie object

The Tie object defines two surfaces to be tied together for the duration of a simulation.

The Tie object is derived from the *Constraint* object.

Access

```
import interaction
mdb.models[name].constraints[name]
```

Tie(...)

This method creates a Tie object.

Path

```
mdb.models[name].Tie
```

Required arguments

name	A String specifying the constraint repository key.
main	A *Region* object specifying the name of the main surface.
secondary	A *Region* object specifying the name of the secondary surface.

Optional arguments

adjust	A Boolean specifying whether initial positions of tied secondary nodes are adjusted to lie on the main surface. The default value is ON.
positionToleranceMethod	A SymbolicConstant specifying the method used to determine the position tolerance. Possible values are COMPUTED and SPECIFIED. The default value is COMPUTED.
positionTolerance	A Float specifying the position tolerance. The *positionTolerance* argument applies only when *positionToleranceMethod*=SPECIFIED. The default value is 0.0.
tieRotations	A Boolean specifying whether rotation degrees of freedom should be tied. The default value is ON.
tieTemperature	A Boolean specifying whether temperature degrees of freedom should be tied. The default value is ON.
tiePore	A Boolean specifying whether pore pressure degrees of freedom should be tied. The default value is ON.
electricPotential	A Boolean specifying whether electric potential in solid degrees of freedom should be tied. The default value is ON.

fluidElectricPotential A Boolean specifying whether electric potential in fluid degrees of freedom should be tied. The default value is ON.

ionConcentration A Boolean specifying whether ion concentration in fluid degrees of freedom should be tied. The default value is ON.

constraintRatioMethod A SymbolicConstant specifying the method used to determine the constraint ratio. Possible values are DEFAULT and SPECIFIED. The default value is DEFAULT.

constraintRatio A Float specifying the fractional distance between the main reference surface and the secondary node at which the translational constraint should act. The *constraintRatio* argument applies only when *constraintRatioMethod*=SPECIFIED. The default value is 0.0.

constraintEnforcement A SymbolicConstant specifying the discretization method. Possible values are SOLVER_DEFAULT, NODE_TO_SURFACE, and SURFACE_TO_SURFACE. The default value is SOLVER_DEFAULT.

thickness A Boolean specifying whether shell element thickness is considered. The default value is ON.

Return value

A Tie object.

Exceptions

None.

swapSurfaces()

This method switches the main and secondary surfaces of a tied constraint. This command is valid only during the step in which the interaction is created.

Arguments

None.

Return value

`None.`

Exceptions

None.

setValues(...)

This method modifies the Tie object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Tie* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The Tie object has members with the same names and descriptions as the arguments to the *Tie* method.

In addition, the Tie object has the following member:

suppressed
A Boolean specifying whether the constraint is suppressed or not. The default value is OFF.

Corresponding analysis keywords

- **TIE*

CustomKernel module

The `customKernel` module augments the mdb, odb, and session objects with an object called customData. The customData object can contain custom data that you created using standard Python objects; for example, dictionaries, strings, numbers, and classes. In addition, the customData object can contain objects that you created using the classes described in this section.

All objects that you create under the mdb.customData and odb[odbName].customData object will be stored in the Abaqus/CAE model and output database, respectively, when you save the database; all objects that you create under the session.customData object will be lost when you exit Abaqus/CAE.

The customData object is an instance of the RepositorySupport class; for more information, see *RepositorySupport*. The classes described in this section register with the GUI infrastructure when you create the class. As a result, if you write a custom GUI script, you can query these objects from the GUI, and you can also be notified when the contents of these objects change so you can update the GUI accordingly. For more information, see *Extending the Abaqus Scripting Interface* and *Accessing kernel data from the GUI*.

In this section:

- *CommandRegister object*
- *RepositorySupport object*
- *RegisteredDictionary object*
- *RegisteredList object*
- *RegisteredTuple object*

CommandRegister object

This class allows you to derive a general class that can be queried from the GUI and is capable of notifying the GUI when the contents of the class change.

Access

```
import customKernel
```

CommandRegister()

This class allows you to derive a general class that can be queried from the GUI and is capable of notifying the GUI when the contents of the class change.

Path

customKernel.CommandRegister

Arguments

None.

Return value

A CommandRegister object.

Exceptions

None.

Members

The CommandRegister object has no members.

RepositorySupport object

The RepositorySupport is a base class from which you can derive your own classes that are designed to contain custom repositories. Instances of this class can be queried from the GUI and are capable of notifying the GUI when the contents of the instance change.

The RepositorySupport object is derived from the *CommandRegister* object.

Access

```
import customKernel
mdb.customData
session.customData
session.odbs[name].customData
```

RepositorySupport()

This method creates a RepositorySupport object.

Path

customKernel.RepositorySupport

Arguments

None.

Return value

A RepositorySupport object.

Exceptions

None.

Repository(...)

This method installs a repository on the class. The repository is an instance of a RegisteredDictionary class. Refer to *RegisteredDictionary* for details on its methods.

The objects stored in the repository are assumed to have an attribute called *name* that stores the key used to access the object in the repository. The name attribute will be modified by the `changeKey` method.

Required arguments

name	A String specifying the name of the repository.
constructors	A constructor or sequence of constructors specifying which classes will store their instances in the repository.

Optional arguments

None.

Return value

```
None.
```

Exceptions

None.

Members

The RepositorySupport object has no members.

RegisteredDictionary object

This class allows you to create a dictionary that can be queried from the GUI and is capable of notifying the GUI when the contents of the dictionary change. The keys to a RegisteredDictionary must be either strings or integers.

The RegisteredDictionary object is derived from the *CommandRegister* object.

Access

```
import customKernel
```

RegisteredDictionary()

This method creates a RegisteredDictionary object.

Path

customKernel.RegisteredDictionary

Arguments

None.

Return value

A RegisteredDictionary object.

Exceptions

None.

Methods()

The RegisteredDictionary object supports the same methods as a Python dictionary. In addition, the RegisteredDictionary object supports the `changeKey` method.

Arguments

None.

Return value

`None.`

Exceptions

None.

changeKey(...)

This method changes the name of a key in the dictionary.

Required arguments

fromName	A String or an integer specifying the name of the key to be changed.
toName	A String or an integer specifying the new name for the key.

Optional arguments

None.

Return value

`None`.

Exceptions

None.

Members

The RegisteredDictionary object has no members.

RegisteredList object

This class allows you to create a list that can be queried from the GUI and is capable of notifying the GUI when the contents of the list change.

The RegisteredList object is derived from the *CommandRegister* object.

Access

```
import customKernel
```

RegisteredList()

This method creates a RegisteredList object.

Path

customKernel.RegisteredList

Arguments

None.

Return value

A RegisteredList object.

Exceptions

None.

Methods()

The RegisteredList object supports the same methods as a standard Python list object.

Arguments

None.

Return value

`None.`

Exceptions

None.

Members

The RegisteredList object has no members.

RegisteredTuple object

This class allows you to create a tuple that can be queried from the GUI and is capable of notifying the GUI when the contents of any of the tuple's members change.

The RegisteredTuple object is derived from the *CommandRegister* object.

Access

```
import customKernel
```

RegisteredTuple(...)

This method creates a RegisteredTuple object.

Path

customKernel.RegisteredTuple

Required arguments

tuple A tuple of objects. These objects must be derived from the CommandRegister class.

Optional arguments

None.

Return value

A RegisteredTuple object.

Exceptions

None.

Methods()

The RegisteredTuple object supports the same methods as a standard Python list object.

Arguments

None.

Return value

`None.`

Exceptions

None.

Members

The RegisteredTuple object has no members.

Datum commands

Datum commands return Feature objects and inherit the methods of Feature objects.
For more details, see *Feature commands*. Datums can be created using methods on a Part or Assembly object.

Each command also creates a Datum object in the corresponding datum repository. The Datum object is used as an argument to other commands, such as Part and Partition commands.

In this section:

- *Datum object*
- *DatumAxis object*
- *DatumCsys object*
- *DatumPlane object*
- *DatumPoint object*

Datum object

The Datum object is the abstract base type for other Datum objects. The Datum object has no explicit constructor. The methods and members of the Datum object are common to all objects derived from the Datum.

Access

```
import part
mdb.models[name].parts[name].datums[i]
import assembly
mdb.models[name].rootAssembly.allInstances[name].datums[i]
mdb.models[name].rootAssembly.datums[i]
mdb.models[name].rootAssembly.instances[name].datums[i]
mdb.models[name].rootAssembly.modelInstances[i].datums[i]
```

Members

The Datum object has no members.

DatumAxis object

The DatumAxis object has no direct constructor; it is created when a *Feature* object is created. For example, the DatumAxisByCylFace method creates a Feature object that creates a DatumAxis object.

The DatumAxis object is derived from the *Datum* object.

Access

```
import part
mdb.models[name].parts[name].datums[i]
import assembly
mdb.models[name].rootAssembly.allInstances[name].datums[i]
mdb.models[name].rootAssembly.datums[i]
mdb.models[name].rootAssembly.instances[name].datums[i]
```

Members

The DatumAxis object has the following members:

pointOn

A tuple of Floats specifying the *X*-, *Y*-, and *Z*-coordinates of a point located on the datum.

direction

A tuple of Floats specifying a sequence of three Floats specifying the direction of the axis.

DatumCsys object

The DatumCsys object has no direct constructor; it is created when a *Feature* object is created. For example, the DatumCsysByOffset method creates a Feature object that creates a DatumCsys object.

The DatumCsys object is derived from the *Datum* object.

Access

```
import part
mdb.models[name].parts[name].datums[i]
import assembly
mdb.models[name].rootAssembly.allInstances[name].datums[i]
mdb.models[name].rootAssembly.connectorOrientations[i].localCsys1
mdb.models[name].rootAssembly.connectorOrientations[i].localCsys2
mdb.models[name].rootAssembly.datums[i]
mdb.models[name].rootAssembly.instances[name].datums[i]
import odbAccess
session.odbs[name].rootAssembly.connectorOrientations[i].localCsys1
session.odbs[name].rootAssembly.connectorOrientations[i].localCsys2
```

`globalToLocal(...)`

This method transforms specified coordinates in the global coordinate system into this local coordinate system.

Required arguments

coordinates A tuple of three Floats representing the coordinates in the global coordinate system.

Optional arguments

None.

Return value

A tuple of three Floats representing the coordinates in this local coordinate system.

Exceptions

None.

`localToGlobal(...)`

This method transforms specified coordinates in this local coordinate system into the global coordinate system.

Required arguments

coordinates A tuple of three Floats representing the coordinates in this local coordinate system.

Optional arguments

None.

Return value

A tuple of three Floats representing the coordinates in the global coordinate system.

Exceptions

None.

Members

The DatumCsys object has the following members:

coordSysType
A SymbolicConstant specifying the type of the coordinate system. Possible values are CARTESIAN, CYLINDRICAL, and SPHERICAL.

origin
A *DatumPoint* object specifying the origin of the coordinate system.

axis1
A *DatumAxis* object specifying the 1-direction of the coordinate system.

axis2
A *DatumAxis* object specifying the 2-direction of the coordinate system.

axis3
A *DatumAxis* object specifying the 3-direction of the coordinate system.

DatumPlane object

The DatumPlane object has no direct constructor; it is created when a *Feature* object is created. For example, the DatumPlaneByPrincipalPlane method creates a Feature object that creates a DatumPlane object.

The DatumPlane object is derived from the *Datum* object.

Access

```
import part
mdb.models[name].parts[name].datums[i]
import assembly
mdb.models[name].rootAssembly.allInstances[name].datums[i]
mdb.models[name].rootAssembly.datums[i]
mdb.models[name].rootAssembly.instances[name].datums[i]
```

Members

The DatumPlane object has the following members:

pointOn
A tuple of Floats specifying the *X*-, *Y*-, and *Z*-coordinates of a point located on the datum.

normal
A tuple of Floats specifying a sequence of three Floats specifying the normal.

DatumPoint object

The DatumPoint object has no direct constructor; it is created when a *Feature* object is created. For example, the DatumPointByCoordinate method creates a Feature object that creates a DatumPoint object.

The DatumPoint object is derived from the *Datum* object.

Access

```
import part
mdb.models[name].parts[name].datums[i]
import assembly
mdb.models[name].rootAssembly.allInstances[name].datums[i]
mdb.models[name].rootAssembly.datums[i]
mdb.models[name].rootAssembly.instances[name].datums[i]
```

Members

The DatumPoint object has the following member:

pointOn A tuple of Floats specifying the *X*-, *Y*-, and *Z*-coordinates of a point located on the datum.

Display Group commands

Display group commands are used to select a subset of the entities displayed in the viewport.

In this section:

- *DisplayGroup object*
- *DisplayGroupInstance object*
- *DisplayGroupInstanceRepository object*
- *Leaf object*
- *LeafFromConstraintNames object*
- *LeafFromDatums object*
- *LeafFromDisplayGroup object*
- *LeafFromElementLabels object*
- *LeafFromElementSets object*
- *LeafFromElementVarRange object*
- *LeafFromGeometry object*
- *LeafFromInstance object*
- *LeafFromInstanceElementLabels object*
- *LeafFromInstanceNodeLabels object*
- *LeafFromMeshElementLabels object*
- *LeafFromMeshNodeLabels object*
- *LeafFromMeshSurfaceSets object*
- *LeafFromModelElemLabels object*
- *LeafFromModelNodeLabels object*
- *LeafFromNodeLabels object*
- *LeafFromNodeSets object*
- *LeafFromNodeVarRange object*
- *LeafFromOdbElementLayups object*
- *LeafFromOdbElementMaterials object*
- *LeafFromOdbElementPick object*
- *LeafFromOdbElementPlies object*
- *LeafFromOdbElementSections object*
- *LeafFromOdbElementTypes object*
- *LeafFromOdbNodePick object*
- *LeafFromOdbEdgePick object*
- *LeafFromPartElementLabels object*
- *LeafFromPartInstance object*
- *LeafFromPartNodeLabels object*
- *LeafFromReferencePoint object*
- *LeafFromSets object*
- *LeafFromSurfaceSets object*
- *LeafFromSurfaceVarRange object*

DisplayGroup object

DisplayGroup objects are used to select a subset of the entities displayed in the viewport.

Access

```
session.displayGroups[name]
import assembly
session.viewports[name].assemblyDisplay.displayGroup
session.viewports[name].layers[name].assemblyDisplay.displayGroup
import visualization
session.viewports[name].layers[name].odbDisplay.displayGroup
import part
session.viewports[name].layers[name].partDisplay.displayGroup
session.viewports[name].odbDisplay.displayGroup
session.viewports[name].partDisplay.displayGroup
```

DisplayGroup(...)

This method creates a DisplayGroup object.

Path

session.DisplayGroup

Required arguments

name A String specifying the repository key.

leaf A *Leaf* object specifying the items in the display group.

Optional arguments

None.

Return value

A DisplayGroup object.

Exceptions

InvalidNameError.

add(...)

This method adds the specified items to the display group.

Required arguments

leaf A *Leaf* object specifying the items to add to the display group.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`either(...)`

This method redefines the display group to be only those items that are not shared by the *leaf* argument and by the display group.

Required arguments

leaf A *Leaf* object specifying the items to be excluded from the display group.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`intersect(...)`

This method redefines the display group to be only those items that are shared by the *leaf* argument and the display group.

Required arguments

leaf A *Leaf* object specifying the items to be included in the display group.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

redoLast()

This method redoes the last undone operation on the display group.

Arguments

None.

Return value

`None.`

Exceptions

None.

remove(...)

This method removes the specified items from the display group.

Required arguments

leaf A *Leaf* object specifying the items to remove from the display group.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

replace(...)

This method replaces the contents of the display group with the specified items.

Required arguments

leaf A *Leaf* object specifying the items with which to replace the current display group contents.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

undoLast()

This method undoes the last operation performed on the display group.

Arguments

None.

Return value

`None.`

Exceptions

None.

Members

The DisplayGroup object has the following members:

canUndo
A Boolean specifying whether Undo is possible or not.

canRedo
A Boolean specifying whether Redo is possible or not.

name
A String specifying the repository key.

module
A SymbolicConstant specifying the module in which the display group has been created. The possible values are PART, ASSEMBLY, PART_ASSEMBLY, ODB, and ALL.

modelName
A String specifying the name of the model to which the display group belongs when the module is part- or assembly-based.

partName
A String specifying the name of the part to which the display group belongs when the module is part-based.

DisplayGroupInstance object

A DisplayGroupInstance object stores the IDs of the entities displayed in a viewport. The DisplayGroupInstance object has no constructor. When you set a display group to be plotted in a viewport, Abaqus/CAE creates a DisplayGroupInstance object for each display group and places it in the *DisplayGroupInstanceRepository* object.

Access

```
import assembly
session.viewports[name].assemblyDisplay.displayGroupInstances[name]
session.viewports[name].layers[name].assemblyDisplay\
.displayGroupInstances[name]
import visualization
session.viewports[name].layers[name].odbDisplay\
.displayGroupInstances[name]
import part
session.viewports[name].layers[name].partDisplay\
.displayGroupInstances[name]
session.viewports[name].odbDisplay.displayGroupInstances[name]
session.viewports[name].partDisplay.displayGroupInstances[name]
```

`nodes()`

This method is used to obtain the list of nodes present in the DisplayGroupInstance object. It returns a Dictionary object keyed by part instance names, the value of which is a list of user node labels belonging to the part instance and contained in the DisplayGroupInstance object. This method is available only for DisplayGroupInstance objects that are members of the DisplayGroupInstance repository member of *OdbDisplay* object.

Arguments

None.

Return value

A Dictionary object.

Exceptions

None.

`elements()`

This method returns the list of elements present in the DisplayGroupInstance object. The `elements` method returns a Dictionary object that uses part instance names for the keys. The value of the items in the Dictionary object is a List of user element labels that belong to the part instance and are contained in the DisplayGroupInstance object. This method is available only for DisplayGroupInstance objects that are members of the DisplayGroupInstance repository member of the *OdbDisplay* object.

Arguments

None.

Return value

A Dictionary object.

Exceptions

None.

setValues(...)

This method modifies the DisplayGroupInstance object. The `setValues` method is available only for DisplayGroupInstance objects that are members of the DisplayGroupInstance repository member of the *OdbDisplay* object.

Required arguments

None.

Optional arguments

lockOptions A Boolean specifying whether the display options stored on the DisplayGroupInstance object should be synchronized with changes to the viewport display options. This member is available only for DisplayGroupInstance objects that are members of the DisplayGroupInstance repository member of the *OdbDisplay* object. The default value is OFF.

Return value

`None.`

Exceptions

None.

Members

The DisplayGroupInstance object can have the following members:

name A String specifying the repository key.

lockOptions A Boolean specifying whether the display options stored on the DisplayGroupInstance object should be synchronized with changes to the viewport display options. This member is available only for DisplayGroupInstance objects that are members of the DisplayGroupInstance repository member of the *OdbDisplay* object. The default value is OFF.

odbDisplayOptions An *OdbDisplayOptions* object specifying this member is available only for DisplayGroupInstance objects that are members of the DisplayGroupInstance repository member of the *OdbDisplay* object.

DisplayGroupInstanceRepository object

The DisplayGroupInstanceRepository object stores *DisplayGroupInstance* objects. In addition to all the standard Python repository methods, the *DisplayGroupInstance* repository defines additional methods as described below.

Access

```
import visualization
session.viewports[name].layers[name].odbDisplay.displayGroupInstances
session.viewports[name].odbDisplay.displayGroupInstances
```

`syncOptions(...)`

This method synchronizes the display options stored on the *OdbDisplay* object with the display options stored on the *DisplayGroupInstance* object.

Required arguments

name A String specifying the repository key.

Optional arguments

updateInstances A Boolean specifying whether to synchronize the display options on all the *DisplayGroupInstance* objects stored in the DisplayGroupInstanceRepository for which *lockOptions* is OFF. The default value of *updateInstances* is ON.

Return value

`None.`

Exceptions

None.

Members

The DisplayGroupInstanceRepository object has no members.

Leaf object

Leaf objects are used to specify the items in a display group. Leaf objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

Leaf objects have similarities to Set objects; however, Leaf objects are evaluated when the DisplayGroup expression is evaluated, and they can have SymbolicConstant values (which are also evaluated when the DisplayGroup expression is evaluated).

Access

```
import displayGroupMdbToolset
import displayGroupOdbToolset
```

Leaf(...)

This method creates a Leaf object.

Path

```
Leaf
```

Required arguments

leafType A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

Optional arguments

None.

Return value

A Leaf object.

Exceptions

None.

Members

The Leaf object has members with the same names and descriptions as the arguments to the *Leaf* method.

LeafFromConstraintNames object

The LeafFromConstraintNames object can be used whenever a Leaf object is expected as an argument.

A *Leaf object* is used used to specify the items in a display group. Leaf objects are constructed as temporary objects that are used as arguments to DisplayGroup (*DisplayGroup object*) commands.

The LeafFromConstraintNames object is derived from the Leaf object.

Access

```
import displayGroupOdbToolset
```

LeafFromConstraintNames(...)

This method creates a Leaf object from a sequence of constraint objects. Leaf objects specify the items in a display group.

Path

```
LeafFromConstraintNames
```

Required arguments

name A sequence of tuples of name objects.

type A SymbolicConstant specifying the Leaf type. Possible values are TIE, SHELL_TO_SOLID_COUPLING, DISTRIBUTING_COUPLING, KINEMATIC_COUPLING, RIGID_BODY, and MPC.

Optional arguments

None.

Return value

A LeafFromConstraintNames object.

Exceptions

None.

Members

The LeafFromConstraintNames object has members with the same names and descriptions as the arguments to the *LeafFromConstraintNames* method.

In addition, the LeafFromConstraintNames object has the following member:

leafType A SymbolicConstant specifying the leaf type. Possible values are TIE, SHELL_TO_SOLID_COUPLING, DISTRIBUTING_COUPLING, KINEMATIC_COUPLING, RIGID_BODY, and MPC.

LeafFromDatums object

The LeafFromDatums object can be used whenever a *Leaf* object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromDatums object is derived from the *Leaf* object.

Access

```
import displayGroupMdbToolset
```

LeafFromDatums(...)

This method creates a *Leaf* object from a sequence of datum objects. Leaf objects specify the items in a display group.

Path

```
LeafFromDatums
```

Required arguments

datumSeq A sequence of datum objects.

Optional arguments

None.

Return value

A LeafFromDatums object.

Exceptions

None.

Members

The LeafFromDatums object has the following member:

leafType A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromDisplayGroup object

The LeafFromDisplayGroup object can be used whenever a *Leaf* object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromDisplayGroup object is derived from the *Leaf* object.

Access

```
import displayGroupMdbToolset
import displayGroupOdbToolset
```

LeafFromDisplayGroup(...)

This method creates a *Leaf* object from a sequence of Display Group objects.

Path

```
LeafFromDisplayGroup
```

Required arguments

displayGroup — A *DisplayGroupArray* object.

Optional arguments

None.

Return value

A LeafFromDisplayGroup object.

Exceptions

None.

Members

The LeafFromDisplayGroup object has members with the same names and descriptions as the arguments to the *LeafFromDisplayGroup* method.

In addition, the LeafFromDisplayGroup object has the following member:

leafType — A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromElementLabels object

The LeafFromElementLabels object can be used whenever a *Leaf* object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromElementLabels object is derived from the *Leaf* object.

Access

```
import displayGroupOdbToolset
```

LeafFromElementLabels(...)

This method creates a *Leaf* object from a sequence of element labels that belong to a single part instance.

Path

```
LeafFromElementLabels
```

Required arguments

partInstanceName A String specifying the name of the part instance to which *elementLabels* refers.

elementLabels A sequence of Strings specifying expressions that denote element labels. The expression can be any of the following:

- An Int specifying a single element label; for example, `1`.
- A String specifying a single element label; for example, `'7'`.
- A String specifying a sequence of element labels; for example, `'3:5'` and `'3:15:3'`.

Optional arguments

None.

Return value

A LeafFromElementLabels object.

Exceptions

None.

Members

The LeafFromElementLabels object has members with the same names and descriptions as the arguments to the *LeafFromElementLabels* method.

In addition, the LeafFromElementLabels object has the following member:

leafType A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromElementSets object

The LeafFromElementSets object can be used whenever a *Leaf* object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromElementSets object is derived from the *Leaf* object.

Access

```
import displayGroupOdbToolset
```

LeafFromElementSets(...)

This method creates a *Leaf* object from a sequence of element sets.

Path

```
LeafFromElementSets
```

Required arguments

elementSets	A sequence of Strings specifying element sets or a String specifying a single element set.

Optional arguments

None.

Return value

A LeafFromElementSets object.

Exceptions

None.

Members

The LeafFromElementSets object has members with the same names and descriptions as the arguments to the *LeafFromElementSets* method.

In addition, the LeafFromElementSets object has the following member:

leafType	A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromElementVarRange object

The LeafFromElementVarRange object can be used whenever a Leaf object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromElementVarRange object is derived from the *Leaf* object.

Access

```
import displayGroupOdbToolset
```

LeafFromElementVarRange(...)

This method creates a *Leaf* object from elements with values lying in a variable range.

Path

```
LeafFromElementVarRange
```

Required arguments

None.

Optional arguments

minimumRange A Float specifying the minimum value for the variable range. The default value is −3.40282346639E38.

maximumRange A Float specifying the maximum value for the variable range. The default value is 3.40282346639e+038.

insideRange A Boolean specifying the method used to evaluate the range. If *insideRange*=ON, the range falls inside the specified minimum and maximum values. The default value is ON.

Return value

A LeafFromElementVarRange object.

Exceptions

None.

Members

The LeafFromElementVarRange object has members with the same names and descriptions as the arguments to the *LeafFromElementVarRange* method.

In addition, the LeafFromElementVarRange object has the following member:

leafType A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromGeometry object

The LeafFromGeometry object can be used whenever a *Leaf* object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromGeometry object is derived from the *Leaf* object.

Access

```
import displayGroupMdbToolset
```

LeafFromGeometry(...)

This method creates a Leaf object from a sequence of edge, face and cell geometry objects. Any combination of edge, face or cell arguments is allowed however the arguments must specify at least one object--it is not permissible to create an empty leaf.

Path

```
LeafFromGeometry
```

Required arguments

None.

Optional arguments

edgeSeq	A sequence of geometry edges.
faceSeq	A sequence of geometry faces.
cellSeq	A sequence of geometry cells.

Return value

A LeafFromGeometry object.

Exceptions

If at least one of the sequences is not passed to this method:	Cannot define empty leaf.

Members

The LeafFromGeometry object has the following member:

leafType	A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromInstance object

The LeafFromInstance object can be used whenever a *Leaf* object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromInstance object is derived from the *Leaf* object.

Access

```
import displayGroupMdbToolset
```

LeafFromInstance(...)

This method creates a Leaf object from a sequence of part instance objects.

Path

```
LeafFromInstance
```

Required arguments

instances A *PartInstance* object or a Sequence of *PartInstance* objects.

Optional arguments

None.

Return value

A LeafFromInstance object.

Exceptions

If an invalid argument is passed to this method: Cannot define empty leaf.

Members

The LeafFromInstance object has the following member:

leafType A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromInstanceElementLabels object

The LeafFromInstanceElementLabels object can be used whenever a *Leaf* object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromInstanceElementLabels object is derived from the *Leaf* object.

Access

```
import displayGroupMdbToolset
```

LeafFromInstanceElementLabels(...)

This method creates a *Leaf* object from a sequence of Strings specifying the element labels. Leaf objects specify the items in a display group.

Path

```
LeafFromInstanceElementLabels
```

Required arguments

elementLabels
A sequence of sequences specifying element labels. Each inner sequence consists of a *PartInstance* object followed by a sequence of Strings specifying element labels.

Optional arguments

None.

Return value

A LeafFromInstanceElementLabels object.

Exceptions

None.

Members

The LeafFromInstanceElementLabels object has the following member:

leafType
A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromInstanceNodeLabels object

The LeafFromInstanceNodeLabels object can be used whenever a *Leaf* object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromInstanceNodeLabels object is derived from the *Leaf* object.

Access

```
import displayGroupMdbToolset
```

LeafFromInstanceNodeLabels(...)

This method creates a *Leaf* object from a sequence of Strings specifying the node labels. Leaf objects specify the items in a display group.

Path

```
LeafFromInstanceNodeLabels
```

Required arguments

nodeLabels A sequence of sequences specifying node labels. Each inner sequence consists of a *PartInstance* object followed by a sequence of Strings specifying node labels.

Optional arguments

None.

Return value

A LeafFromInstanceNodeLabels object.

Exceptions

None.

Members

The LeafFromInstanceNodeLabels object has the following member:

leafType A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromMeshElementLabels object

The LeafFromMeshElementLabels object can be used whenever a *Leaf* object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromMeshElementLabels object is derived from the *Leaf* object.

Access

```
import displayGroupMdbToolset
```

LeafFromMeshElementLabels(...)

This method creates a *Leaf* object from a sequence of mesh element objects. Leaf objects specify the items in a display group.

Path

```
LeafFromMeshElementLabels
```

Required arguments

elementSeq A sequence of *MeshElement* objects specifying elements.

Optional arguments

None.

Return value

A LeafFromMeshElementLabels object.

Exceptions

None.

Members

The LeafFromMeshElementLabels object has the following member:

leafType A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromMeshNodeLabels object

The LeafFromMeshNodeLabels object can be used whenever a *Leaf* object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromMeshNodeLabels object is derived from the *Leaf* object.

Access

```
import displayGroupMdbToolset
```

LeafFromMeshNodeLabels(...)

This method creates a *Leaf* object from a sequence of mesh node objects. Leaf objects specify the items in a display group.

Path

```
LeafFromMeshNodeLabels
```

Required arguments

nodeSeq A sequence of *MeshNode* objects specifying nodes.

Optional arguments

None.

Return value

A LeafFromMeshNodeLabels object.

Exceptions

None.

Members

The LeafFromMeshNodeLabels object has the following member:

leafType A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromMeshSurfaceSets object

The LeafFromMeshSurfaceSets object can be used whenever a *Leaf* object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromMeshSurfaceSets object is derived from the *Leaf* object.

Access

```
import displayGroupMdbToolset
```

LeafFromMeshSurfaceSets(...)

This method creates a *Leaf* object from a sequence of surface sets.

Path

```
LeafFromMeshSurfaceSets
```

Required arguments

surfaceSets A sequence of Surface objects.

Optional arguments

None.

Return value

A LeafFromMeshSurfaceSets object.

Exceptions

None.

Members

The LeafFromMeshSurfaceSets object has the following member:

leafType A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromModelElemLabels object

The LeafFromModelElemLabels object can be used whenever a Leaf object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromModelElemLabels object is derived from the *Leaf* object.

Access

```
import displayGroupOdbToolset
```

LeafFromModelElemLabels(...)

This method creates a *Leaf* object from a sequence of element labels spanning several part instances.

Path

```
LeafFromModelElemLabels
```

Required arguments

elementLabels A sequence of Strings specifying expressions that denote element labels per part instance in the model. Each part instance element expression is a sequence of a String specifying the part instance name and a sequence of element expressions; for example, `(('partInstance1',(1,'7','3:15;3'),), ('partInstance2','8'),))`. The element expressions can be any of the following:

- An Int specifying a single element label; for example, `1`.
- A String specifying a single element label; for example, `'7'`.
- A String specifying a sequence of element labels; for example, `'3:5'` and `'3:15:3'`.

Optional arguments

None.

Return value

A LeafFromModelElemLabels object.

Exceptions

None.

Members

The LeafFromModelElemLabels object has members with the same names and descriptions as the arguments to the *LeafFromModelElemLabels* method.

In addition, the LeafFromModelElemLabels object has the following member:

leafType

A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromModelNodeLabels object

The LeafFromModelNodeLabels object can be used whenever a Leaf object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromModelNodeLabels object is derived from the *Leaf* object.

Access

```
import displayGroupOdbToolset
```

LeafFromModelNodeLabels(...)

This method creates a *Leaf* object from a sequence of node labels spanning several part instances.

Path

```
LeafFromModelNodeLabels
```

Required arguments

nodeLabels A sequence of Strings specifying expressions that denote node labels per part instance in the model. Each part instance node expression is a sequence of a String specifying the part instance name and a sequence of node expressions; for example, `(('partInstance1',(1,'7','3:15;3'),),('partInstance2','8'),))`. The node expressions can be any of the following:

- An Int specifying a single node label; for example, `1`.
- A String specifying a single node label; for example, `'7'`.
- A String specifying a sequence of node labels; for example, `'3:5'` and `'3:15:3'`.

Optional arguments

None.

Return value

A LeafFromModelNodeLabels object.

Exceptions

None.

Members

The LeafFromModelNodeLabels object has members with the same names and descriptions as the arguments to the *LeafFromModelNodeLabels* method.

In addition, the LeafFromModelNodeLabels object has the following member:

leafType A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromNodeLabels object

The LeafFromNodeLabels object can be used whenever a *Leaf* object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromNodeLabels object is derived from the *Leaf* object.

Access

```
import displayGroupOdbToolset
```

LeafFromNodeLabels(...)

This method creates a *Leaf* object from a sequence of node labels that belong to a single part instance.

Path

```
LeafFromNodeLabels
```

Required arguments

partInstanceName A String specifying the name of the part instance to which *nodeLabels* refers.

nodeLabels A sequence of Strings specifying expressions that denote node labels. The expression can be any of the following:

- An Int specifying a single node label; for example, `1`.
- A String specifying a single node label; for example, `'7'`.
- A String specifying a sequence of node labels; for example, `'3:5'` and `'3:15:3'`.

Optional arguments

None.

Return value

A LeafFromNodeLabels object.

Exceptions

None.

Members

The LeafFromNodeLabels object has members with the same names and descriptions as the arguments to the *LeafFromNodeLabels* method.

In addition, the LeafFromNodeLabels object has the following member:

leafType A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromNodeSets object

The LeafFromNodeSets object can be used whenever a *Leaf* object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromNodeSets object is derived from the *Leaf* object.

Access

```
import displayGroupOdbToolset
```

LeafFromNodeSets(...)

This method creates a *Leaf* object from a sequence of node sets.

Path

```
LeafFromNodeSets
```

Required arguments

nodeSets A sequence of Strings specifying node sets or a String specifying a single node set.

Optional arguments

None.

Return value

A LeafFromNodeSets object.

Exceptions

None.

Members

The LeafFromNodeSets object has members with the same names and descriptions as the arguments to the *LeafFromNodeSets* method.

In addition, the LeafFromNodeSets object has the following member:

leafType A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromNodeVarRange object

The LeafFromNodeVarRange object can be used whenever a Leaf object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromNodeVarRange object is derived from the *Leaf* object.

Access

```
import displayGroupOdbToolset
```

LeafFromNodeVarRange(...)

This method creates a *Leaf* object from nodes with values lying in a variable range.

Path

```
LeafFromNodeVarRange
```

Required arguments

None.

Optional arguments

minimumRange A Float specifying the minimum value for the variable range. The default value is −3.40282346639E38.

maximumRange A Float specifying the maximum value for the variable range. The default value is 3.40282346639e+038.

insideRange A Boolean specifying the method used to evaluate the range. If *insideRange*=ON, the range falls inside the specified minimum and maximum values. The default value is ON.

Return value

A LeafFromNodeVarRange object.

Exceptions

None.

Members

The LeafFromNodeVarRange object has members with the same names and descriptions as the arguments to the *LeafFromNodeVarRange* method.

In addition, the LeafFromNodeVarRange object has the following member:

leafType A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromOdbElementLayups object

The LeafFromOdbElementLayups object can be used whenever a *Leaf* object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromOdbElementLayups object is derived from the *Leaf* object.

Access

```
import displayGroupOdbToolset
```

LeafFromOdbElementLayups(...)

This method creates a *Leaf* object from a sequence of Strings specifying layup names. Leaf objects specify the items in a display group.

Path

```
LeafFromOdbElementLayups
```

Required arguments

elementLayups A sequence of Strings specifying element layups.

Optional arguments

None.

Return value

A LeafFromOdbElementLayups object.

Exceptions

None.

Members

The LeafFromOdbElementLayups object has the following member:

leafType A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromOdbElementMaterials object

The LeafFromOdbElementMaterials object can be used whenever a *Leaf* object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromOdbElementMaterials object is derived from the *Leaf* object.

Access

```
import displayGroupOdbToolset
```

LeafFromOdbElementMaterials(...)

This method creates a *Leaf* object from a sequence of Strings specifying material names. Leaf objects specify the items in a display group.

Path

```
LeafFromOdbElementMaterials
```

Required arguments

elementMaterials A sequence of Strings specifying element materials.

Optional arguments

None.

Return value

A LeafFromOdbElementMaterials object.

Exceptions

None.

Members

The LeafFromOdbElementMaterials object has the following member:

leafType A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromOdbElementPick object

The LeafFromOdbElementPick object can be used whenever a *Leaf* object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromOdbElementPick object is derived from the *Leaf* object.

Access

```
import displayGroupOdbToolset
```

LeafFromOdbElementPick(...)

This method creates a *Leaf* object from a tuple containing machine readable, compact strings defining the elements picked for each part instance. Leaf objects specify the items in a display group.

Path

```
LeafFromOdbElementPick
```

Required arguments

elementPick A sequence of tuples of the form [part name, entity count, machine readable pick strings].

Optional arguments

None.

Return value

A LeafFromOdbElementPick object.

Exceptions

None.

Members

The LeafFromOdbElementPick object has the following member:

leafType A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromOdbElementPlies object

The LeafFromOdbElementPlies object can be used whenever a *Leaf* object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromOdbElementPlies object is derived from the *Leaf* object.

Access

```
import displayGroupOdbToolset
```

LeafFromOdbElementPlies(...)

This method creates a *Leaf* object from a sequence of Strings specifying ply names. Leaf objects specify the items in a display group.

Path

```
LeafFromOdbElementPlies
```

Required arguments

elementPlies A sequence of Strings specifying element plies.

Optional arguments

None.

Return value

A LeafFromOdbElementPlies object.

Exceptions

None.

Members

The LeafFromOdbElementPlies object has the following member:

leafType A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromOdbElementSections object

The LeafFromOdbElementSections object can be used whenever a *Leaf* object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromOdbElementSections object is derived from the *Leaf* object.

Access

```
import displayGroupOdbToolset
```

LeafFromOdbElementSections(...)

This method creates a *Leaf* object from a sequence of Strings specifying section names. Leaf objects specify the items in a display group.

Path

```
LeafFromOdbElementSections
```

Required arguments

elementSections A sequence of Strings specifying element Sections.

Optional arguments

None.

Return value

A LeafFromOdbElementSections object.

Exceptions

None.

Members

The LeafFromOdbElementSections object has the following member:

leafType A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromOdbElementTypes object

The LeafFromOdbElementTypes object can be used whenever a *Leaf* object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromOdbElementTypes object is derived from the *Leaf* object.

Access

```
import displayGroupOdbToolset
```

LeafFromOdbElementTypes(...)

This method creates a *Leaf* object from a sequence of Strings specifying element names. Leaf objects specify the items in a display group.

Path

```
LeafFromOdbElementTypes
```

Required arguments

elementTypes A sequence of Strings specifying element Types.

Optional arguments

None.

Return value

A LeafFromOdbElementTypes object.

Exceptions

None.

Members

The LeafFromOdbElementTypes object has the following member:

leafType A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromOdbNodePick object

The LeafFromOdbNodePick object can be used whenever a *Leaf* object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromOdbNodePick object is derived from the *Leaf* object.

Access

```
import displayGroupOdbToolset
```

LeafFromOdbNodePick(...)

This method creates a *Leaf* object from a tuple containing machine readable, compact strings defining the nodes picked for each part instance. Leaf objects specify the items in a display group.

Path

```
LeafFromOdbNodePick
```

Required arguments

nodePick A sequence of tuples of the form [part name, entity count, machine readable pick strings].

Optional arguments

None.

Return value

A LeafFromOdbNodePick object.

Exceptions

None.

Members

The LeafFromOdbNodePick object has the following member:

leafType A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromOdbEdgePick object

The LeafFromOdbEdgePick object can be used whenever a *Leaf* object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromOdbEdgePick object is derived from the *Leaf* object.

Access

```
import displayGroupOdbToolset
```

LeafFromOdbEdgePick(...)

This method creates a *Leaf* object from a tuple containing machine readable, compact strings defining the edges picked for each part instance. Leaf objects specify the items in a display group.

Path

```
LeafFromOdbEdgePick
```

Required arguments

edgePick A sequence of tuples of the form [part name, entity count, machine readable pick strings].

Optional arguments

None.

Return value

A LeafFromOdbEdgePick object.

Exceptions

None.

Members

The LeafFromOdbEdgePick object has the following member:

leafType A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromPartElementLabels object

The LeafFromPartElementLabels object can be used whenever a *Leaf* object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromPartElementLabels object is derived from the *Leaf* object.

Access

```
import displayGroupMdbToolset
```

LeafFromPartElementLabels(...)

This method creates a *Leaf* object from a sequence of Strings specifying element labels. Leaf objects specify the items in a display group.

Path

```
LeafFromPartElementLabels
```

Required arguments

part A *Part* object.

elementLabels A sequence of Strings specifying element labels.

Optional arguments

None.

Return value

A LeafFromPartElementLabels object.

Exceptions

None.

Members

The LeafFromPartElementLabels object has the following member:

leafType A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromPartInstance object

The LeafFromPartInstance object can be used whenever a *Leaf* object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromPartInstance object is derived from the *Leaf* object.

Access

```
import displayGroupOdbToolset
```

LeafFromPartInstance(...)

This method creates a *Leaf* object from a list of part instance names.

Path

```
LeafFromPartInstance
```

Required arguments

partInstanceName	A sequence of Strings specifying the names of the part instances.

Optional arguments

None.

Return value

A LeafFromPartInstance object.

Exceptions

None.

Members

The LeafFromPartInstance object has members with the same names and descriptions as the arguments to the *LeafFromPartInstance* method.

In addition, the LeafFromPartInstance object has the following member:

leafType	A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromPartNodeLabels object

The LeafFromPartNodeLabels object can be used whenever a *Leaf* object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromPartNodeLabels object is derived from the *Leaf* object.

Access

```
import displayGroupMdbToolset
```

LeafFromPartNodeLabels(...)

This method creates a *Leaf* object from a sequence of Strings specifying node labels. Leaf objects specify the items in a display group.

Path

```
LeafFromPartNodeLabels
```

Required arguments

part A *Part* object.

nodeLabels A sequence of Strings specifying node labels.

Optional arguments

None.

Return value

A LeafFromPartNodeLabels object.

Exceptions

None.

Members

The LeafFromPartNodeLabels object has the following member:

leafType A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromReferencePoint object

The LeafFromReferencePoint object can be used whenever a *Leaf* object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromReferencePoint object is derived from the *Leaf* object.

Access

```
import displayGroupMdbToolset
```

LeafFromReferencePoint(...)

This method creates a *Leaf* object from a sequence of ReferencePoint objects.

Path

```
LeafFromReferencePoint
```

Required arguments

refPtSeq A sequence of Reference Point objects.

Optional arguments

None.

Return value

A LeafFromReferencePoint object.

Exceptions

None.

Members

The LeafFromReferencePoint object has the following member:

leafType A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromSets object

The LeafFromSets object can be used whenever a *Leaf* object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromSets object is derived from the *Leaf* object.

Access

```
import displayGroupMdbToolset
```

LeafFromSets(...)

This method creates a *Leaf* object from a sequence of Set objects.

Path

```
LeafFromSets
```

Required arguments

sets A sequence of Set objects.

Optional arguments

None.

Return value

A LeafFromSets object.

Exceptions

None.

Members

The LeafFromSets object has the following member:

leafType A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromSurfaceSets object

The LeafFromSurfaceSets object can be used whenever a *Leaf* object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromSurfaceSets object is derived from the *Leaf* object.

Access

```
import displayGroupOdbToolset
```

LeafFromSurfaceSets(...)

This method creates a *Leaf* object from a sequence of surface sets.

Path

```
LeafFromSurfaceSets
```

Required arguments

surfaceSets A sequence of Strings specifying surface sets, or a String specifying a single surface set.

Optional arguments

None.

Return value

A LeafFromSurfaceSets object.

Exceptions

None.

Members

The LeafFromSurfaceSets object has members with the same names and descriptions as the arguments to the *LeafFromSurfaceSets* method.

In addition, the LeafFromSurfaceSets object has the following member:

leafType A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

LeafFromSurfaceVarRange object

The LeafFromSurfaceVarRange object can be used whenever a Leaf object is expected as an argument. *Leaf* objects are used to specify the items in a display group. *Leaf* objects are constructed as temporary objects, which are then used as arguments to *DisplayGroup* commands.

The LeafFromSurfaceVarRange object is derived from the *Leaf* object.

Access

```
import displayGroupOdbToolset
```

LeafFromSurfaceVarRange(...)

This method creates a *Leaf* object from surfaces with values lying in a variable range.

Path

```
LeafFromSurfaceVarRange
```

Required arguments

None.

Optional arguments

minimumRange A Float specifying the minimum value for the variable range. The default value is −3.40282346639E38.

maximumRange A Float specifying the maximum value for the variable range. The default value is 3.40282346639e+038.

insideRange A Boolean specifying the method used to evaluate the range. If *insideRange*=ON, the range falls inside the specified minimum and maximum values. The default value is ON.

Return value

A LeafFromSurfaceVarRange object.

Exceptions

None.

Members

The LeafFromSurfaceVarRange object has members with the same names and descriptions as the arguments to the *LeafFromSurfaceVarRange* method.

In addition, the LeafFromSurfaceVarRange object has the following member:

leafType A SymbolicConstant specifying the leaf type. Possible values are EMPTY_LEAF, DEFAULT_MODEL, ALL_ELEMENTS, ALL_NODES, and ALL_SURFACES.

Display Options commands

Display options commands are used to store settings that specify how assemblies and parts are to be displayed and how annotations are to be rendered in a particular viewport.

In this section:

- *AssemblyDisplayOptions object*
- *BCDisplayOptions object*
- *ConstraintDisplayOptions object*
- *EngineeringFeatureDisplayOptions object*
- *PredefinedFieldDisplayOptions object*
- *GeometryDisplayOptions object*
- *GeometricRestrictionDisplayOptions object*
- *GraphicsInfo object*
- *GraphicsOptions object*
- *InteractionDisplayOptions object*
- *Light object*
- *LightOptions object*
- *LoadDisplayOptions object*
- *MeshDisplayOptions object*
- *OptimizationTaskDisplayOptions object*
- *PartDisplayOptions object*
- *StopConditionDisplayOptions object*
- *SymbolDisplayOptions object*
- *ViewportAnnotationOptions object*

AssemblyDisplayOptions object

The AssemblyDisplayOptions object stores settings that specify how assemblies are to be displayed in a particular viewport. The AssemblyDisplayOptions object has no constructor. When you create a new viewport, the settings are copied from the current viewport.

Access

```
import assembly
session.viewports[name].assemblyDisplay
session.viewports[name].layers[name].assemblyDisplay
```

setValues(...)

This method modifies the AssemblyDisplayOptions object.

Required arguments

None.

Optional arguments

visibleInstances
A sequence of Strings specifying the names of the part instances that are visible in the viewport. The default value is an empty sequence.

step
A String specifying the step for which objects are to be displayed. Possible values are any valid step name. The default value is "Initial".

renderStyle
A SymbolicConstant specifying how the image in the viewport is rendered. Possible values are WIREFRAME, HIDDEN, SHADED, and FILLED. The default value is WIREFRAME.

mesh
A Boolean specifying whether the mesh is shown. The default value is OFF.

loads
A Boolean specifying whether loads are shown. The default value is OFF.

bcs
A Boolean specifying whether boundary conditions are shown. The default value is OFF.

interactions
A Boolean specifying whether interactions are shown. The default value is OFF.

constraints
A Boolean specifying whether constraints are shown. The default value is OFF.

connectors
A Boolean specifying whether connectors are shown. The default value is OFF.

cnxEndPoints
A Boolean specifying whether the connector end points are shown. This member is applicable only if *connectors*=ON. The default value is ON.

cnxLocalAxes
A Boolean specifying whether the connector local coordinate system axes are shown. This member is applicable only if *connectors*=ON. The default value is ON.

cnxTypeLabels
A Boolean specifying whether the connector section type labels are shown. This member is applicable only if *connectors*=ON. The default value is ON.

cnxTagDisplay
A Boolean specifying whether the tag information is displayed along with the connector section type labels. This member is applicable only if *connectors*=ON and if *cnxTypeLabels*=ON. The default value is OFF.

predefinedFields
A Boolean specifying whether fields and initial conditions are shown. The default value is OFF.

visibleDisplayGroups
A sequence of *DisplayGroup* objects specifying the DisplayGroups visible in the viewport. Currently the sequence can contain a maximum of one *DisplayGroup* object. The default value is an empty sequence.

engineeringFeatures
A Boolean specifying whether to display engineering features. The default value is OFF.

renderBeamProfiles
A Boolean specifying whether to render the beam profiles. The default value is OFF.

beamScaleFactor
A Float specifying the beam profile scale factor. The beamScaleFactor must be greater than zero. The default value is 1.0.

optimizationTasks
A Boolean specifying whether optimization tasks are shown. The default value is OFF.

geometricRestrictions
A Boolean specifying whether geometric restrictions are shown. The default value is OFF.

stopConditions
A Boolean specifying whether stop conditions are shown. The default value is OFF.

Return value
`None.`

Exceptions
RangeError.

Members
The AssemblyDisplayOptions object can have the following members:

bcs
A Boolean specifying whether boundary conditions are shown. The default value is OFF.

connectors
A Boolean specifying whether connectors are shown. The default value is OFF.

cnxEndPoints
A Boolean specifying whether the connector end points are shown. This member is applicable only if *connectors*=ON. The default value is ON.

cnxLocalAxes

A Boolean specifying whether the connector local coordinate system axes are shown. This member is applicable only if *connectors*=ON. The default value is ON.

cnxTypeLabels

A Boolean specifying whether the connector section type labels are shown. This member is applicable only if *connectors*=ON. The default value is ON.

cnxTagDisplay

A Boolean specifying whether the tag information is displayed along with the connector section type labels. This member is applicable only if *connectors*=ON and if *cnxTypeLabels*=ON. The default value is OFF.

constraints

A Boolean specifying whether constraints are shown. The default value is OFF.

engineeringFeatures

A Boolean specifying whether to display engineering features. The default value is OFF.

geometricRestrictions

A Boolean specifying whether geometric restrictions are shown. The default value is OFF.

renderBeamProfiles

A Boolean specifying whether to render the beam profiles. The default value is OFF.

beamScaleFactor

A Float specifying the beam profile scale factor. The beamScaleFactor must be greater than zero. The default value is 1.0.

predefinedFields

A Boolean specifying whether fields and initial conditions are shown. The default value is OFF.

interactions

A Boolean specifying whether interactions are shown. The default value is OFF.

loads

A Boolean specifying whether loads are shown. The default value is OFF.

mesh

A Boolean specifying whether the mesh is shown. The default value is OFF.

optimizationTasks

A Boolean specifying whether optimization tasks are shown. The default value is OFF.

stopConditions

A Boolean specifying whether stop conditions are shown. The default value is OFF.

renderStyle

A SymbolicConstant specifying how the image in the viewport is rendered. Possible values are WIREFRAME, HIDDEN, SHADED, and FILLED. The default value is WIREFRAME.

bcOptions

A *BCDisplayOptions* object.

constraintOptions

A *ConstraintDisplayOptions* object.

displayGroup

A *DisplayGroup* object specifying the current display group and referring to an object in the *displayGroups* member of *Session*.

displayGroupInstances

A repository of *DisplayGroupInstance* objects.

engineeringFeatureOptions

An *EngineeringFeatureDisplayOptions* object.

predefinedFieldOptions

A *PredefinedFieldDisplayOptions* object.

geometricRestrictionOptions

A *GeometricRestrictionDisplayOptions* object.

geometryOptions

A *GeometryDisplayOptions* object.

interactionOptions

An *InteractionDisplayOptions* object.

loadOptions

A *LoadDisplayOptions* object.

meshOptions

A *MeshDisplayOptions* object.

optimizationTaskOptions

An *OptimizationTaskDisplayOptions* object.

stopConditionOptions

A *StopConditionDisplayOptions* object.

symbolOptions

A *SymbolDisplayOptions* object.

visibleInstances

A tuple of Strings specifying the names of the part instances that are visible in the viewport. The default value is an empty sequence.

step

A String specifying the step for which objects are to be displayed. Possible values are any valid step name. The default value is "Initial".

BCDisplayOptions object

The BCDisplayOptions object stores settings that specify how assemblies are to be displayed in a particular viewport when

```
session.viewports[name].assemblyDisplay.bcs=ON
```

The BCDisplayOptions object has no constructor. When you create a new viewport, the settings are copied from the current viewport.

Access

```
session.viewports[name].assemblyDisplay.bcOptions
session.viewports[name].layers[name].assemblyDisplay.bcOptions
```

`setValues(...)`

This method modifies the BCDisplayOptions object.

Required arguments

None.

Optional arguments

displacement
A Boolean specifying whether displacement symbols are shown. The default value is ON.

velocity
A Boolean specifying whether velocity symbols are shown. The default value is ON.

acceleration
A Boolean specifying whether acceleration symbols are shown. The default value is ON.

symmetry
A Boolean specifying whether symmetry symbols are shown. The default value is ON.

antiSymmetry
A Boolean specifying whether anti- symmetry symbols are shown. The default value is ON.

temperature
A Boolean specifying whether temperature symbols are shown. The default value is ON.

porePressure
A Boolean specifying whether pore pressure symbols are shown. The default value is ON.

fluidCavityPressure
A Boolean specifying whether fluid cavity pressure symbols are shown. The default value is ON.

acousticPressure
A Boolean specifying whether acoustic pressure symbols are shown. The default value is ON.

electricPotential A Boolean specifying whether electric potential symbols are shown. The default value is ON.

concentration A Boolean specifying whether concentration mass diffusion symbols are shown. The default value is ON.

encastre A Boolean specifying whether encastre symbols are shown. The default value is ON.

pinned A Boolean specifying whether pinned symbols are shown. The default value is ON.

Return value

`None.`

Exceptions

None.

Members

The BCDisplayOptions object has members with the same names and descriptions as the arguments to the *setValues* method.

ConstraintDisplayOptions object

The ConstraintDisplayOptions object stores settings that specify how assemblies are to be displayed in a particular viewport when

```
session.viewports[name].assemblyDisplay.constraints=ON
```

The ConstraintDisplayOptions object has no constructor. When you create a new viewport, the settings are copied from the current viewport.

Access

```
session.viewports[name].assemblyDisplay.constraintOptions
session.viewports[name].layers[name].assemblyDisplay.constraintOptions
```

`setValues(...)`

This method modifies the ConstraintDisplayOptions object.

Required arguments

None.

Optional arguments

constraintEquation
A Boolean specifying whether constraint equation symbols are shown. The default value is ON.

tieConstraint
A Boolean specifying whether tie constraint symbols are shown. The default value is ON.

rigidBodyConstraint
A Boolean specifying whether rigid body constraint symbols are shown. The default value is ON.

displayBodyConstraint
A Boolean specifying whether display body constraint symbols are shown. The default value is ON.

couplingConstrain
A Boolean specifying whether coupling constraint symbols are shown. The default value is ON.

Return value

`None.`

Exceptions

None.

Members

The ConstraintDisplayOptions object has members with the same names and descriptions as the arguments to the *setValues* method.

EngineeringFeatureDisplayOptions object

The EngineeringFeatureDisplayOptions object stores settings that specify how assemblies are to be displayed in a particular viewport when

```
session.viewports[name].assemblyDisplay.engineeringFeatures=ON
```

The EngineeringFeatureDisplayOptions object has no constructor. When you create a new viewport, the settings are copied from the current viewport.

Access

```
session.viewports[name].assemblyDisplay.engineeringFeatureOptions
session.viewports[name].layers[name].assemblyDisplay\
.engineeringFeatureOptions
import part
session.viewports[name].layers[name].partDisplay\
.engineeringFeatureOptions
session.viewports[name].partDisplay.engineeringFeatureOptions
```

`setValues(...)`

This method modifies the EngineeringFeatureDisplayOptions object.

Required arguments

None.

Optional arguments

pointMassInertia A Boolean specifying whether point mass inertia symbols are shown. The default value is ON.

nonstructuralMass A Boolean specifying whether nonstructural mass symbols are shown. The default value is ON.

heatCapacitance A Boolean specifying whether heat capacitance symbols are shown. The default value is ON.

contourIntegral A Boolean specifying whether contour integral symbols are shown. The default value is ON.

springToGround A Boolean specifying whether spring-to-ground symbols are shown. The default value is ON.

twoPointSpring A Boolean specifying whether two-point spring symbols are shown. The default value is ON.

Return value

`None.`

Exceptions

RangeError.

Members

The EngineeringFeatureDisplayOptions object has members with the same names and descriptions as the arguments to the *setValues* method.

PredefinedFieldDisplayOptions object

The PredefinedFieldDisplayOptions object stores settings that specify how assemblies are to be displayed in a particular viewport when

```
session.viewports[name].assemblyDisplay.predefinedFields=ON
```

The PredefinedFieldDisplayOptions object has no constructor. When you create a new viewport, the settings are copied from the current viewport.

Access

```
session.viewports[name].assemblyDisplay.predefinedFieldOptions
session.viewports[name].layers[name].assemblyDisplay\
.predefinedFieldOptions
```

`setValues(...)`

This method modifies the PredefinedFieldDisplayOptions object.

Required arguments

None.

Optional arguments

temperatureField
A Boolean specifying whether temperature field symbols are shown. The default value is ON.

velocityField
A Boolean specifying whether translational velocity symbols are shown. The default value is ON.

generalField
A Boolean specifying whether general field symbols are shown. The default value is ON.

stressField
A Boolean specifying whether stress field symbols are shown. The default value is ON.

hardeningField
A Boolean specifying whether hardening field symbols are shown. The default value is ON.

Return value

`None.`

Exceptions

RangeError.

Members

The PredefinedFieldDisplayOptions object has members with the same names and descriptions as the arguments to the *`setValues`* method.

GeometryDisplayOptions object

The GeometryDisplayOptions object stores settings that specify how assemblies are to be displayed in a particular viewport. The GeometryDisplayOptions object has no constructor. When you create a new viewport, the settings are copied from the current viewport.

Access

```
session.viewports[name].assemblyDisplay.geometryOptions
session.viewports[name].layers[name].assemblyDisplay.geometryOptions
session.viewports[name].layers[name].partDisplay.geometryOptions
session.viewports[name].partDisplay.geometryOptions
```

`setValues(...)`

This method modifies the GeometryDisplayOptions object.

Required arguments

None.

Optional arguments

geometryEdgesInShaded
A Boolean specifying whether geometry edges are displayed in shaded mode. The default value is ON.

geometryHiddenEdges
A Boolean specifying whether geometry hidden edges are displayed (dotted) in hidden line mode. The default value is OFF.

geometrySilhouetteEdges
A Boolean specifying whether geometry silhouette edges are displayed. The default value is ON.

datumAxes
A Boolean specifying whether datum axes are shown. The default value is ON.

datumCoordSystems
A Boolean specifying whether datum coordinate systems are shown. The default value is ON.

datumPlanes
A Boolean specifying whether datum planes are shown. The default value is ON.

referencePointLabels
A Boolean specifying whether referencePoint labels are shown. The default value is ON.

referencePointSymbols
A Boolean specifying whether referencePoint symbols are shown. The default value is ON.

referenceRepresentation
A Boolean specifying whether geometry that belongs to the reference representation of the Part or Instance is shown. The default value is OFF.

referenceRepTranslucency A Boolean specifying whether to apply translucency to the geometry that belongs to the reference representation of the Part or Instance. The default value is ON.

Return value

`None.`

Exceptions

RangeError.

Members

The GeometryDisplayOptions object has members with the same names and descriptions as the arguments to the *`setValues`* method.

GeometricRestrictionDisplayOptions object

The GeometricRestrictionDisplayOptions object stores settings that specify how assemblies are to be displayed in a particular viewport when

```
session.viewports[name].assemblyDisplay.geometricRestrictions=ON
```

The GeometricRestrictionDisplayOptions object has no constructor. When you create a new viewport, the settings are copied from the current viewport.

Access

```
session.viewports[name].assemblyDisplay.geometricRestrictionOptions
session.viewports[name].layers[name].assemblyDisplay\
.geometricRestrictionOptions
```

`setValues(...)`

This method modifies the GeometricRestrictionDisplayOptions object.

Required arguments

None.

Optional arguments

drillControl

A Boolean specifying whether drill control geometric restriction symbols are shown. The default value is ON.

fixedRegion

A Boolean specifying whether fixed region geometric restriction symbols are shown. The default value is ON.

frozenArea

A Boolean specifying whether frozen area geometric restriction symbols are shown. The default value is ON.

growth

A Boolean specifying whether growth geometric restriction symbols are shown. The default value is ON.

penetrationCheck

A Boolean specifying whether penetration check geometric restriction symbols are shown. The default value is ON.

shapeDemoldControl

A Boolean specifying whether demold control (shape) geometric restriction symbols are shown. The default value is ON.

designDirection

A Boolean specifying whether design direction geometric restriction symbols are shown. The default value is ON.

shapeMemberSize

A Boolean specifying whether member size (shape) geometric restriction symbols are shown. The default value is ON.

shapePlanarSymmetry A Boolean specifying whether planar symmetry (shape) geometric restriction symbols are shown. The default value is ON.

shapePointSymmetry A Boolean specifying whether point symmetry (shape) geometric restriction symbols are shown. The default value is ON.

shapeRotationalSymmetry A Boolean specifying whether rotational symmetry (shape) geometric restriction symbols are shown. The default value is ON.

stampControl A Boolean specifying whether stamp control geometric restriction symbols are shown. The default value is ON.

slideRegionControl A Boolean specifying whether slide region control geometric restriction symbols are shown. The default value is ON.

topologyCyclicSymmetry A Boolean specifying whether cyclic symmetry geometric restriction symbols are shown. The default value is ON.

topologyDemoldControl A Boolean specifying whether demold control (topology) geometric restriction symbols are shown. The default value is ON.

topologyMemberSize A Boolean specifying whether member size (topology) geometric restriction symbols are shown. The default value is ON.

topologyPlanarSymmetry A Boolean specifying whether planar symmetry (topology) geometric restriction symbols are shown. The default value is ON.

topologyPointSymmetry A Boolean specifying whether point symmetry (topology) geometric restriction symbols are shown. The default value is ON.

topologyRotationalSymmetry A Boolean specifying whether rotational symmetry (topology) geometric restriction symbols are shown. The default value is ON.

turnControl A Boolean specifying whether turn control geometric restriction symbols are shown. The default value is ON.

Return value

`None.`

Exceptions

RangeError.

Members

The GeometricRestrictionDisplayOptions object has members with the same names and descriptions as the arguments to the *`setValues`* method.

GraphicsInfo object

The GraphicsInfo object stores information about the graphics adapter installed in your system. The GraphicsInfo object has no constructor or methods; Abaqus creates the *GraphicsInfo* member when a session is started.

If you execute Abaqus/CAE on a remote system and display the main window locally, the *glx server* is your local machine and the *glx client* is the remote machine. This definition of client and server follows the X11 naming convention. If you execute and display Abaqus/CAE on the same machine, you will typically see identical values for both the name of the server and the name of the client.

The members are all read-only.

Access

```
session.graphicsInfo
```

Members

The GraphicsInfo object has the following members:

glVersion
A sequence of the type (Int, Int, String) specifying the three components of the OpenGL version. The sequence consists of an Int with the OpenGL major version number, an Int with the OpenGL minor version number, and a String with any additional information.

glxServerVersion
A sequence of the type (Int, Int, String) specifying the three components of the glx version of the server. The sequence consists of an Int with the glx major version number, an Int with the glx minor version number, and a String with any additional information.

glxClientVersion
A sequence of the type (Int, Int, String) specifying the three components of the of glx version of the client. The sequence consists of an Int with the glx major version number, an Int with the glx minor version number, and String with any additional information.

glVendor
A String specifying the graphics adapter vendor. On hardware accelerated systems *glVendor* specifies the vendor that manufactured the adapter. On systems without hardware acceleration *glVendor* specifies the developer of the software graphics library.

glRenderer
A String specifying the name of the rendering device or the name of the software graphics library.

glxServerVendor
A String specifying the glx developer on the server side.

glxClientVendor
A String specifying the glx developer on the client side.

GraphicsOptions object

The GraphicsOptions object stores settings that control how objects are rendered in all viewports. GraphicsOptions objects are accessed in one of two ways:

- The default graphics options. These settings are used as defaults when you start a session and by the **Defaults** button on the **Graphics Options** dialog box.
- The current graphics options.

The GraphicsOptions object has no constructor; Abaqus creates both the *defaultGraphicsOptions* and the *graphicsOptions* members when a session is started.

When you start a session, Abaqus detects the graphics hardware installed on your system and uses the `setValues` method in the environment file (`abaqus_v6.env`) to modify the members of the GraphicsOptions object. If your graphics hardware is not supported by Abaqus/CAE, or if you wish to override the default graphics options, you can modify settings in the environment file. For more information, see *Tuning graphics cards*.

Access

```
session.defaultGraphicsOptions
session.graphicsOptions
```

`setValues(...)`

This method modifies the GraphicsOptions object.

Required arguments

None.

Optional arguments

graphicsDriver

A SymbolicConstant specifying the graphics driver to use. Abaqus/CAE currently uses OpenGL exclusively so the only possible value is OPEN_GL. OPEN_GL takes advantage of graphics adapter hardware acceleration.

doubleBuffering

A Boolean specifying whether double buffering is used. The default value is ON.

Double buffering controls where Abaqus/CAE draws its graphics. When *doubleBuffering*=OFF, everything is drawn directly to the screen and on many systems you can see the progress of the drawing operations. Most users find this distracting, especially in dynamic situations such as view manipulation or animation of results. When *doubleBuffering*=ON, the drawing occurs in a separate graphics buffer that is displayed when all the drawing operations are complete. This results in a much smoother display during view changes or animation. It is recommended that you set double buffering to ON.

displayLists

A Boolean specifying whether a display list will be used to accelerate graphics performance. The default value is ON.

When *displayLists*=ON, drawing operations are recorded in a list that can be quickly replayed. This results in faster drawing on most systems but requires extra memory to record the drawing operations. In the Visualization module, display lists are only

used during view manipulations and then their use is subject to the setting of *viewManipDisplayListThreshold*.

highlightMethodHint

A sequence of SymbolicConstants specifying a hint used to modify the highlight method. Possible values are:

- HARDWARE_OVERLAY, specifying a hint of hardware overlay. The best graphics performance is achieved using hardware overlay, but not all systems and graphics adapters support hardware overlay.
- XOR, specifying a hint of XOR technique. The XOR technique uses a boolean pixel operation to simulate the drawing operations but can produce different colors depending on the color of the underlying pixels.
- SOFTWARE_OVERLAY, specifying a hint of software overlay. The software overlay method simulates the effect of hardware overlay.
- BLEND, specifying a hint of blend method. The blend method combines the color of the underlying pixel with the desired color producing an approximation of the transient graphics.

The default value is (HARDWARE_OVERLAY, XOR, SOFTWARE_OVERLAY, BLEND).

The values of this sequence are applied by Abaqus when you start a session in first to last order. The first successful value becomes the default highlight method. Not all graphics adapters support the HARDWARE_OVERLAY value and you must use the *highlightMethodHint* argument to provide an alternative.

You can use a single value to set the first element of the list, or you can use a tuple with one to four unique values. Abaqus sets any remaining elements of the tuple to unique values based on the default order.

dragMode

A SymbolicConstant specifying which rendering is used during dynamic rotations of the view. Possible values are:

- FAST, specifying a rendering mode where the image is rendered in wireframe.
- AS_IS, specifying a rendering mode where the image is rendered as is.

The default value is AS_IS.

When set to *dragMode*=FAST, a wireframe outline is drawn during view changes by rotation, pan, or zoom. When *dragMode*=AS_IS, everything displayed in the window will be drawn during view changes; however, the display may lag behind the mouse movement when the model is complex especially if you are using an older or slower system. For newer systems with graphics hardware acceleration the AS_IS setting can be accommodated without significant loss of performance.

antiAlias

A Boolean specifying whether lines will be smoothed to reduce the jagged effect of rasterization. The default value is ON.

autoFitAfterRotate

A Boolean specifying whether the model is automatically resized to fit the viewport after each view rotation. The default value is OFF.

polygonOffsetConstant

A Float specifying the offset added when drawing the faces of a polygon. The *polygonOffsetConstant* argument affects the behavior of only the OpenGL driver.

Possible values are $0.0 \leq$ *polygonOffsetConstant* ≤ 100.0. The default value is platform dependent and is typically between 0.0 and 2.0.

polygonOffsetSlope

A Float specifying the factor that multiplies the slope of each line before the line is added to the vertexes of a polygon face. The *polygonOffsetSlope* argument affects the behavior of only the OpenGL driver. Possible values are $0.0 \leq$ *polygonOffsetSlope* ≤ 100.0. The default value is platform dependent and is typically between 0.0 and 2.0.

printPolygonOffsetConstant

A Float specifying the offset added when drawing the faces of a polygon. *printPolygonOffsetConstant* is similar to *polygonOffsetConstant*; however, *printPolygonOffsetConstant* is used when printing and *polygonOffsetConstant* is used for display. Some systems, especially Windows, use different OpenGL drivers for printing and display, and you may have to use different offset values for each driver.

printPolygonOffsetSlope

A Float specifying the factor that multiplies the slope of each line before the line is added to the vertexes of a polygon face. *printPolygonOffsetSlope* is similar to *polygonOffsetSlope*; however, *printPolygonOffsetSlope* is used when printing and *polygonOffsetSlope* is used for display. Some systems, especially Windows, use different OpenGL drivers for printing and display, and you may have to use different offset values for each driver.

vertexArrays

A Boolean specifying how the three-dimensional vertices of the model are processed. When *vertexArrays*=OFF, each vertex of the model is processed separately. When *vertexArrays*=ON, the vertices are processed in large blocks resulting in faster display. Not all graphics adapters support this capability correctly. An indicator that the graphics adapters is not processing three-dimensional vertices correctly is the absence of graphics during “rubber banding” operations. For example, when dynamically dragging the radius of a circle in the Sketcher, the circle should be visible. The default value is ON.

vertexArraysInDisplayLists

A Boolean specifying whether the *vertexArrays* setting should temporarily be set to OFF when building a display list. The default value is ON.

Some graphics adapters do not properly support using vertex arrays inside a display list. Setting *vertexArraysInDisplayLists* to OFF has a smaller impact on graphics performance than setting *vertexArrays* or *displayLists* to OFF.

viewManipDisplayListThreshold

An Int specifying how large a display list may be created in order to accelerate view manipulation operations. Increasing this value when viewing large models will increase the delay before a view manipulation operation begins in order to obtain improved graphics performance during the view manipulation. If set high with a large model, the delay can be many seconds. In excessive cases, graphics memory can be exceeded and the result may be an empty display list (no visible model) for the view manipulation. This setting is treated as 0 if *displayLists*=OFF. Possible values are $0 \leq$ *viewManipDisplayListThreshold* ≤ 20000. The default value is 40.

directRendering

A Boolean specifying how Abaqus renders X11 graphics operations. When *directRendering*=OFF, the graphics are rendered through the X Server. When *directRendering*=ON, the graphics operations are sent directly to the graphics

adapter producing faster displays. For maximum performance, the initial value is ON. This argument is used only when you first start Abaqus/CAE; you cannot configure *directRendering* during a session.

hardwareAcceleration

A Boolean specifying whether a hardware accelerated OpenGL graphics driver will be used on Windows platforms. The default value is ON.

When *hardwareAcceleration*=OFF, the graphics driver uses a software implementation of OpenGL that is included with the operating system. This results in slower drawing on most systems; however, you may have to use the software implementation of OpenGL if the hardware graphics driver is incompatible with Abaqus/CAE.

hardwareAcceleration is used only when you first start Abaqus/CAE on a Windows platform; you cannot configure *hardwareAcceleration* during a session.*hardwareAcceleration* is not used when you start Abaqus/CAE on an X-Windows platform and display to a Windows platform running Exceed or any other X-Windows server.

hardwareOverlay

A Boolean specifying whether hardware overlay planes will be used if available. The default value is the same value as the *hardwareOverlayAvailable* member.

When *hardwareOverlayAvailable*=OFF, it will not be possible to set *hardwareOverlay* to ON and the HARDWARE_OVERLAY highlight method will not be available. If viewports display a solid color and will not display the model, it will be necessary to inhibit hardware overlay completely by setting the ABAQUS_EMULATE_OVERLAYS environment variable (to any value) before starting Abaqus/CAE.

hardwareOverlay is used only when you first start Abaqus/CAE; you cannot configure *hardwareOverlay* during a session.

textureMapping

A Boolean specifying whether textures will be used to display contour plots. The default value is ON.

Turning off texture mapping is necessary only if viewports will not correctly display a contour plot of your model.

printTextureMapping

A Boolean specifying whether textures will be used to display contour plots. The default value is ON.

Turning off texture mapping for printing is necessary only if printed output does not correctly display a contour plot of your model. *printTextureMapping* is similar to *textureMapping*; however, *printTextureMapping* is used when printing and *textureMapping* is used for display. Some systems, especially Windows, use different OpenGL drivers for printing and display, and you may have to use different settings for each driver.

backgroundStyle

A SymbolicConstant specifying the background style to be used for all viewport windows. Possible values are SOLID and GRADIENT. The default value is SOLID.

If *backgroundStyle*=SOLID, the viewport background will appear as a solid color as specified by *backgroundColor*. If *backgroundStyle*=GRADIENT, the viewport background will be drawn as a gradient beginning with the *backgroundColor* at the

top of the viewport and gradually blending to the *backgroundBottomColor* at the bottom of the viewport.

backgroundColor

A String specifying one of the two background colors for all viewport windows. The initial color is black. A list of valid color strings is in the *colors* map in the *Session* object.

backgroundBottomColor

A String specifying one of the two background colors for all viewport windows. This color is used only if *backgroundStyle* =GRADIENT. The initial color is black. A list of valid color strings is in the *colors* map in the *Session* object.

backgroundOverride

A Boolean specifying whether a viewport background style of GRADIENT can be overridden when displaying certain objects, such as sketches or XY plots. When overridden, the background will be the top color of the gradient background.

backfaceCulling

A Boolean specifying whether facets that are determined to be facing away from the viewer will be drawn. The default value is ON. backfaceCulling provides a performance enhancement when displaying solid elements where the front side of the element occludes the back side of the element. Set *backfaceCulling*=OFF if it appears that you are seeing the back side of an element and the front side is missing. You should also set *backfaceCulling*=OFF if you believe the display is not complete.

accelerateOffScreen

A Boolean specifying whether the hardware accelerated graphics driver will be used for off-screen rendering. The default value is ON if graphics hardware acceleration is available and has not been disabled via the hardwareAcceleration option, and the graphics driver supports the underlying technology. When set to OFF, an alternate (slower) technique will be used to create off-screen images. Off-screen rendering is used for Printing, Probe, and backing store (viewport refresh). Setting this value to OFF will force printed images to be rendered without hardware acceleration. This is useful when writing automated tests to produce raster images that you will want to compare across multiple machines that may have different graphics environments.

backingStore

A Boolean specifying whether a backing store will be used to refresh a viewport after a window occluding the viewport is moved or dismissed. The default value is ON.

shadersAvailable

A Boolean specifying if the graphics hardware supports the OpenGL Shading Language (GLSL).

translucencyMode

An Int specifying whether speed or accuracy is more important when drawing translucent objects. Lower values optimize for speed while higher values optimize for accuracy. The actual meaning of each setting will depend on the setting of *shadersAvailable* and the capabilities of the graphics hardware and driver. Possible values are $1 \leq$ *translucencyMode* ≤ 6. The default value is 4.

options

`None` or a GraphicsOptions object specifying the object from which values are to be copied. If other arguments are also supplied to `setValues`, they will override the values in the *options* member. The default value is `None`.

contourRangeTexturePrecision A Float specifying a tolerance used when computing the appropriate scale for transforming result (contour) values to texture values. When set too low the 'out of range' colors may be incorrectly shown for values near the range limits. The default value is 0.5×10^{-5}.

Return value

`None.`

Exceptions

RangeError.

Members

The GraphicsOptions object can have the following members:

backgroundOverride A Boolean specifying whether a viewport background style of GRADIENT can be overridden when displaying certain objects, such as sketches or XY plots. When overridden, the background will be the top color of the gradient background.

backfaceCulling A Boolean specifying whether facets that are determined to be facing away from the viewer will be drawn. The default value is ON. backfaceCulling provides a performance enhancement when displaying solid elements where the front side of the element occludes the back side of the element. Set *backfaceCulling*=OFF if it appears that you are seeing the back side of an element and the front side is missing. You should also set *backfaceCulling*=OFF if you believe the display is not complete.

graphicsDriver A SymbolicConstant specifying the graphics driver to use. Abaqus/CAE currently uses OpenGL exclusively so the only possible value is OPEN_GL. OPEN_GL takes advantage of graphics adapter hardware acceleration.

doubleBuffering A Boolean specifying whether double buffering is used. The default value is ON.

Double buffering controls where Abaqus/CAE draws its graphics. When *doubleBuffering*=OFF, everything is drawn directly to the screen and on many systems you can see the progress of the drawing operations. Most users find this distracting, especially in dynamic situations such as view manipulation or animation of results. When *doubleBuffering*=ON, the drawing occurs in a separate graphics buffer that is displayed when all the drawing operations are complete. This results in a much smoother display during view changes or animation. It is recommended that you set double buffering to ON.

displayLists A Boolean specifying whether a display list will be used to accelerate graphics performance. The default value is ON.

When *displayLists*=ON, drawing operations are recorded in a list that can be quickly replayed. This results in faster drawing on most systems but requires extra memory to record the drawing operations. In the Visualization module, display lists are only used during view manipulations and then their use is subject to the setting of *viewManipDisplayListThreshold*.

dragMode

A SymbolicConstant specifying which rendering is used during dynamic rotations of the view. Possible values are:

- FAST, specifying a rendering mode where the image is rendered in wireframe.
- AS_IS, specifying a rendering mode where the image is rendered as is.

The default value is AS_IS.

When set to *dragMode*=FAST, a wireframe outline is drawn during view changes by rotation, pan, or zoom. When *dragMode*=AS_IS, everything displayed in the window will be drawn during view changes; however, the display may lag behind the mouse movement when the model is complex especially if you are using an older or slower system. For newer systems with graphics hardware acceleration the AS_IS setting can be accommodated without significant loss of performance.

antiAlias

A Boolean specifying whether lines will be smoothed to reduce the jagged effect of rasterization. The default value is ON.

autoFitAfterRotate

A Boolean specifying whether the model is automatically resized to fit the viewport after each view rotation. The default value is OFF.

polygonOffsetConstant

A Float specifying the offset added when drawing the faces of a polygon. The *polygonOffsetConstant* argument affects the behavior of only the OpenGL driver. Possible values are $0.0 \leq$ *polygonOffsetConstant* ≤ 100.0. The default value is platform dependent and is typically between 0.0 and 2.0.

polygonOffsetSlope

A Float specifying the factor that multiplies the slope of each line before the line is added to the vertexes of a polygon face. The *polygonOffsetSlope* argument affects the behavior of only the OpenGL driver. Possible values are $0.0 \leq$ *polygonOffsetSlope* ≤ 100.0. The default value is platform dependent and is typically between 0.0 and 2.0.

printPolygonOffsetConstant

A Float specifying the offset added when drawing the faces of a polygon. *printPolygonOffsetConstant* is similar to *polygonOffsetConstant*; however, *printPolygonOffsetConstant* is used when printing and *polygonOffsetConstant* is used for display. Some systems, especially Windows, use different OpenGL drivers for printing and display, and you may have to use different offset values for each driver.

printPolygonOffsetSlope

A Float specifying the factor that multiplies the slope of each line before the line is added to the vertexes of a polygon face. *printPolygonOffsetSlope* is similar to *polygonOffsetSlope*; however, *printPolygonOffsetSlope* is used when printing and *polygonOffsetSlope* is used for display. Some systems, especially Windows, use different OpenGL drivers for printing and display, and you may have to use different offset values for each driver.

vertexArrays

A Boolean specifying how the three-dimensional vertices of the model are processed. When *vertexArrays*=OFF, each vertex of the model is processed separately. When *vertexArrays*=ON, the vertices are processed in large blocks resulting in faster display. Not all graphics adapters support this capability correctly. An indicator that the graphics adapters is not processing three-dimensional vertices correctly is

the absence of graphics during “rubber banding” operations. For example, when dynamically dragging the radius of a circle in the Sketcher, the circle should be visible. The default value is ON.

vertexArraysInDisplayLists

A Boolean specifying whether the *vertexArrays* setting should temporarily be set to OFF when building a display list. The default value is ON.

Some graphics adapters do not properly support using vertex arrays inside a display list. Setting *vertexArraysInDisplayLists* to OFF has a smaller impact on graphics performance than setting *vertexArrays* or *displayLists* to OFF.

viewManipDisplayListThreshold

An Int specifying how large a display list may be created in order to accelerate view manipulation operations. Increasing this value when viewing large models will increase the delay before a view manipulation operation begins in order to obtain improved graphics performance during the view manipulation. If set high with a large model, the delay can be many seconds. In excessive cases, graphics memory can be exceeded and the result may be an empty display list (no visible model) for the view manipulation. This setting is treated as 0 if *displayLists*=OFF. Possible values are $0 \leq$ *viewManipDisplayListThreshold* ≤ 20000. The default value is 40.

directRendering

A Boolean specifying how Abaqus renders X11 graphics operations. When *directRendering*=OFF, the graphics are rendered through the X Server. When *directRendering*=ON, the graphics operations are sent directly to the graphics adapter producing faster displays. For maximum performance, the initial value is ON. This argument is used only when you first start Abaqus/CAE; you cannot configure *directRendering* during a session.

hardwareAcceleration

A Boolean specifying whether a hardware accelerated OpenGL graphics driver will be used on Windows platforms. The default value is ON.

When *hardwareAcceleration*=OFF, the graphics driver uses a software implementation of OpenGL that is included with the operating system. This results in slower drawing on most systems; however, you may have to use the software implementation of OpenGL if the hardware graphics driver is incompatible with Abaqus/CAE.

hardwareAcceleration is used only when you first start Abaqus/CAE on a Windows platform; you cannot configure *hardwareAcceleration* during a session.*hardwareAcceleration* is not used when you start Abaqus/CAE on an X-Windows platform and display to a Windows platform running Exceed or any other X-Windows server.

hardwareOverlay

A Boolean specifying whether hardware overlay planes will be used if available. The default value is the same value as the *hardwareOverlayAvailable* member.

When *hardwareOverlayAvailable*=OFF, it will not be possible to set *hardwareOverlay* to ON and the HARDWARE_OVERLAY highlight method will not be available. If viewports display a solid color and will not display the model, it will be necessary to inhibit hardware overlay completely by setting the ABAQUS_EMULATE_OVERLAYS environment variable (to any value) before starting Abaqus/CAE.

hardwareOverlay is used only when you first start Abaqus/CAE; you cannot configure *hardwareOverlay* during a session.

textureMapping

A Boolean specifying whether textures will be used to display contour plots. The default value is ON.

Turning off texture mapping is necessary only if viewports will not correctly display a contour plot of your model.

printTextureMapping

A Boolean specifying whether textures will be used to display contour plots. The default value is ON.

Turning off texture mapping for printing is necessary only if printed output does not correctly display a contour plot of your model. *printTextureMapping* is similar to *textureMapping*; however, *printTextureMapping* is used when printing and *textureMapping* is used for display. Some systems, especially Windows, use different OpenGL drivers for printing and display, and you may have to use different settings for each driver.

backgroundStyle

A SymbolicConstant specifying the background style to be used for all viewport windows. Possible values are SOLID and GRADIENT. The default value is SOLID.

If *backgroundStyle*=SOLID, the viewport background will appear as a solid color as specified by *backgroundColor*. If *backgroundStyle*=GRADIENT, the viewport background will be drawn as a gradient beginning with the *backgroundColor* at the top of the viewport and gradually blending to the *backgroundBottomColor* at the bottom of the viewport.

accelerateOffScreen

A Boolean specifying whether the hardware accelerated graphics driver will be used for off-screen rendering. The default value is ON if graphics hardware acceleration is available and has not been disabled via the hardwareAcceleration option, and the graphics driver supports the underlying technology. When set to OFF, an alternate (slower) technique will be used to create off-screen images. Off-screen rendering is used for Printing, Probe, and backing store (viewport refresh). Setting this value to OFF will force printed images to be rendered without hardware acceleration. This is useful when writing automated tests to produce raster images that you will want to compare across multiple machines that may have different graphics environments.

backingStore

A Boolean specifying whether a backing store will be used to refresh a viewport after a window occluding the viewport is moved or dismissed. The default value is ON.

highlightMethod

A SymbolicConstant specifying the highlight method. For the GraphicsOptions object, possible values of the member are HARDWARE_OVERLAY, XOR, SOFTWARE_OVERLAY, and BLEND.

hardwareOverlayAvailable

A Boolean specifying if the graphics hardware supports hardware overlay.

shadersAvailable

A Boolean specifying if the graphics hardware supports the OpenGL Shading Language (GLSL).

translucencyMode

An Int specifying whether speed or accuracy is more important when drawing translucent objects. Lower values optimize for speed while higher values optimize for accuracy. The actual meaning of each setting will depend on the setting of

shadersAvailable and the capabilities of the graphics hardware and driver. Possible values are $1 \leq$ *translucencyMode* ≤ 6. The default value is 4.

contourRangeTexturePrecision

A Float specifying a tolerance used when computing the appropriate scale for transforming result (contour) values to texture values. When set too low the 'out of range' colors may be incorrectly shown for values near the range limits. The default value is 0.5×10^{-5}.

options

`None` or a GraphicsOptions object specifying the object from which values are to be copied. If other arguments are also supplied to `setValues`, they will override the values in the *options* member. The default value is `None`.

highlightMethodHint

A tuple of SymbolicConstants specifying a hint used to modify the highlight method. Possible values are:

- HARDWARE_OVERLAY, specifying a hint of hardware overlay. The best graphics performance is achieved using hardware overlay, but not all systems and graphics adapters support hardware overlay.
- XOR, specifying a hint of XOR technique. The XOR technique uses a boolean pixel operation to simulate the drawing operations but can produce different colors depending on the color of the underlying pixels.
- SOFTWARE_OVERLAY, specifying a hint of software overlay. The software overlay method simulates the effect of hardware overlay.
- BLEND, specifying a hint of blend method. The blend method combines the color of the underlying pixel with the desired color producing an approximation of the transient graphics.

The default value is (HARDWARE_OVERLAY, XOR, SOFTWARE_OVERLAY, BLEND).

The values of this sequence are applied by Abaqus when you start a session in first to last order. The first successful value becomes the default highlight method. Not all graphics adapters support the HARDWARE_OVERLAY value and you must use the *highlightMethodHint* argument to provide an alternative.

You can use a single value to set the first element of the list, or you can use a tuple with one to four unique values. Abaqus sets any remaining elements of the tuple to unique values based on the default order.

backgroundColor

A String specifying one of the two background colors for all viewport windows. The initial color is black. A list of valid color strings is in the *colors* map in the *Session* object.

backgroundBottomColor

A String specifying one of the two background colors for all viewport windows. This color is used only if *backgroundStyle* =GRADIENT. The initial color is black. A list of valid color strings is in the *colors* map in the *Session* object.

InteractionDisplayOptions object

The InteractionDisplayOptions object stores settings that specify how assemblies are to be displayed in a particular viewport when

```
session.viewports[name].assemblyDisplay.interactions=ON
```

The InteractionDisplayOptions object has no constructor. When you create a new viewport, the settings are copied from the current viewport.

Access

```
session.viewports[name].assemblyDisplay.interactionOptions
session.viewports[name].layers[name].assemblyDisplay\
.interactionOptions
```

`setValues(...)`

This method modifies the InteractionDisplayOptions object.

Required arguments

None.

Optional arguments

surfaceContact
A Boolean specifying whether surface contact symbols are shown. The default value is ON.

selfContact
A Boolean specifying whether self contact symbols are shown. The default value is ON.

elasticFoundation
A Boolean specifying whether elastic foundation symbols are shown. The default value is ON.

actuatorSensor
A Boolean specifying whether actuator/sensor symbols are shown. The default value is ON.

radiationAmbient
A Boolean specifying whether surface radiation-to-ambient symbols are shown. The default value is ON.

filmCondition
A Boolean specifying whether surface film condition symbols are shown. The default value is ON.

concentratedRadiationToAmbient
A Boolean specifying whether concentrated radiation-to-ambient symbols are shown. The default value is ON.

concentratedFilmCondition
A Boolean specifying whether concentrated film condition symbols are shown. The default value is ON.

Return value
`None.`

Exceptions
RangeError.

Members
The InteractionDisplayOptions object has members with the same names and descriptions as the arguments to the *`setValues`* method.

Light object

The Light object stores settings that control how objects are lit when the *renderStyle* is set to SHADED.

The Light object has no constructor; Abaqus creates them as part of the *defaultLightOptions* and the *lightOptions* objects when a session is started.

Access

```
session.defaultLightOptions.lights[i]
session.viewports[name].lightOptions.lights[i]
```

`setValues(...)`

This method modifies the Light object.

Required arguments

None.

Optional arguments

enabled
A Boolean specifying whether the light is on or off. The default value is OFF.

type
A SymbolicConstant specifying how the effect of the light should be calculated. Possible values are:

- DIRECTIONAL, specifying a constant vector should be used for the direction from the light to a vertex.
- POINT, specifying the vector from the light to each vertex should be calculated.

The default value is DIRECTIONAL.

When set to *type* =DIRECTIONAL, a constant vector is used for the direction from the light to a vertex. When *type* =POINT, the result is more realistic because the actual vector from the light to each vertex is calculated. However, overall performance is decreased.

latitude
A Float specifying the altitude of the light above or below the camera. Possible values are -90.0 $\leq$ *latitude* $\leq$ 90.0. The default value is 0.0.

longitude
A Float specifying the east/west position of the light to the left or right of the camera. Possible values are -90.0 $\leq$ *longitude* $\leq$ 90.0. The default value is 0.0.

diffuseColor
A String specifying the color of the light added to the scene by this light source. The initial value is 70% gray. A list of valid color strings is in the *colors* map in the *session* object.

specularColor
A String specifying the color of the specular highlights created by this light source. The initial value is 36% gray. A list of valid color strings is in the *colors* map in the *session* object.

Return value

None.

Exceptions

RangeError.

Members

The Light object has members with the same names and descriptions as the arguments to the *setValues* method.

LightOptions object

The LightOptions object stores settings that control how objects are lit when the *renderStyle* is set to SHADED. LightOptions objects are accessed in one of two ways:

- The default light options. These settings are used as defaults when you start a session and by the **Defaults** button on the **Light Options** dialog box.
- The light options associated with a particular viewport.

The LightOptions object has no constructor; Abaqus creates the *defaultLightOptions* member when a session is started. When a new viewport is created, the *lightOptions* member is copied from the current viewport.

Access

```
session.defaultLightOptions
session.viewports[name].lightOptions
```

`setValues(...)`

This method modifies the LightOptions object.

Required arguments

None.

Optional arguments

shading

A SymbolicConstant specifying the shading technique that should be used to fill facets for geometric bodies when *renderStyle* =SHADED. The lighting of facets for meshed geometry is not affected by this setting. Possible values are:

- GOURAUD, specifying that lighting values should be computed for each corner of a facet and interpolated to fill the remainder of the facet.
- PHONG, specifying that lighting values should be computed for each pixel of a facet.

The default value is GOURAUD.

When set to *shading* =GOURAUD, lighting values are computed for each corner of a facet and the lighting for the remainder of the facet is interpolated from the corner values. When *shading* =PHONG, lighting values are computed for each pixel of a facet.

Note:

The shading technique can only be set to PHONG when the *shadersAvailable* member of *GraphicsOptions* is True.

Printed output will only contain Phong shading if the output format is raster and the *accelerateOffScreen* member of *GraphicsOptions* is ON.

The *renderStyle* setting is part of *AssemblyDisplayOptions*, *PartDisplayOptions*, and various other options objects not listed here since they are generally used for meshed geometry.

viewpoint

A SymbolicConstant specifying how specular highlights should be calculated. Possible values are:

- INFINITE, specifying that a constant vector should be used for the direction from the camera to a vertex when computing specular highlights.
- LOCAL, specifying that the vector from the camera to each vertex should be calculated when computing specular highlights.

The default value is INFINITE.

When set to *viewpoint* =INFINITE, a constant vector is used for the direction from the camera (viewpoint) to a vertex. When *viewpoint* =LOCAL, the result is more realistic because the actual vector from the camera to each vertex is calculated. However, overall performance is decreased.

ambientColor

A String specifying the light applied evenly to the entire scene independent of any individual light. The initial value is 20% gray. A list of valid color strings is in the *colors* map in the *session* object.

materialShininess

A Float specifying the degree to which specular reflection is focused. The higher the *materialShininess* argument, the more focused the specular highlight. Possible values are $0.0 \leq$ *polygonOffsetConstant* ≤ 128.0. The default value is 105.0.

Return value

`None.`

Exceptions

RangeError.

Members

The LightOptions object has the following members:

shading

A SymbolicConstant specifying the shading technique that should be used to fill facets for geometric bodies when *renderStyle* =SHADED. The lighting of facets for meshed geometry is not affected by this setting. Possible values are:

- GOURAUD, specifying that lighting values should be computed for each corner of a facet and interpolated to fill the remainder of the facet.
- PHONG, specifying that lighting values should be computed for each pixel of a facet.

The default value is GOURAUD.

When set to *shading* =GOURAUD, lighting values are computed for each corner of a facet and the lighting for the remainder of the facet is interpolated from the corner values. When *shading* =PHONG, lighting values are computed for each pixel of a facet.

Note:

The shading technique can only be set to PHONG when the *shadersAvailable* member of *GraphicsOptions* is True.

Printed output will only contain Phong shading if the output format is raster and the *accelerateOffScreen* member of *GraphicsOptions* is ON.

The *renderStyle* setting is part of *AssemblyDisplayOptions*, *PartDisplayOptions*, and various other options objects not listed here since they are generally used for meshed geometry.

viewpoint

A SymbolicConstant specifying how specular highlights should be calculated. Possible values are:

- INFINITE, specifying that a constant vector should be used for the direction from the camera to a vertex when computing specular highlights.
- LOCAL, specifying that the vector from the camera to each vertex should be calculated when computing specular highlights.

The default value is INFINITE.

When set to *viewpoint* =INFINITE, a constant vector is used for the direction from the camera (viewpoint) to a vertex. When *viewpoint* =LOCAL, the result is more realistic because the actual vector from the camera to each vertex is calculated. However, overall performance is decreased.

materialShininess

A Float specifying the degree to which specular reflection is focused. The higher the *materialShininess* argument, the more focused the specular highlight. Possible values are $0.0 \le$ *polygonOffsetConstant* ≤ 128.0. The default value is 105.0.

lights

A *LightArray* object of length 8.

ambientColor

A String specifying the light applied evenly to the entire scene independent of any individual light. The initial value is 20% gray. A list of valid color strings is in the *colors* map in the *session* object.

LoadDisplayOptions object

The LoadDisplayOptions object stores settings that specify how assemblies are to be displayed in a particular viewport when

```
session.viewports[name].assemblyDisplay.loads=ON
```

The LoadDisplayOptions object has no constructor. When you create a new viewport, the settings are copied from the current viewport.

Access

```
session.viewports[name].assemblyDisplay.loadOptions
session.viewports[name].layers[name].assemblyDisplay.loadOptions
```

`setValues(...)`

This method modifies the LoadDisplayOptions object.

Required arguments

None.

Optional arguments

concentratedForce A Boolean specifying whether concentrated force symbols are shown. The default value is ON.

moment A Boolean specifying whether moment symbols are shown. The default value is ON.

pressure A Boolean specifying whether pressure symbols are shown. The default value is ON.

pipePressure A Boolean specifying whether pipe pressure symbols are shown. The default value is ON.

bodyForce A Boolean specifying whether body force symbols are shown. The default value is ON.

lineLoad A Boolean specifying whether line load symbols are shown. The default value is ON.

gravity A Boolean specifying whether gravity symbols are shown. The default value is ON.

boltLoad A Boolean specifying whether bolt load symbols are shown. The default value is ON.

pegLoad A Boolean specifying whether PEG load symbols are shown. The default value is ON.

connectorForce
A Boolean specifying whether connector force symbols are shown. The default value is ON.

connectorMoment
A Boolean specifying whether connector moment symbols are shown. The default value is ON.

inertiaRelief
A Boolean specifying whether inertia relief symbols are shown. The default value is ON.

rotationalIntertiaLoad
A Boolean specifying whether rotational inertia load symbols are shown. The default value is ON.

coriolisForce
A Boolean specifying whether coriolis force symbols are shown. The default value is ON.

bodyHeatFlux
A Boolean specifying whether body heat flux symbols are shown. The default value is ON.

surfaceHeatFlux
A Boolean specifying whether surface heat flux symbols are shown. The default value is ON.

concentratedHeatFlux
A Boolean specifying whether concentrated heat flux symbols are shown. The default value is ON.

concentratedPoreFluid
A Boolean specifying whether concentrated pore fluid symbols are shown. The default value is ON.

surfacePoreFluid
A Boolean specifying whether surface pore fluid symbols are shown. The default value is ON.

hydroFluidFlow
A Boolean specifying whether hydro fluid flow symbols are shown. The default value is ON.

concentratedCharge
A Boolean specifying whether concentrated charge symbols are shown. The default value is ON.

concentratedCurrent
A Boolean specifying whether concentrated current symbols are shown. The default value is ON.

surfaceCharge
A Boolean specifying whether surface charge symbols are shown. The default value is ON.

surfaceCurrent
A Boolean specifying whether surface current symbols are shown. The default value is ON.

bodyCharge
A Boolean specifying whether body charge symbols are shown. The default value is ON.

bodyCurrent	A Boolean specifying whether body current symbols are shown. The default value is ON.
inwardVolAccel	A Boolean specifying whether inward volume acceleration symbols are shown. The default value is ON.
bodyConcentrationFlux	A Boolean specifying whether body concentration flux symbols are shown. The default value is ON.
surfaceConcentrationFlux	A Boolean specifying whether surface concentration flux symbols are shown. The default value is ON.
concentratedConcentrationFlux	A Boolean specifying whether concentrated concentration flux symbols are shown. The default value is ON.

Return value

`None.`

Exceptions

RangeError.

Members

The LoadDisplayOptions object has members with the same names and descriptions as the arguments to the *setValues* method.

MeshDisplayOptions object

The MeshDisplayOptions object stores settings that specify how the assembly is displayed in a particular viewport when

```
session.viewports[name].assemblyDisplay.mesh=ON
```

The MeshDisplayOptions object has no constructor. When you create a new viewport, the settings are copied from the current viewport.

Access

```
session.viewports[name].assemblyDisplay.meshOptions
session.viewports[name].layers[name].assemblyDisplay.meshOptions
session.viewports[name].layers[name].partDisplay.meshOptions
session.viewports[name].partDisplay.meshOptions
```

`setValues(...)`

This method modifies the MeshDisplayOptions object.

Required arguments

None.

Optional arguments

nodeLabels

A Boolean specifying whether node labels are shown. The default value is OFF.

elementLabels

A Boolean specifying whether element labels are shown. The default value is OFF.

meshVisibleEdges

A SymbolicConstant specifying how the mesh's edges are drawn. Possible values are:

- ALL, specifying that all edges are shown.
- EXTERIOR, specifying that only exterior edges are shown.
- FEATURE, specifying that edges are shown based on *featureAngle*.
- FREE, specifying that only free edges are shown.
- NONE, specifying that no display edges are shown.

The default value is EXTERIOR.

featureAngle

A Float specifying the angle in degrees to be used in calculating a feature edge plot. Possible values are $0 \leq featureAngle \leq 90$. The default value is 20.0.

meshEdgesInShaded

A Boolean specifying whether mesh edges are displayed in shaded mode. The default value is ON.

meshTechnique

A Boolean specifying whether the regions of the assembly will be color coded based on the meshing technique assigned to the regions. This argument is ignored in partDisplay. The default value is OFF.

seeds

A Boolean specifying whether seeds are shown. This argument is ignored in partDisplay. The default value is OFF.

Return value

`None.`

Exceptions

RangeError.

Members

The MeshDisplayOptions object has members with the same names and descriptions as the arguments to the *`setValues`* method.

OptimizationTaskDisplayOptions object

The OptimizationTaskDisplayOptions object stores settings that specify how assemblies are to be displayed in a particular viewport when

```
session.viewports[name].assemblyDisplay.optimizationTasks=ON
```

The OptimizationTaskDisplayOptions object has no constructor. When you create a new viewport, the settings are copied from the current viewport.

Access

```
session.viewports[name].assemblyDisplay.optimizationTaskOptions
session.viewports[name].layers[name].assemblyDisplay\
.optimizationTaskOptions
```

`setValues(...)`

This method modifies the OptimizationTaskDisplayOptions object.

Required arguments

None.

Optional arguments

topologyTask A Boolean specifying whether topology task symbols are shown. The default value is ON.

shapeTask A Boolean specifying whether shape task symbols are shown. The default value is ON.

Return value

`None.`

Exceptions

RangeError.

Members

The OptimizationTaskDisplayOptions object has members with the same names and descriptions as the arguments to the *`setValues`* method.

PartDisplayOptions object

The PartDisplayOptions object stores settings that specify how parts are to be displayed in a particular viewport. The PartDisplayOptions object has no constructor. When you create a new viewport, the settings are copied from the current viewport.

Access

```
session.viewports[name].layers[name].partDisplay
import part
session.viewports[name].partDisplay
```

`setValues(...)`

This method modifies the PartDisplayOptions object.

Required arguments

None.

Optional arguments

renderStyle
A SymbolicConstant specifying how the image in the viewport is rendered. Possible values are WIREFRAME, HIDDEN, and SHADED. The default value is WIREFRAME.

visibleDisplayGroups
A sequence of *DisplayGroup* objects specifying the DisplayGroups visible in the viewport. Currently the sequence can contain a maximum of one *DisplayGroup* object. The default value is an empty sequence.

engineeringFeatures
A Boolean specifying whether engineering features are shown. The default value is OFF.

renderBeamProfiles
A Boolean specifying whether to render the beam profiles. The default value is OFF.

beamScaleFactor
A Float specifying the beam profile scale factor. The beamScaleFactor must be greater than zero. The default value is 1.0.

Return value

`None.`

Exceptions

RangeError.

Members

The PartDisplayOptions object can have the following members:

engineeringFeatures

A Boolean specifying whether engineering features are shown. The default value is OFF.

renderBeamProfiles

A Boolean specifying whether to render the beam profiles. The default value is OFF.

beamScaleFactor

A Float specifying the beam profile scale factor. The beamScaleFactor must be greater than zero. The default value is 1.0.

mesh

A Boolean specifying whether the mesh should be displayed.

renderStyle

A SymbolicConstant specifying how the image in the viewport is rendered. Possible values are WIREFRAME, HIDDEN, and SHADED. The default value is WIREFRAME.

displayGroup

A *DisplayGroup* object specifying the current display group and referring to an object in the *displayGroups* member of *Session*.

displayGroupInstances

A repository of *DisplayGroupInstance* objects.

engineeringFeatureOptions

An *EngineeringFeatureDisplayOptions* object.

geometryOptions

A *GeometryDisplayOptions* object.

meshOptions

A *MeshDisplayOptions* object.

StopConditionDisplayOptions object

The StopConditionDisplayOptions object stores settings that specify how assemblies are to be displayed in a particular viewport when

```
session.viewports[name].assemblyDisplay.stopConditions=ON
```

The StopConditionDisplayOptions object has no constructor. When you create a new viewport, the settings are copied from the current viewport.

Access

```
session.viewports[name].assemblyDisplay.stopConditionOptions
session.viewports[name].layers[name].assemblyDisplay\
.stopConditionOptions
```

setValues(...)

This method modifies the StopConditionDisplayOptions object.

Required arguments

None.

Optional arguments

localStopCondition A Boolean specifying whether local stop condition symbols are shown. The default value is ON.

Return value

`None.`

Exceptions

RangeError.

Members

The StopConditionDisplayOptions object has members with the same names and descriptions as the arguments to the *setValues* method.

SymbolDisplayOptions object

The SymbolDisplayOptions object stores settings that specify how the assembly is displayed in a particular viewport. The SymbolDisplayOptions object has no constructor. When you create a new viewport, the settings are copied from the current viewport.

Access

```
session.viewports[name].assemblyDisplay.symbolOptions
session.viewports[name].layers[name].assemblyDisplay.symbolOptions
```

setValues(...)

This method modifies the SymbolDisplayOptions object.

Required arguments

None.

Optional arguments

otherSymbolSize

An Int specifying the size of the scalar attribute symbols. Possible values are 1 ≤*scalarSymbolSize*≤ 30. The default value is 12.

arrowSymbolSize

An Int specifying the size of the vector and tensor attribute symbols. Possible values are 1 ≤*vectorSymbolSize*≤ 30. The default value is 12.

faceSymbolDensity

An Int specifying the relative density of the attribute symbols drawn on geometric faces. Possible values are 1 ≤*faceSymbolDensity*≤ 10. The default value is 5.

edgeSymbolDensity

An Int specifying the relative density of the attribute symbols drawn on geometric edges. Possible values are 1 ≤*edgeSymbolDensity*≤ 10. The default value is 5.

meshSymbolFraction

A Float specifying the fraction of the attribute symbols drawn on orphan mesh regions. Possible values are 0.0 ≤*meshSymbolFraction*≤ 1.0. The default value is 1.0.

showFields

A Boolean specifying whether symbols should be scaled based on analytical field value. The default value is ON.

Return value

None.

Exceptions

None.

Members

The SymbolDisplayOptions object has members with the same names and descriptions as the arguments to the *setValues* method.

ViewportAnnotationOptions object

The ViewportAnnotationOptions object stores settings that control how annotations are rendered in a particular viewport. ViewportAnnotationOptions objects are accessed in one of two ways:

- The default viewport annotations. These settings are used as defaults when other *viewportAnnotationOptions* members are created and can be set to customize user preferences.
- The viewport annotations associated with a particular viewport.

The ViewportAnnotationOptions object has no constructor; Abaqus creates the *defaultViewportAnnotationOptions* member when a session is started. When a new viewport is created, the settings are copied from the current viewport.

Access

```
session.defaultViewportAnnotationOptions
session.viewports[name].viewportAnnotationOptions
```

`setValues(...)`

This method modifies the ViewportAnnotationOptions object.

Required arguments

None.

Optional arguments

triad

A Boolean specifying whether the view orientation triad is shown. The default value is ON.

triadPosition

A pair of Ints specifying the position of the view orientation triad as a percentage of the viewport size. Possible values are $(0, 0) \leq$ *triadPosition* $\leq (100, 100)$. The default value is (6, 12).

triadColor

A String specifying the color of the view orientation triad. Possible values are any valid color. The default value is "White".

triadLabels

A SymbolicConstant specifying how the view orientation triad is labeled. Possible values are:

- NUMBERS, specifying the label axes 1, 2, 3.
- LETTERS, specifying the label axes X, Y, Z.

The default value is NUMBERS.

triadFont

A String specifying the font of the view orientation triad labels. Possible values are any valid font. The default value is "-*-verdana-bold-r-normal--120-*".

triadSize

An Int specifying the length of each triad axis as a percentage of the viewport size. Possible values are $1 \leq$ *legendDecimalPlaces* ≤ 50. The default value is 4.

legend
A Boolean specifying whether the legend is shown. The default value is ON.

legendMinMax
A Boolean specifying whether the minimum and maximum values for *X–Y* and contour plots are shown. The default value is OFF.

legendBox
A Boolean specifying whether the box around the legend is shown. The default value is ON.

legendDecimalPlaces
An Int specifying the number of decimal places to display in the legend. Possible values are $0 \leq$ *legendDecimalPlaces* ≤ 9. The default value is 3.

legendPosition
A pair of Ints specifying the position of the legend as a percentage of the viewport size. Possible values are (0, 0)$\leq$ *legendPosition* $\leq$ (100, 100). The default value is (2, 98).

legendFont
A String specifying the font of the legend labels. Possible values are any valid font. The default value is "-*-verdana-medium-r-*-*-*-120-*-*-*-*-iso8859-1".

legendTextColor
A String specifying the color of the legend. Possible values are any valid color. The default value is "White".

legendBackgroundStyle
A SymbolicConstant specifying the legend background style. Possible values are MATCH, TRANSPARENT, and OTHER. The default value is TRANSPARENT.

The default color when OTHER is specified is the background color (black).

legendBackgroundColor
A String specifying the color of the legend background. Possible values are any valid color. The initial value matches the viewport background.

title
A Boolean specifying whether the title block is shown. The default value is ON.

titleBox
A Boolean specifying whether the box around the title block is shown. The default value is OFF.

titlePosition
A pair of Ints specifying the position of the title block as a percentage of the viewport size. Possible values are (0, 0) $\leq$ *titlePosition* $\leq$ (100, 100). The default value is (13, 20).

titleFont
A String specifying the font of the title. Possible values are any valid font. The default value is "-*-verdana-medium-r-*-*-*-120-*-*-*-*-iso8859-1".

titleTextColor
A String specifying the color of the title. Possible values are any valid color. The default value is "White".

titleBackgroundStyle
A SymbolicConstant specifying the title block background style. Possible values are MATCH, TRANSPARENT, and OTHER. The default value is TRANSPARENT.

The default color when OTHER is specified is the background color (black).

titleBackgroundColor
A String specifying the color of the title block background. Possible values are any valid color. The initial value matches the viewport background.

state
A Boolean specifying whether the state block is shown. The default value is ON.

stateBox
A Boolean specifying whether the box around the state block is shown. The default value is OFF.

statePosition
A pair of Ints specifying the position of the state block as a percentage of the viewport size. Possible values are (0, 0) $\leq$ *statePosition* $\leq$ (100, 100). The default value is (13, 12).

stateFont
A String specifying the font of the state label. Possible values are any valid font. The default value is "-*-verdana-medium-r-*-*-*-120-*-*-*-*-iso8859-1".

stateTextColor
A String specifying the color of the state block label. Possible values are any valid color. The default value is "White".

stateBackgroundStyle
A SymbolicConstant specifying the state block background style. Possible values are MATCH, TRANSPARENT, and OTHER. The default value is TRANSPARENT.

The default color when OTHER is specified is the background color (black).

stateBackgroundColor
A String specifying the color of the state block background. Possible values are any valid color. The initial value matches the viewport background.

compass
A Boolean specifying whether the 3D Compass is shown. The default value is ON.

compassScale
A Float specifying the relative size of the 3D Compass in the viewport. Possible values are 0.5 $\leq$ *compassScale* $\leq$ 2.0. The default value is 0.8.

compassPrivilegedPlane
A SymbolicConstant specifying the plane that will be used for the base of the 3D Compass. Possible values are XYPLANE, XZPLANE, and YZPLANE. The default value is XZPLANE.

Return value
`None.`

Exceptions
RangeError.

Members
The ViewportAnnotationOptions object has members with the same names and descriptions as the arguments to the *setValues* method.

Edit mesh commands

Edit mesh commands are used to edit an orphan mesh part or part instance or an Abaqus native mesh.

In this section:

- *Assembly object*
- *Part object*
- *MeshEditOptions object*

Assembly object

The following commands operate on Assembly objects. For more information about the Assembly object, see *Assembly object*.

Access

```
import meshEdit
```

`collapseMeshEdge(...)`

This method collapses an edge of a quadrilateral or triangular element of a part instance.

Required arguments

edge A single *MeshEdge* object specifying the element edge to collapse.

collapseMethod A SymbolicConstant specifying the method used to collapse the edge. Possible values are FORWARD, REVERSE, and AVERAGE.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`combineElement(...)`

This method combines two triangular elements of a part instance.

Required arguments

elements A sequence of triangular *MeshElement* objects specifying the elements to combine.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

deleteElement(...)

This method deletes the given elements from a part instance. The elements must have been generated using the bottom-up meshing technique.

Required arguments

elements A sequence of *MeshElement* objects or a Set object containing elements.

Optional arguments

deleteUnreferencedNodes A Boolean specifying whether to delete all those associated nodes that become unreferenced after the given elements are deleted. The default value is OFF.

Return value

`None.`

Exceptions

None.

projectNode(...)

This method projects the given nodes of a part instance onto a mesh entity, geometric entity, or a datum object.

Required arguments

nodes A sequence of *MeshNode* objects to be projected.

projectionReference An object specifying the target for the node projection operation. The *projectionReference* can be any one of the following objects: *MeshNode*, *MeshEdge*, *MeshFace*, *Vertex*, *Edge*, *Face*, *DatumPoint*, *DatumAxis*, or *DatumPlane*.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

editNode(...)

This method changes the coordinates of the given nodes on a part instance.

Required arguments

nodes
A sequence of MeshNode objects or a Set object containing nodes.

Optional arguments

coordinate1
A Float specifying the value of the first coordinate. If *coordinate1* and *offset1* are unspecified, the existing value does not change.

coordinate2
A Float specifying the value of the second coordinate. If *coordinate2* and *offset2* are unspecified, the existing value does not change.

coordinate3
A Float specifying the value of the third coordinate. If *coordinate3* and *offset3* are unspecified, the existing value does not change.

coordinates
A sequence of three-dimensional coordinate tuples specifying the coordinates for each of the given nodes. When specified, the number of coordinate tuples must match the number of given nodes, and be ordered to correspond to the given nodes in *ascending order* according to index. Furthermore, *coordinate1*, *coordinate2*, *coordinate3*, *offset1*, *offset2*, or *offset3* may not be specified.

offset1
A Float specifying an offset to apply to the value of the first coordinate of the specified nodes.

offset2
A Float specifying an offset to apply to the value of the second coordinate of the specified nodes.

offset3
A Float specifying an offset to apply to the value of the third coordinate of the specified nodes.

localCsys
A DatumCsys object specifying the local coordinate system. If unspecified, the global coordinate system will be used.

projectToGeometry
A Boolean specifying whether to project nodes back to their original geometry. For example, if a node is on a face, this method first positions the node at the new location and then projects it back to the original face. The default value is ON.

Return value

`None.`

Exceptions

A coordinate and an offset may not both be specified for the same coordinate component.

`mergeNodes(...)`

Merge the nodes of a part instance. The nodes must have been generated using the bottom-up meshing technique.

Required arguments

nodes A sequence of *MeshNode* objects specifying the nodes to merge.

Optional arguments

tolerance A Float specifying the maximum distance between nodes that will be merged to a single node. The location of the new node is the average position of the merged nodes. The default value is 10^{-6}.

removeDuplicateElements A Boolean specifying whether elements with the same connectivity after the merge will merged into a single element. The default value is True.

Return value

`None.`

Exceptions

None.

`mergeNodes(...)`

Merge two nodes of a part instance. At least one of the two nodes must have been generated using the bottom-up meshing technique.

Required arguments

node1 A *MeshNode* object specifying the first node to merge.

node2 A *MeshNode* object specifying the second node to merge.

Optional arguments

removeDuplicateElements A Boolean specifying whether elements with the same connectivity after the merge will merged into a single element. The default value is True.

Return value

`None.`

Exceptions

None.

`splitElement(...)`

This method splits quadrilateral elements into triangular elements.

Required arguments

elements A sequence of quadrilateral *MeshElement* objects specifying the elements to split. Each quadrilateral element is split into two triangular elements by the shorter diagonal.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

splitMeshEdge(...)

This method splits an edge of a quadrilateral or triangular element of a part instance.

Required arguments

edge A single *MeshEdge* object specifying the element edge to split.

Optional arguments

parameter A Float specifying the normalized distance along the *edge* at which to split. Possible values are 0.0 <*parameter*< 1.0. The default value is 0.5.

Return value

`None.`

Exceptions

None.

swapMeshEdge(...)

This method swaps the diagonal of two adjacent triangular elements of a part instance.

Required arguments

edge A single *MeshEdge* object specifying the element edge to swap.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`generateMeshByOffset(...)`

This method generates a solid or shell mesh from an orphan mesh surface by generating layers of elements that propagate out normal to the surface boundary.

Required arguments

region
A Region object specifying the domain to be offset.

meshType
A Symbolic Constant specifying the type of mesh to be generated. Possible values are SOLID or SHELL.

totalThickness
A Float specifying the total thickness of the solid layers. This argument applies only when *meshType*=SOLID.

distanceBetweenLayers
A Float specifying the distance between shell layers. This argument applies only when *meshType*=SHELL.

numLayers
An Int specifying the number of element layers to be generated.

Optional arguments

offsetDirection
A Symbolic Constant specifying the direction of the offset. This argument is required only when the given region relates to a shell mesh. Possible values are OUTWARD, INWARD, and BOTH. The default value is OUTWARD.

initialOffset
A Float specifying the magnitude of the initial offset. The default value is zero.

shareNodes
Boolean specifying whether the first layer of nodes should be shared with nodes on the base surface. The default value is False.

deleteBaseElements
A Boolean specifying whether to delete the shell elements after the offset layers are generated. The default value is False. This argument applies only when *meshType*=SHELL.

constantThicknessCorners
A Boolean specifying whether to use element-based thickness or nodal-based thickness. The default value is False.

extendElementSets
A Boolean specifying whether existing element sets that include base elements will be extended to include corresponding offset elements. The default value is False.

Return value

`None.`

Exceptions

None.

redoMeshEdit()

This method executes the edit mesh or the bottom-up meshing operation most recently undone by the `undoMeshEdit` method on an assembly. A redo action must be currently available for the assembly. This implies that the user must have executed the `undoMeshEdit` method on the assembly and that the user has not subsequently executed any further edit mesh commands on the assembly. It also implies that the user provided a sufficient cache allowance to store the undo operation.

Arguments

None.

Return value

`None.`

Exceptions

None.

undoMeshEdit()

This method undoes the most recent edit mesh or the bottom-up meshing operation on an assembly and restores the mesh on the affected part instance to its previous state. An edit mesh undo action must be available for the assembly. This implies that prior to executing an edit mesh command on the assembly, the user enabled edit mesh undo with a sufficient cache allowance to store the edit mesh operation.

Arguments

None.

Return value

`None.`

Exceptions

None.

Part object

The following commands operate on Part objects. For more information about the Part object, see *Part object*.

Access

```
import meshEdit
```

adjustMidsideNode(...)

This method is used to adjust the midside node of second-order elements of an orphan mesh part.

Required arguments

cornerNodes A sequence of Node objects specifying the nodes towards which connected midside nodes will be biased.

parameter A Float specifying the normalized distance along the edge of the midside nodes. Possible values are $0.0 \leq parameter \leq 1.0$, where 0.0 specifies the position of the corner node. The default value is 0.5.

Optional arguments

None.

Return value

None.

Exceptions

None.

cleanMesh(...)

This method is used to collapse short element edges and delete collapsed elements, or grow short element edges, on an orphan mesh part composed of linear elements.

Required arguments

mergeTolerance A Float specifying the edge length tolerance. During the operation, edges shorter than the given tolerance will be collapsed, or grown to the specified length.

Optional arguments

growEdges A Boolean specifying whether short element edges will be grown to the specified tolerance. Default is False, meaning short edges will be collapsed.

elements
The elements to consider as the domain for the operation. By default all elements on the part are considered. The elements may be given as a *MeshElementArray*, a list of *MeshElement* objects, a *Set*, or a list of *Set* objects.

refEdge
A *MeshEdge* specifying a reference edge to indicate a topological direction in a structured mesh that will limit which edges within the element domain are considered. That is, only edges that are found to be topologically parallel to the given reference edge will be considered by the operation. By default all edges of the element domain are considered, unless *thicknessDir* is specified, in which case the operation will attempt to determine the topological edges from the thickness direction.

thicknessDir
A tuple of two or three Floats indicating a vector along which element edge lengths will be measured.

moveLayers
A Boolean indicating whether element edges will be all grown in the direction of the thickness vector specified by *thicknessDir*. This argument is ignored unless *growEdges* is True and *thicknessDir* is provided. When this argument is True the growth of any given element edge will no longer be constrained by short edges on neighboring elements, but elements could move from their original positions in cases where there are multiple adjacent layers of thin elements. The default value is False.

Return value
`None.`

Exceptions
None.

`collapseMeshEdge(...)`

This method collapses an edge of a quadrilateral or triangular element of an orphan mesh part or part instance.

Required arguments
edge
A single *MeshEdge* object specifying the element edge to collapse.

collapseMethod
A SymbolicConstant specifying the method used to collapse the edge. Possible values are FORWARD, REVERSE, and AVERAGE.

Optional arguments
None.

Return value
`None.`

Exceptions
None.

combineElement(...)

This method combines two triangular elements of an orphan mesh part or an Abaqus native mesh.

Required arguments

elements A sequence of triangular *MeshElement* objects specifying the elements to combine.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

convertSolidMeshToShell()

This method removes all solid elements from an orphan mesh part and creates triangular or quadrilateral shell elements along their outer faces.

Arguments

None.

Return value

`None.`

Exceptions

None.

deleteElement(...)

This method deletes the given elements from an orphan mesh part or an Abaqus native mesh. If the elements belong to an Abaqus native mesh then the elements must have been generated using the bottom-up meshing technique.

Required arguments

elements A sequence of *MeshElement* objects or a Set object containing elements.

Optional arguments

deleteUnreferencedNodes A Boolean specifying whether to delete all those associated nodes that become unreferenced after the given elements are deleted. The default value is OFF.

Return value
`None.`

Exceptions
None.

deleteNode(...)

This method deletes the given nodes from an orphan mesh part.

Required arguments

nodes A sequence of MeshNode objects or a Set object containing nodes.

Optional arguments

deleteUnreferencedNodes A Boolean specifying whether to delete all those associated nodes that become unreferenced after the given nodes and the connected elements are deleted. The default value is OFF.

Return value
`None.`

Exceptions
None.

editNode(...)

This method changes the coordinates of the given nodes on an orphan mesh part or on an Abaqus native mesh.

Required arguments

nodes A sequence of MeshNode objects or a Set object containing nodes.

Optional arguments

coordinate1 A Float specifying the value of the first coordinate. If *coordinate1* and *offset1* are unspecified, the existing value does not change.

coordinate2 A Float specifying the value of the second coordinate. If *coordinate2* and *offset2* are unspecified, the existing value does not change.

coordinate3 A Float specifying the value of the third coordinate. If *coordinate3* and *offset3* are unspecified, the existing value does not change.

coordinates A sequence of three-dimensional coordinate tuples specifying the coordinates for each of the given nodes. When specified, the number of coordinate tuples must match the number

of given nodes, and be ordered to correspond to the given nodes in *ascending order* according to index. Furthermore, *coordinate1*, *coordinate2*, *coordinate3*, *offset1*, *offset2*, or *offset3* may not be specified.

offset1
A Float specifying an offset to apply to the value of the first coordinate of the specified nodes.

offset2
A Float specifying an offset to apply to the value of the second coordinate of the specified nodes.

offset3
A Float specifying an offset to apply to the value of the third coordinate of the specified nodes.

localCsys
A DatumCsys object specifying the local coordinate system. If unspecified, the global coordinate system will be used.

projectToGeometry
A Boolean specifying whether to project nodes back to their original geometry. For example, if a node is on a face, this method first positions the node at the new location and then projects it back to the original face. The default value is ON.

Return value
`None.`

Exceptions
A coordinate and an offset may not both be specified for the same coordinate component.

`projectNode(...)`

This method projects the given nodes onto a mesh entity, geometric entity, or a datum object. The nodes may belong to an orphan mesh part or to an Abaqus native mesh.

Required arguments

nodes
A sequence of *MeshNode* objects to be projected.

projectionReference
An object specifying the target for the node projection operation. The *projectionReference* can be any one of the following objects: *MeshNode*, *MeshEdge*, *MeshFace*, *Vertex*, *Edge*, *Face*, *DatumPoint*, *DatumAxis*, or *DatumPlane*.

Optional arguments
None.

Return value
`None.`

Exceptions
None.

generateMesh(...)

This method generates a new mesh on an orphan mesh part based on the original mesh.

Required arguments

None.

Optional arguments

elemShape A SymbolicConstant specifying the element shape to be used for meshing. Possible values are:

TRI

Refine a planar triangular mesh and replace it with a new one. If no element sizes are attached, the new mesh will be governed by the sizes of the boundary edges in the old mesh.

TET

Create a tetrahedral mesh from a closed shell of triangular elements.

Return value

`None.`

Exceptions

None.

generateMeshByOffset(...)

This method generates a solid or shell mesh from an orphan mesh surface by generating layers of elements that propagate out normal to the surface boundary.

Required arguments

region A Region object specifying the domain to be offset.

meshType A Symbolic Constant specifying the type of mesh to be generated. Possible values are SOLID or SHELL.

totalThickness A Float specifying the total thickness of the solid layers. This argument applies only when *meshType*=SOLID.

distanceBetweenLayers A Float specifying the distance between shell layers. This argument applies only when *meshType*=SHELL.

numLayers An Int specifying the number of element layers to be generated.

Optional arguments

offsetDirection A Symbolic Constant specifying the direction of the offset. This argument is required only when the given region relates to a shell mesh. Possible values are OUTWARD, INWARD, and BOTH. The default value is OUTWARD.

initialOffset A Float specifying the magnitude of the initial offset. The default value is zero.

shareNodes Boolean specifying whether the first layer of nodes should be shared with nodes on the base surface. The default value is False.

deleteBaseElements A Boolean specifying whether to delete the shell elements after the offset layers are generated. The default value is False. This argument applies only when *meshType*=SHELL.

constantThicknessCorners A Boolean specifying whether to use element-based thickness or nodal-based thickness. The default value is False.

extendElementSets A Boolean specifying whether existing element sets that include base elements will be extended to include corresponding offset elements. The default value is False.

Return value

`None.`

Exceptions

None.

`mergeNodes(...)`

Merge the nodes of an orphan mesh part, or nodes that were generated using the bottom-up meshing technique.

Required arguments

nodes A sequence of Node objects specifying the nodes to merge.

Optional arguments

tolerance A Float specifying the maximum distance between nodes that will be merged to a single node. The location of the new node is the average position of the merged nodes. The default value is 10^{-6}.

removeDuplicateElements A Boolean specifying whether elements with the same connectivity after the merge will merged into a single element. The default value is True.

keepHighLabels A Boolean specifying which node labels will remain after nodes are merged. If True then the highest node labels are kept; when False the lowest node labels are kept. The default value is False. This argument applies only to merging of orphan mesh nodes.

Return value
`None.`

Exceptions
None.

mergeElement(...)

Merge a selection of elements arranged in layers on an orphan mesh part into a single layer.

Required arguments

edge A *MeshEdge* of one of the specified elements that serves as a reference edge to indicate the topological direction for merging elements. All specified elements must be reachable by topological navigation from this element edge, and the topological direction must be unambiguous.

elements A *MeshElementArray*, a list of *MeshElement* objects, a *Set*, or a list of *Set* objects containing the elements to be included in the merge operation.

Optional arguments
None.

Return value
`None.`

Exceptions
None.

mergeNodes(...)

Merge two nodes of an orphan mesh part or an Abaqus native mesh. If the nodes belong to an Abaqus native mesh then at least one of the two nodes must have been generated using the bottom-up meshing technique.

Required arguments

node1 A *MeshNode* object specifying the first node to merge.

node2 A *MeshNode* object specifying the second node to merge.

Optional arguments

removeDuplicateElements A Boolean specifying whether elements with the same connectivity after the merge will merged into a single element. The default value is True.

keepHighLabels A Boolean specifying which node label will remain after nodes are merged. If True then the higher node label is kept; when False the lower node label is kept. The default value is False. This argument applies only to merging of orphan mesh nodes.

Return value
`None.`

Exceptions
None.

`orientElements(...)`

This method orients the stack direction of elements in a continuum shell or gasket mesh.

Required arguments

pickedElements	A sequence of *MeshElement* objects specifying the elements to orient.
referenceRegion	A *MeshFace* object specifying a reference top face that indicates the desired orientation.

Optional arguments
None.

Return value
`None.`

Exceptions
None.

`removeElementSize()`

This method removes the global element size from an orphan mesh part.

Arguments
None.

Return value
`None.`

Exceptions
None.

`renumberElement(...)`

This method assigns new labels to orphan mesh elements.

Required arguments
None.

Optional arguments

Either *startLabel* and *increment*, or *offset*, or *labels* must be specified.

elements
A *MeshElementArray* or a tuple or list of *MeshElement* objects, or a *Set* containing elements to be renumbered. If unspecified, all elements in the part will be renumbered.

startLabel
A positive Int specifying the new label for the first element in *elements*.

increment
A positive Int specifying the increment used for computation of new labels for all consecutive elements in *elements*.

offset
An Int by which existing labels of the specified elements will be offset.

labels
A list of labels for the specified elements. The length of this list must match the number of specified elements.

Return value

`None.`

Exceptions

Renumbering is attempted on a native part:
Error: Renumbering can be applied to orphan mesh parts only

Renumbering data is specified incorrectly:
Error: Either startLabel and increment or offset must be specified

Renumbering will result in invalid labels:
Error: Specified data will result in invalid labels

Renumbering will result in conflicting labels:
Error: Specified data will result in conflicting labels

`renumberNode(...)`

This method assigns new labels to orphan mesh nodes.

Required arguments

None.

Optional arguments

Either *startLabel* and *increment*, or *offset*, or *labels* must be specified.

nodes
A *MeshNodeArray* or a tuple or list of *MeshNode* objects, or a *Set* containing nodes to be renumbered. If unspecified, all nodes in the part will be renumbered.

startLabel
A positive Int specifying the new label for the first node in *nodes*.

increment
A positive Int specifying the increment used for computation of new labels for all consecutive nodes in *nodes*.

offset An Int by which existing labels of the specified nodes will be offset.

labels A list of labels for the specified nodes. The length of this list must match the number of specified nodes.

Return value
`None.`

Exceptions

Renumbering is attempted on a native part: Error: Renumbering can be applied to orphan mesh parts only

Renumbering data is specified incorrectly: Error: Either startLabel and increment or offset must be specified

Renumbering will result in invalid labels: Error: Specified data will result in invalid labels

Renumbering will result in conflicting labels: Error: Specified data will result in conflicting labels

`setElementSize(...)`

This method sets the global element size for an orphan mesh part.

Required arguments

size A Float specifying the desired element size.

Optional arguments

None.

Return value
`None.`

Exceptions

None.

`splitElement(...)`

This method splits quadrilateral elements of an orphan mesh part or a Abaqus native mesh into triangular elements.

Required arguments

elements A sequence of quadrilateral *MeshElement* objects specifying the elements to split. Each quadrilateral element is split into two triangular elements by the shorter diagonal.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`splitMeshEdge(...)`

This method splits an edge of a quadrilateral or triangular element of an orphan mesh part or an Abaqus native mesh.

Required arguments

edge A single *MeshEdge* object specifying the element edge to split.

Optional arguments

parameter A Float specifying the normalized distance along *edge* at which to split. Possible values are 0.0 <*parameter*< 1.0. The default value is 0.5.

Return value

`None.`

Exceptions

None.

`subdivideElement(...)`

Subdivide a selection of elements on an orphan mesh part in one or more directions.

Required arguments

None.

Optional arguments

elements A *MeshElementArray*, a list of *MeshElement* objects, a *Set*, or a list of *Set* objects containing the elements to be subdivided. By default all the elements of the part are subdivided.

divisionNumber An Int specifying the number of resulting elements for each input element in each direction of the subdivision. If *face* or *edge* are not specified, elements will be subdivided according to this number in all possible directions. Must be greater than one. Default is 2.

face A *MeshFace* object that serves as a reference for indicating two topological directions for the subdivision operation. Must be a face of one of the specified elements, and all specified elements

must be reachable by topological navigation from this element face. May not be combined with *edge*.

edge

A *MeshEdge* object that serves as a reference for indicating a single topological direction for the subdivision operation. Must be an edge of one of the specified elements, and all specified elements must be reachable by topological navigation from this element edge. May not be combined with *face*.

Return value

`None.`

Exceptions

None.

`swapMeshEdge(...)`

This method swaps the diagonal of two adjacent triangular elements of an orphan mesh part or an Abaqus native mesh.

Required arguments

edge

A single *MeshEdge* object specifying the element edge to swap.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`wrapMesh(...)`

This method wraps a planar orphan mesh part about the *Z*-axis.

Required arguments

radius

A Float specifying the radius of the cylinder about which the part is to be wrapped. The wrapping procedure will relocate a node at point (x, y) on the planar mesh to (x, θ, z), where r is the specified radius, $\theta = \frac{x}{r}$, and z=y.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

redoMeshEdit()

This method executes the edit mesh or the bottom-up meshing operation most recently undone by the `undoMeshEdit` method on an part. A redo action must be currently available for the part. This implies that the user must have executed the `undoMeshEdit` method on the part and that the user has not subsequently executed any further edit mesh commands on the assembly. It also implies that the user provided a sufficient cache allowance to store the undo operation.

Arguments

None.

Return value

`None.`

Exceptions

None.

undoMeshEdit()

This method undoes the most recent edit mesh or the bottom-up meshing operation on a part and restores the mesh to its previous state. An edit mesh undo action must be available for the part. This implies that prior to executing an edit mesh command on the part, the user enabled edit mesh undo with a sufficient cache allowance to store the edit mesh operation.

Arguments

None.

Return value

`None.`

Exceptions

None.

MeshEditOptions object

The MeshEditOptions object stores settings that specify the behavior when editing meshes on parts or part instances.

The MeshEditOptions object has no constructor. Abaqus creates the *MeshEditOptions* member when a session is started.

Access

```
mdb.meshEditOptions
```

setValues(...)

This method modifies the MeshEditOptions object.

Required arguments

None.

Optional arguments

maxUndoCacheElements A Float specifying the maximum allowable mesh edit undo cache size in millions of elements. If this value is set to at least the number of elements on a given part or part instance, at least one level of undo/redo capability is assured for subsequent mesh edit operations on that part or part instance. The default value is 0.0.

enableUndo A Boolean specifying whether undo/redo of mesh edit operations will be enabled. If *enableUndo* =OFF any existing cache for undo/redo operations will be cleared for all parts and assemblies in all models. The default value is OFF.

_suspendUndo A Boolean specifying the suspension of undo/redo for mesh edit operations. When undo/redo is suspended, undo/redo will not be available after subsequent mesh edit operations on a given part or part instances. Any pre-existing cache for mesh edit operations on other parts or assemblies in any model will be unaffected. The default value is OFF.

If you change the value of *enableUndo* to True, Abaqus sets *_suspendUndo* to False.

Return value

```
None.
```

Exceptions

None.

Members

The MeshEditOptions object has members with the same names and descriptions as the arguments to the `setValues` method.

Engineering Feature commands

A specific type of engineering feature object is designed for each type of engineering feature.

In this section:

- *EngineeringFeature object*
- *AssembledFastener object*
- *ContourIntegral object*
- *Crack object*
- *DebondVCCT object*
- *DiscreteFastener object*
- *Fastener object*
- *HeatCapacitance object*
- *Inertia object*
- *NonstructuralMass object*
- *PointFastener object*
- *PointMassInertia object*
- *SpringDashpot object*
- *SpringDashpotToGround object*
- *TwoPointSpringDashpot object*
- *XFEMCrack object*
- *Imperfection object*
- *FileImperfection object*
- *InputImperfection object*
- *DataImperfection object*

EngineeringFeature object

The EngineeringFeature object is a container for various specific engineering feature repositories.
The EngineeringFeature object has no explicit constructor or methods.

Access

```
import part
mdb.models[name].parts[name].engineeringFeatures
import assembly
mdb.models[name].rootAssembly.engineeringFeatures
```

assignSeam(...)

This method creates a seam crack along an edge or a face.

Required arguments

regions A sequence of *Region* objects specifying the domain of the seam crack. The *Region* objects must be faces or edges.

Optional arguments

None.

Return value

None.

Exceptions

None.

deleteSeam(...)

This method deletes a seam crack.

Required arguments

regions A sequence of *Region* objects specifying the domain of the seam crack. The *Region* objects must be faces or edges.

Optional arguments

None.

Return value

None.

Exceptions

None.

Members

The EngineeringFeature object can have the following members:

inertias A repository of *Inertia* objects.

cracks A repository of *Crack* objects.

fasteners A repository of *Fastener* objects.

springDashpots A repository of *SpringDashpot* objects.

imperfections A repository of *Imperfection* objects.

AssembledFastener object

The AssembledFastener object defines an assembled fastener.

The AssembledFastener object is derived from the *Fastener* object.

Access

```
import part
mdb.models[name].parts[name].engineeringFeatures.fasteners[name]
import assembly
mdb.models[name].rootAssembly.engineeringFeatures.fasteners[name]
```

AssembledFastener(...)

This method creates an AssembledFastener object. Although the constructor is available both for parts and for the assembly, AssembledFastener objects are currently supported only under the assembly.

Path

```
mdb.models[name].parts[name].engineeringFeatures.AssembledFastener
mdb.models[name].rootAssembly.engineeringFeatures.AssembledFastener
```

Required arguments

name
A String specifying the repository key.

region
A *Region* object specifying the region of attachment points to which assembled fasteners are applied.

templateModel
A String specifying the name of the template model.

controlSet
A *Region* object specifying the template model control point set. The set must contain a single node or vertex.

templateSurfaces
A sequence of Strings specifying the names of the template model surfaces that are referenced by tie or coupling constraints.

assignedSurfaces
A sequence of Strings specifying the names of the main model surfaces that will be substituted for the template model constraint surfaces.

propertyPrefix
A String specifying the name of the property prefix string. This string will be prepended to every property name as it is copied to the main model from the template model.

Optional arguments

orientMethod
A SymbolicConstant specifying the method used to orient the virtual instances of the template model at each attachment point. Possible values are NORMALS and CSYS. The default value is NORMALS.

localCsys

`None` or a *DatumCsys* object specifying the local coordinate system. If *localCsys*=`None`, the global coordinate system is used. When this member is queried, it returns an Int. The default value is `None`.

This argument applies only when *orientMethod*=CSYS.

scriptName

A String specifying the name of the property generation script. The default value is an empty string.

Return value

An AssembledFastener object.

Exceptions

None.

`setValues(...)`

This method modifies the AssembledFastener object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *AssembledFastener* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The AssembledFastener object has members with the same names and descriptions as the arguments to the *AssembledFastener* method.

In addition, the AssembledFastener object has the following member:

suppressed

A Boolean specifying whether the fastener is suppressed or not. The default value is OFF.

ContourIntegral object

The ContourIntegral object defines contour integral objects on an region. Currently only assembly regions are supported.

The ContourIntegral object is derived from the *Crack* object.

Access

```
import part
mdb.models[name].parts[name].engineeringFeatures.cracks[name]
import assembly
mdb.models[name].rootAssembly.engineeringFeatures.cracks[name]
```

ContourIntegral(...)

This method creates a ContourIntegral object. Although the constructor is available both for parts and for the assembly, ContourIntegral objects are currently supported only under the assembly.

Path

```
mdb.models[name].parts[name].engineeringFeatures.ContourIntegral
mdb.models[name].rootAssembly.engineeringFeatures.ContourIntegral
```

Required arguments

name
A String specifying the repository key.

crackFront
A *RegionArray* object specifying the crack-front region to which the contour integral is applied. If the crack-front consists of a single region, a *Region* object may be specified instead of a sequence with a single item in it.

crackTip
A *RegionArray* object specifying the crack-tip region to which the contour integral is applied. If the crack-tip consists of a single region, a *Region* object may be specified instead of a sequence with a single item in it.

extensionDirectionMethod
A SymbolicConstant specifying how the virtual crack extension direction vectors are defined. Possible values are CRACK_NORMAL and Q_VECTORS.

Optional arguments

symmetric
A Boolean specifying whether the crack is defined on a half model (about a symmetry plane) or whether it is defined on the whole model. The default value is OFF.

listOfRegions
A Boolean specifying whether the regions specified by *crackFront* and *crackTip* are specified using a single region or tuples of region objects. The default value is OFF.

crackFrontName
A String specifying the name of the crack-front region generated from the tuple of regions specifying the crack-front region. This argument is valid only when *listOfRegions* is ON. The default value is *name*+"Front."

crackTipName A String specifying the name of the crack-tip region generated from the tuple of regions specifying the crack-tip region. This parameter is valid only when *listOfRegions*=ON. The default value is *name*+"Tip."

crackNormal A sequence of sequences of Floats specifying the two points of the vector that describes the crack normal direction. Each point is defined by a tuple of two or three coordinates indicating its position. This argument is required only when *extensionDirectionMethod*=CRACK_NORMAL. The default value is an empty sequence.

qVectors A sequence of sequences of sequences of Floats specifying the vectors that indicate the set of crack extension directions. Each vector is described by a tuple of two points, and each point is described by a tuple of two or three coordinates indicating its position. This argument is required only when *extensionDirectionMethod*=Q_VECTORS. The default value is an empty sequence.

midNodePosition A Float specifying the position of the midside node along the edges of the second-order elements that radiate from the crack tip. Possible values are 0.0 <*midNodeParameter*< 1.0. The default value is 0.5.

collapsedElementAtTip A SymbolicConstant specifying the crack-tip singularity. Possible values are NONE, SINGLE_NODE, and DUPLICATE_NODES. The default value is NONE.

Return value

A ContourIntegral object.

Exceptions

None.

`setValues(...)`

This method modifies the ContourIntegral object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ContourIntegral* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The ContourIntegral object has members with the same names and descriptions as the arguments to the *ContourIntegral* method.

In addition, the ContourIntegral object has the following member:

suppressed A Boolean specifying whether the crack is suppressed or not. The default value is OFF.

Corresponding analysis keywords

- **CONTOUR INTEGRAL*

Crack object

The Crack object is the abstract base type for *ContourIntegral* and future crack objects.

Access

```
import part
mdb.models[name].parts[name].engineeringFeatures.cracks[name]
import assembly
mdb.models[name].rootAssembly.engineeringFeatures.cracks[name]
```

`resume()`

This method resumes the crack that was previously suppressed.

Arguments

None.

Return value

`None.`

Exceptions

None.

`suppress()`

This method suppresses the crack.

Arguments

None.

Return value

`None.`

Exceptions

None.

Members

The Crack object has the following members:

name	A String specifying the repository key.
suppressed	A Boolean specifying whether the crack is suppressed or not. The default value is OFF.

DebondVCCT object

The DebondVCCT object defines the parameters needed to activate crack propagation using VCCT.

The DebondVCCT object is derived from the *Crack* object.

Access

```
import part
mdb.models[name].parts[name].engineeringFeatures.cracks[name]
import assembly
mdb.models[name].rootAssembly.engineeringFeatures.cracks[name]
```

DebondVCCT(...)

This method creates a DebondVCCT object. Although the constructor is available both for parts and for the assembly, DebondVCCT objects are currently supported only under the assembly.

Path

```
mdb.models[name].parts[name].engineeringFeatures.DebondVCCT
mdb.models[name].rootAssembly.engineeringFeatures.DebondVCCT
```

Required arguments

name
A String specifying the repository key.

initiationStep
A String specifying the name of the step in which the DebondVCCT object is created.

surfToSurfInteraction
A String specifying the name of the *SurfaceToSurfaceContactStd* object that defines the surface to surface interaction for the crack surfaces.

Optional arguments

debondingForceAmplitude
A SymbolicConstant specifying whether the debond force between the two surfaces at the crack tip is to be released immediately or gradually during the following increment after debonding. Possible values are STEP and RAMP. The default value is STEP.

printToDATFrequency
An Int specifying the frequency at which output will be printed to DAT file. The default value is 1.

Return value

A DebondVCCT object.

Exceptions

None.

`setValues(...)`

This method modifies the DebondVCCT object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *DebondVCCT* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The DebondVCCT object has members with the same names and descriptions as the arguments to the *DebondVCCT* method.

In addition, the DebondVCCT object has the following member:

suppressed A Boolean specifying whether the crack is suppressed or not. The default value is OFF.

Corresponding analysis keywords

- **DEBOND*

DiscreteFastener object

The DiscreteFastener object defines a discrete fastener.

The DiscreteFastener object is derived from the *Fastener* object.

Access

```
import part
mdb.models[name].parts[name].engineeringFeatures.fasteners[name]
import assembly
mdb.models[name].rootAssembly.engineeringFeatures.fasteners[name]
```

DiscreteFastener(...)

This method creates a DiscreteFastener object. Although the constructor is available both for parts and for the assembly, DiscreteFastener objects are currently supported only under the assembly.

Path

```
mdb.models[name].parts[name].engineeringFeatures.DiscreteFastener
mdb.models[name].rootAssembly.engineeringFeatures.DiscreteFastener
```

Required arguments

name A String specifying the repository key.

region A *Region* object specifying the region to which the fastener is applied.

influenceRadius The SymbolicConstant WHOLE_SURFACE or a Float specifying the coupling influence radius.

Optional arguments

ur1 A Boolean specifying whether to constrain rotational displacement component about the 1-direction. The default value is ON.

ur2 A Boolean specifying whether to constrain rotational displacement component about the 2-direction. The default value is ON.

ur3 A Boolean specifying whether to constrain rotational displacement component about the 3-direction. The default value is ON.

coupling A SymbolicConstant specifying the coupling method used to couple the displacement and rotation of each attachment point to the average motion of the surface nodes within the radius of influence from the fastening point. Possible values are CONTINUUM and STRUCTURAL. The default value is CONTINUUM.

rotatonalCoupling A SymbolicConstant specifying the rotational coupling method used. Possible values are ROTATIONAL_CONTINUUM and ROTATIONAL_STRUCTURAL. The default value is ROTATIONAL_STRUCTURAL.

weightingMethod A SymbolicConstant specifying the weighting scheme to be used to weight the contribution of the displacements of the surface nodes within the radius of influence to the motion of the fastening point. UNIFORM, LINEAR, QUADRATIC, and CUBIC indicate uniform, linear decreasing, quadratic polynomial decreasing, and cubic polynomial monotonic decreasing weight distributions. Possible values are UNIFORM, LINEAR, QUADRATIC, and CUBIC. The default value is UNIFORM.

localCsys `None` or a *DatumCsys* object specifying the local coordinate system of fastener couplings. If *localCsys*=`None`, couplings are defined in the global coordinate system. When this member is queried, it returns an Int. The default value is `None`.

Return value

A DiscreteFastener object.

Exceptions

None.

`setValues(...)`

This method modifies the DiscreteFastener object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *DiscreteFastener* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The DiscreteFastener object has members with the same names and descriptions as the arguments to the *DiscreteFastener* method.

In addition, the DiscreteFastener object has the following member:

suppressed A Boolean specifying whether the fastener is suppressed or not. The default value is OFF.

Corresponding analysis keywords

- **COUPLING*, **DISTRIBUTING*

Fastener object

The Fastener object is the abstract base type for *PointFastener*, *DiscreteFastener*, and *AssembledFastener*.

Access

```
import part
mdb.models[name].parts[name].engineeringFeatures.fasteners[name]
import assembly
mdb.models[name].rootAssembly.engineeringFeatures.fasteners[name]
```

`resume()`

This method resumes the fastener that was previously suppressed.

Arguments

None.

Return value

`None.`

Exceptions

None.

`suppress()`

This method suppresses the fastener.

Arguments

None.

Return value

`None.`

Exceptions

None.

Members

The Fastener object has the following members:

name
A String specifying the repository key.

suppressed
A Boolean specifying whether the fastener is suppressed or not. The default value is OFF.

HeatCapacitance object

The HeatCapacitance object defines point heat capacitance on a part or an assembly region.

The HeatCapacitance object is derived from the *Inertia* object.

Access

```
import part
mdb.models[name].parts[name].engineeringFeatures.inertias[name]
import assembly
mdb.models[name].rootAssembly.engineeringFeatures.inertias[name]
```

HeatCapacitance(...)

This method creates a HeatCapacitance object.

Path

```
mdb.models[name].parts[name].engineeringFeatures.HeatCapacitance
mdb.models[name].rootAssembly.engineeringFeatures.HeatCapacitance
```

Required arguments

name
A String specifying the repository key.

region
A *Region* object specifying the region to which the heat capacitance is applied.

table
A sequence of sequences of Floats specifying heat capacitance properties. The items in the table data are described below.

Optional arguments

temperatureDependency
A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of field variable dependencies. The default value is 0.

Table data

The table data specify the following:

- Heat capacitance magnitude, ρcV (density × specific heat × volume).
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A HeatCapacitance object.

Exceptions

None.

setValues(...)

This method modifies the HeatCapacitance object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *HeatCapacitance* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The HeatCapacitance object has members with the same names and descriptions as the arguments to the *HeatCapacitance* method.

In addition, the HeatCapacitance object has the following member:

suppressed A Boolean specifying whether the inertia is suppressed or not. The default value is OFF.

Corresponding analysis keywords

- **HEATCAP*

Inertia object

The Inertia object is the abstract base type for *HeatCapacitance*, *NonstructuralMass*, and *PointMassInertia*.

Access

```
import part
mdb.models[name].parts[name].engineeringFeatures.inertias[name]
import assembly
mdb.models[name].rootAssembly.engineeringFeatures.inertias[name]
```

`resume()`

This method resumes the inertia that was previously suppressed.

Arguments

None.

Return value

`None.`

Exceptions

None.

`suppress()`

This method suppresses the inertia.

Arguments

None.

Return value

`None.`

Exceptions

None.

Members

The Inertia object has the following members:

name
A String specifying the repository key.

suppressed
A Boolean specifying whether the inertia is suppressed or not. The default value is OFF.

NonstructuralMass object

The NonstructuralMass object defines the mass contribution from nonstructural features into the model.

The NonstructuralMass object is derived from the *Inertia* object.

Access

```
import part
mdb.models[name].parts[name].engineeringFeatures.inertias[name]
import assembly
mdb.models[name].rootAssembly.engineeringFeatures.inertias[name]
```

NonstructuralMass(...)

This method creates a NonstructuralMass object.

Path

```
mdb.models[name].parts[name].engineeringFeatures.NonstructuralMass
mdb.models[name].rootAssembly.engineeringFeatures.NonstructuralMass
```

Required arguments

name A String specifying the repository key.

region A *Region* object specifying the region to which the mass is applied.

units A SymbolicConstant specifying the units used to specify the nonstructural mass. Possible values are TOTAL_MASS, MASS_PER_VOLUME, MASS_PER_AREA, and MASS_PER_LENGTH.

magnitude A Float specifying the mass magnitude.

Optional arguments

distribution A SymbolicConstant specifying the distribution of the nonstructural mass. Possible values are MASS_PROPORTIONAL and VOLUME_PROPORTIONAL. The default value is MASS_PROPORTIONAL.

The *distribution* argument applies only when *units*=TOTAL_MASS.

Return value

A NonstructuralMass object.

Exceptions

None.

setValues(...)

This method modifies the NonstructuralMass object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *NonstructuralMass* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The NonstructuralMass object has members with the same names and descriptions as the arguments to the *NonstructuralMass* method.

In addition, the NonstructuralMass object has the following member:

suppressed A Boolean specifying whether the inertia is suppressed or not. The default value is OFF.

Corresponding analysis keywords

- **NONSTRUCTURAL MASS*

PointFastener object

The PointFastener object defines a point fastener.

The PointFastener object is derived from the *Fastener* object.

Access

```
import part
mdb.models[name].parts[name].engineeringFeatures.fasteners[name]
import assembly
mdb.models[name].rootAssembly.engineeringFeatures.fasteners[name]
```

PointFastener(...)

This method creates a PointFastener object. Although the constructor is available both for parts and for the assembly, PointFastener objects are currently supported only under the assembly.

Path

```
mdb.models[name].parts[name].engineeringFeatures.PointFastener
mdb.models[name].rootAssembly.engineeringFeatures.PointFastener
```

Required arguments

name
A String specifying the repository key.

region
A *Region* object specifying the region to which fasteners are applied.

physicalRadius
A Float specifying the physical fastener radius.

Optional arguments

directionVector
A *VertexArray* object of length 2 specifying the direction of projection. Instead of through a *Vertex*, each point might be specified through a tuple of coordinates. The default value is None.

targetSurfaces
A *RegionArray* object specifying surfaces to be fastened. The default value is MODEL.

ur1
A Boolean specifying whether to constrain the rotational displacement component about the 1-direction. The default value is ON.

ur2
A Boolean specifying whether to constrain the rotational displacement component about the 2-direction. The default value is ON.

ur3
A Boolean specifying whether to constrain the rotational displacement component about the 3-direction. The default value is ON.

attachmentMethod

A SymbolicConstant specifying the method used to locate points for attaching fasteners. Possible values are FACETOFACE, EDGETOFACE, FACETOEDGE, and EDGETOEDGE. The default value is FACETOFACE.

influenceRadius

The SymbolicConstant DEFAULT or a Float specifying the maximum distance from the projection point on a connected surface within which the nodes on that surface must lie to contribute to the motion of the projection point. If the value is DEFAULT, a radius is computed from the fastener diameter and the surface facet lengths. The default value is DEFAULT.

searchRadius

The SymbolicConstant DEFAULT or a Float specifying the distance from the positioning points within which the connected points must lie. The default value is DEFAULT.

maximumLayers

The SymbolicConstant ALL or an Int specifying the maximum number of layers for each fastener. If the value is ALL, the maximum possible number of layers within the searchRadius will be used for each fastener. The default value is ALL.

coupling

A SymbolicConstant specifying the coupling method used to couple the displacement and rotation of each attachment point to the average motion of the surface nodes within the radius of influence from the fastener projection point. Possible values are CONTINUUM and STRUCTURAL. The default value is CONTINUUM.

weightingMethod

A SymbolicConstant specifying the weighting scheme to be used to weight the contribution of the displacements of the surface nodes within the radius of influence to the motion of the fastener projection point. UNIFORM, LINEAR, QUADRATIC, and CUBIC indicate uniform, linear decreasing, quadratic polynomial decreasing, and cubic polynomial monotonic decreasing weight distributions. Possible values are UNIFORM, LINEAR, QUADRATIC, and CUBIC. The default value is UNIFORM.

adjustOrientation

A Boolean specifying whether to adjust localCsys such that the local z-axis for each fastener is normal to the surface that is closest to the reference node for that fastener. The default value is ON.

localCsys

`None` or a *DatumCsys* object specifying the local coordinate system. If *localCsys*=`None`, the global coordinate system is used. When this member is queried, it returns an Int. The default value is `None`.

connectionType

A SymbolicConstant specifying the fastener connection type. Possible values are CONNECTOR and BEAM_MPC. The default value is CONNECTOR.

sectionName

A String specifying the connector section assigned to generated connectors. The default value is an empty string.

connectorOrientationLocalCsys1

`None` or a *DatumCsys* object specifying the local coordinate system of the first connector point in generated connectors. If *connectorOrientationLocalCsys1*=`None`, the degrees of freedom are defined in the global coordinate system. When this member is queried, it returns an Int. The default value is `None`.

axis1
A SymbolicConstant specifying the axis of a datum coordinate system about which an additional rotation is applied for the first point in generated connectors. Possible values are AXIS_1, AXIS_2, and AXIS_3. The default value is AXIS_1.

angle1
A Float specifying the angle of the additional rotation for the first point in generated connectors. The default value is 0.0.

orient2SameAs1
A Boolean specifying whether or not the second connector point in generated connectors is to use the same local coordinate system, axis, and angle as the first point. The default value is ON.

connectorOrientationLocalCsys2
`None` or a *DatumCsys* object specifying the local coordinate system of the second connector point in generated connectors. If *connectorOrientationLocalCsys2*=`None`, the degrees of freedom are defined in the global coordinate system. When this member is queried, it returns an Int. The default value is `None`.

axis2
A SymbolicConstant specifying the axis of a datum coordinate system about which an additional rotation is applied for the second point in generated connectors. Possible values are AXIS_1, AXIS_2, and AXIS_3. The default value is AXIS_1.

angle2
A Float specifying the angle of the additional rotation for the second point in generated connectors. The default value is 0.0.

unsorted
A Boolean specifying whether the analysis product should leave targetSurfaces in the given unsorted order, or sort them by proximity to determine the connectivity of fastening points. The default value is OFF.

Return value

A PointFastener object.

Exceptions

None.

`setValues(...)`

This method modifies the PointFastener object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *PointFastener* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The PointFastener object has members with the same names and descriptions as the arguments to the *PointFastener* method.

In addition, the PointFastener object has the following member:

suppressed
A Boolean specifying whether the fastener is suppressed or not. The default value is OFF.

Corresponding analysis keywords

- **FASTENER*

PointMassInertia object

The PointMassInertia object defines point masses and point rotary inertia on a part or an assembly region.

The PointMassInertia object is derived from the *Inertia* object.

Access

```
import part
mdb.models[name].parts[name].engineeringFeatures.inertias[name]
import assembly
mdb.models[name].rootAssembly.engineeringFeatures.inertias[name]
```

PointMassInertia(...)

This method creates a PointMassInertia object.

Path

```
mdb.models[name].parts[name].engineeringFeatures.PointMassInertia
mdb.models[name].rootAssembly.engineeringFeatures.PointMassInertia
```

Required arguments

name
A String specifying the repository key.

region
A *Region* object specifying the region to which the mass or rotary inertia is applied.

Optional arguments

mass
A Float specifying the mass magnitude for isotropic mass. This parameter cannot be specified when anisotropic mass terms are specified. The default value is 0.0.

mass1
A Float specifying the mass in the 1-direction for anisotropic mass. This parameter cannot be specified when isotropic mass is also specified. The default value is 0.0.

mass2
A Float specifying the mass in the 2-direction for anisotropic mass. This parameter cannot be specified when isotropic mass is also specified. The default value is 0.0.

mass3
A Float specifying the mass in the 3-direction for anisotropic mass. This parameter cannot be specified when isotropic mass is also specified. The default value is 0.0.

i11
A Float specifying the rotary inertia about the local 1-axis, I_{11}. The default value is 0.0.

i22
A Float specifying the rotary inertia about the local 2-axis, I_{22}. The default value is 0.0.

i33
A Float specifying the rotary inertia about the local 3-axis, I_{33}. The default value is 0.0.

i12
A Float specifying the product of inertia, I_{12}. The default value is 0.0.

i13

A Float specifying the product of inertia, I_{13}. The default value is 0.0.

i23

A Float specifying the product of inertia, I_{23}. The default value is 0.0.

localCsys

`None` or a *DatumCsys* object specifying the local coordinate system for the anisotropic mass terms (when specified), and the rotary inertia (when specified). If *localCsys*=`None`, the anisotropic mass and rotary inertia data are defined in the global coordinate system. The default value is `None`.

alpha

A Float specifying the alpha damping magnitude. The default value is 0.0.

This argument applies only to Abaqus/Standard analyses.

composite

A Float specifying the composite damping magnitude. The default value is 0.0.

This argument applies only to Abaqus/Standard analyses.

Return value

A PointMassInertia object.

Exceptions

None.

`setValues(...)`

This method modifies the PointMassInertia object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *PointMassInertia* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The PointMassInertia object has members with the same names and descriptions as the arguments to the *PointMassInertia* method.

In addition, the PointMassInertia object has the following member:

suppressed

A Boolean specifying whether the inertia is suppressed or not. The default value is OFF.

Corresponding analysis keywords

- **MASS*, **ROTARY INERTIA*

SpringDashpot object

The SpringDashpot object is the abstract base type for the *SpringDashpotToGround* and *TwoPointSpringDashpot* objects.

Access

```
import part
mdb.models[name].parts[name].engineeringFeatures.springDashpots[name]
import assembly
mdb.models[name].rootAssembly.engineeringFeatures.springDashpots[name]
```

`resume()`

This method resumes the spring/dashpot that was previously suppressed.

Arguments

None.

Return value

`None.`

Exceptions

None.

`suppress()`

This method suppresses the spring/dashpot.

Arguments

None.

Return value

`None.`

Exceptions

None.

Members

The SpringDashpot object has the following members:

name	A String specifying the repository key.
suppressed	A Boolean specifying whether the spring/dashpot is suppressed or not. The default value is OFF.

SpringDashpotToGround object

The SpringDashpotToGround object defines springs and/or dashpots between points and ground on a part or an assembly region.

The SpringDashpotToGround object is derived from the *SpringDashpot* object.

Access

```
import part
mdb.models[name].parts[name].engineeringFeatures.springDashpots[name]
import assembly
mdb.models[name].rootAssembly.engineeringFeatures.springDashpots[name]
```

SpringDashpotToGround(...)

This method creates a SpringDashpotToGround object.

Path

```
mdb.models[name].parts[name].engineeringFeatures.SpringDashpotToGround
mdb.models[name].rootAssembly.engineeringFeatures\
.SpringDashpotToGround
```

Required arguments

name A String specifying the repository key.

region A *Region* object specifying the region to which the springs and/or dashpots are applied.

dof An Int specifying the degree of freedom associated with the spring and dashpot behaviors.

Optional arguments

orientation `None` or a *DatumCsys* object specifying the local directions for the spring and/or dashpot. If *orientation*=`None`, the spring and/or dashpot data are defined in the global coordinate system. The default value is `None`.

springBehavior A Boolean specifying whether to apply spring behavior to the selected points. The default value is OFF.

At least one of the arguments *springBehavior*=ON or *dashpotBehavior*=ON must be specified.

dashpotBehavior A Boolean specifying whether to apply dashpot behavior to the selected points. The default value is OFF.

At least one of the arguments *springBehavior*=ON or *dashpotBehavior*=ON must be specified.

springStiffness A Float specifying the force per relative displacement for the spring. The default value is 0.0.

dashpotCoefficient A Float specifying the force per relative velocity for the dashpot. The default value is 0.0.

Return value

A SpringDashpotToGround object.

Exceptions

None.

`setValues(...)`

This method modifies the SpringDashpotToGround object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *SpringDashpotToGround* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The SpringDashpotToGround object has members with the same names and descriptions as the arguments to the *SpringDashpotToGround* method.

In addition, the SpringDashpotToGround object has the following member:

suppressed A Boolean specifying whether the spring/dashpot is suppressed or not. The default value is OFF.

Corresponding analysis keywords

- **ELEMENT*, TYPE=SPRING1; **ELEMENT*, TYPE=DASHPOT1; **SPRING*; **DASHPOT*

TwoPointSpringDashpot object

The TwoPointSpringDashpot object defines springs and/or dashpots between two points on a part or an assembly.

The TwoPointSpringDashpot object is derived from the *SpringDashpot* object.

Access

```
import part
mdb.models[name].parts[name].engineeringFeatures.springDashpots[name]
import assembly
mdb.models[name].rootAssembly.engineeringFeatures.springDashpots[name]
```

TwoPointSpringDashpot(...)

This method creates a TwoPointSpringDashpot object.

Path

```
mdb.models[name].parts[name].engineeringFeatures.TwoPointSpringDashpot
mdb.models[name].rootAssembly.engineeringFeatures\
.TwoPointSpringDashpot
```

Required arguments

name
A String specifying the repository key.

regionPairs
A sequence of pairs of *Region* objects specifying the points between which the springs and/or dashpots are applied.

axis
A SymbolicConstant specifying whether the axis of the springs and/or dashpots follows the rotation of the nodes or is in a specified direction. Possible values are NODAL_LINE and FIXED_DOF.

Optional arguments

dof1
An Int specifying the degree of freedom with which the springs and/or dashpots are associated at their first points. The *dof1* argument applies only when *axis*=FIXED_DOFS. The default value is 0.

dof2
An Int specifying the degree of freedom with which the springs and/or dashpots are associated at their second points. The *dof2* argument applies only when *axis*=FIXED_DOFS. The default value is 0.

orientation
`None` or a *DatumCsys* object specifying the local directions for the spring and/or dashpot. If *orientation*=`None`, the spring and/or dashpot data are defined in the global coordinate system. The default value is `None`.

The *orientation* argument applies only when *axis*=FIXED_DOFS.

springBehavior A Boolean specifying whether to apply spring behavior to the selected point pairs. The default value is OFF.

At least one of the arguments *springBehavior*=ON or *dashpotBehavior*=ON must be specified.

dashpotBehavior A Boolean specifying whether to apply dashpot behavior to the selected point pairs. The default value is OFF.

At least one of the arguments *springBehavior*=ON or *dashpotBehavior*=ON must be specified.

springStiffness A Float specifying the force per relative displacement for the springs. The default value is 0.0.

dashpotCoefficient A Float specifying the force per relative velocity for the dashpots. The default value is 0.0.

Return value

A TwoPointSpringDashpot object.

Exceptions

None.

`setValues(...)`

This method modifies the TwoPointSpringDashpot object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *TwoPointSpringDashpot* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The TwoPointSpringDashpot object has members with the same names and descriptions as the arguments to the *TwoPointSpringDashpot* method.

In addition, the TwoPointSpringDashpot object has the following member:

suppressed A Boolean specifying whether the spring/dashpot is suppressed or not. The default value is OFF.

Corresponding analysis keywords

- **ELEMENT*, TYPE=SPRINGA; **ELEMENT*, TYPE=SPRING2; **ELEMENT*, TYPE=DASHPOTA; **ELEMENT*, TYPE=DASHPOT2; **SPRING*; **DASHPOT*

XFEMCrack object

The XFEMCrack object defines the parameters needed to model crack initiation or crack growth using XFEM technology. Currently only assembly regions are supported.

The XFEMCrack object is derived from the *Crack* object.

Access

```
import part
mdb.models[name].parts[name].engineeringFeatures.cracks[name]
import assembly
mdb.models[name].rootAssembly.engineeringFeatures.cracks[name]
```

XFEMCrack(...)

This method creates a XFEMCrack object. Although the constructor is available both for parts and for the assembly, XFEMCrack objects are currently supported only under the assembly.

Path

```
mdb.models[name].parts[name].engineeringFeatures.XFEMCrack
mdb.models[name].rootAssembly.engineeringFeatures.XFEMCrack
```

Required arguments

name
A String specifying the repository key.

crackDomain
A *Region* object specifying the region that contains the crack or is likely to contain the crack.

Optional arguments

allowCrackGrowth
A Boolean specifying whether the crack is allowed to propagate (grow). The default value is ON.

crackLocation
A *Region* object specifying the initial crack location. This parameter is required when *allowCrackGrowth*=OFF.

singularityCalcRadius
`None` or a Float specifying the radius from the crack tips within which the elements are used for crack singularity calculations. This argument applies only when *allowCrackGrowth*=OFF. The default value is `None`.

interactionProperty
A String specifying the name of the *ContactProperty* object that defines the contact properties for the crack surfaces. The default value is an empty string.

elemId
A sequence of Ints specifying the labels of the elements that are intersected by the initial crack location. This argument is used only by the input file reader.

nodeId
A sequence of Ints specifying the position of a node in the corresponding element connectivity. This argument is used only by the input file reader.

hasCrackFront
A sequence of Ints specifying the values indicating the inclusion/exclusion of the *crackFrontDist* values. A zero value indicates that *crackFrontDist* is not specified for the ith pair *elemId* and *nodeId*. This argument is used only by the input file reader.

crackPlaneDist
A sequence of Floats specifying the values of the first signed distance function. This argument is used by the input file reader.

crackFrontDist
A sequence of Floats specifying the values of the second signed distance function. This argument is used only by the input file reader.

autoDetectValue
An integer specifying the number of element layers around the crack location, to which the crack domain is shrunk.

Return value

A XFEMCrack object.

Exceptions

None.

`setValues(...)`

This method modifies the XFEMCrack object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *XFEMCrack* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The XFEMCrack object has members with the same names and descriptions as the arguments to the *XFEMCrack* method.

In addition, the XFEMCrack object has the following member:

suppressed
A Boolean specifying whether the crack is suppressed or not. The default value is OFF.

Corresponding analysis keywords

- **ENRICHMENT*
- **INITIAL CONDITIONS*, TYPE=ENRICHMENT

Imperfection object

The Imperfection object is the abstract base type for *FileImperfection*, *InputImperfection*, and *DataImperfection*.

Access

```
import assembly
mdb.models[name].rootAssembly.engineeringFeatures.imperfections[name]
```

`resume()`

This method resumes the imperfection that was previously suppressed.

Arguments

None.

Return value

`None.`

Exceptions

None.

`suppress()`

This method suppresses the imperfection.

Arguments

None.

Return value

`None.`

Exceptions

None.

Members

The Imperfection object has the following members:

name
A String specifying the repository key.

suppressed
A Boolean specifying whether the imperfection is suppressed or not. The default value is OFF.

FileImperfection object

The FileImperfection object defines geometric imperfection on an assembly region.

The FileImperfection object is derived from the *Imperfection* object.

Access

```
import assembly
mdb.models[name].rootAssembly.engineeringFeatures.imperfections[name]
```

FileImperfection(...)

This method creates a FileImperfection object.

Path

```
mdb.models[name].rootAssembly.engineeringFeatures.FileImperfection
```

Required arguments

name	A String specifying the repository key.
file	A String specifying the results file from a previous analysis from which the file imperfection is applied.
step	An Int specifying the step number (in the analysis whose file is being used as input to this option) from which the modal or displacement data are to be read.
linearSuperpositions	A sequence of sequences of Integers and Floats specifying linearSuperpositions. The items in the table data are described below.

Optional arguments

region	A *Region* object specifying the region to which the file imperfection is applied. By default, the imperfection will be applied to all nodes in the model.
increment	An Int specifying the increment number (in the analysis whose file is being used as input to this option) from which the displacement data are to be read. By default, the data will be read from the last increment available for the specified step.

Table data

The table data specify the following:

- Mode Number.
- Scaling factor for this mode.

Return value

A FileImperfection object.

Exceptions

None.

setValues(...)

This method modifies the FileImperfection object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *FileImperfection* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The FileImperfection object has members with the same names and descriptions as the arguments to the *FileImperfection* method.

In addition, the FileImperfection object has the following member:

suppressed
A Boolean specifying whether the imperfection is suppressed or not. The default value is OFF.

Corresponding analysis keywords

- **IMPERFECTION*

InputImperfection object

The InputImperfection object defines geometric imperfection on an assembly region.

The InputImperfection object is derived from the *Imperfection* object.

Access

```
import assembly
mdb.models[name].rootAssembly.engineeringFeatures.imperfections[name]
```

InputImperfection(...)

This method creates an InputImperfection object.

Path

```
mdb.models[name].parts[name].engineeringFeatures.InputImperfection
```

Required arguments

name A String specifying the repository key.

file A String specifying the name of the alternate input file containing the imperfection data.

Optional arguments

system A SymbolicConstant specifying the coordinate system. The imperfection values in the alternate input file being used as input to this option would be treated as perturbation values of respective coordinates. Possible values areR, C and S. The default value is R.

Return value

A InputImperfection object.

Exceptions

None.

setValues(...)

This method modifies the InputImperfection object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *InputImperfection* method, except for the *name* argument.

Return value

```
None.
```

Exceptions

None.

Members

The InputImperfection object has members with the same names and descriptions as the arguments to the *InputImperfection* method.

In addition, the InputImperfection object has the following member:

suppressed
A Boolean specifying whether the imperfection is suppressed or not. The default value is OFF.

Corresponding analysis keywords

- **IMPERFECTION*

DataImperfection object

The DataImperfection object defines geometric imperfection on an assembly region.

The DataImperfection object is derived from the *Imperfection* object.

Access

```
import assembly
mdb.models[name].rootAssembly.engineeringFeatures.imperfections[name]
```

DataImperfection(...)

This method creates a DataImperfection object.

Path

```
mdb.models[name].parts[name].engineeringFeatures.DataImperfection
```

Required arguments

name
A String specifying the repository key.

imperfectionTable
A sequence of sequences of Ints and Floats specifying the imperfection components at a given node. The items in the table data are described below.

Optional arguments

system
A SymbolicConstant specifying the coordinate system. The imperfection values in the data lines would be treated as perturbation values of the respective coordinates. Possible values are R, C, and S. The default value is R.

Table data

The imperfectionTable data specify the following:

- Node number.
- Component of imperfection in the first coordinate direction.
- Component of imperfection in the second coordinate direction.
- Component of imperfection in the third coordinate direction.

Return value

A DataImperfection object.

Exceptions

None.

`setValues(...)`

This method modifies the DataImperfection object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *DataImperfection* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The DataImperfection object has members with the same names and descriptions as the arguments to the *DataImperfection* method.

In addition, the DataImperfection object has the following member:

suppressed A Boolean specifying whether the imperfection is suppressed or not. The default value is OFF.

Corresponding analysis keywords

- **IMPERFCTION*

Feature commands

Features in Abaqus/CAE include Parts, Datums, Partitions, and Assembly operations.
The commands that create Feature objects on only the Part object are described in *Part commands*. The commands that create Feature objects in only the rootAssembly object are described in *Assembly commands*. The commands that create Feature objects on both the Part and the rootAssembly objects are described here.

In this section:

- *Feature object*
- *FeatureOptions object*

Feature object

Abaqus/CAE is a feature-based modeling system, and features are stored in the Feature object. The user defines the parameters of the feature, and Abaqus/CAE modifies the model based on the value of the parameters. This evaluation of the parameters is called regeneration of the feature. Feature objects contain both the parameters and the resulting model modification.

Access

```
import part
mdb.models[name].parts[name].features[name]
mdb.models[name].parts[name].featuresById[i]
import assembly
mdb.models[name].rootAssembly.features[name]
mdb.models[name].rootAssembly.featuresById[i]
```

AttachmentPoints(...)

This method creates an attachment points Feature. Attachment points may be created using datum points, vertices, reference points, attachment points, interesting points, orphan mesh nodes or coordinates. Optionally, the attachment points can be projected on geometric faces or element faces.

Path

mdb.models[*name*].parts[*name*].AttachmentPoints

mdb.models[*name*].rootAssembly.AttachmentPoints

Required arguments

name A String specifying a unique Feature name.

points A tuple of points. Each point can be a Vertex, Datum point, Reference point, Attachment point, orphan mesh Node, Interesting point object, or a tuple of Floats representing the coordinates of a point.

Optional arguments

projectionMethod A SymbolicConstant specifying the projection method. Possible values are PROJECT_BY_PROXIMITY and PROJECT_BY_DIRECTION. The default value is PROJECT_BY_PROXIMITY.

projectOnFaces A sequence of *Face* objects specifying the geometry faces onto which the points are to be projected.

projectOnElementFaces A sequence of *MeshFace* objects specifying the orphan mesh element faces onto which the points are to be projected.

projectionDirStartPt A point specifying the start point of the projection direction. The point can be a Vertex, Datum point, Reference point, Attachment point, orphan mesh Node, Interesting point object, or a tuple of Floats representing the coordinates of a point.

projectionDirEndPt A point specifying the end point of the projection direction. The point can be a Vertex, Datum point, Reference point, Attachment point, orphan mesh Node, Interesting point object, or a tuple of Floats representing the coordinates of a point.

setName A String specifying a unique set name.

Return value

A Feature object.

Exceptions

None.

AttachmentPointsAlongDirection(...)

This method creates a Feature object by creating attachment points along a direction or between two points. A Datum point, a Vertex, a Reference point, an Attachment point, an Interesting point, or an orphan mesh Node can be specified as the start or end point. The direction can be specified using a straight edge or a datum axis.

Path

mdb.models[*name*].parts[*name*].AttachmentPointsAlongDirection

mdb.models[*name*].rootAssembly.AttachmentPointsAlongDirection

Required arguments

name A String specifying a unique Feature name.

startPoint A point specifying the start point of the direction along which to create points. The point can be a Vertex, Datum point, Reference point, Attachment point, orphan mesh Node, Interesting point object, or a tuple of Floats representing the coordinates of a point.

pointCreationMethod A SymbolicConstant specifying the point creation method. Possible values are AUTO_FIT, NUM_PTS_ALONG_DIR, and NUM_PTS_BETWEEN_PTS.

Optional arguments

endPoint A point specifying the end point if creating points between two points. The point can be a Vertex, Datum point, Reference point, Attachment point, orphan mesh Node, Interesting point object, or a tuple of Floats representing the coordinates of a point.

direction The direction can be specified by a straight edge or a datum axis.

spacing A float specifying the spacing to be used between two points.

numPtsAlongDir An integer specifying the number of points to be created along the specified direction.

numPtsBetweenPts
An integer specifying the number of points to be created between the start and end points.

createPtAtStartPt
A Boolean specifying whether to create an attachment point at the start point. The default value is True.

createPtAtEndPt
A Boolean specifying whether to create an attachment point at the end point. The default value is True.

projectionMethod
A SymbolicConstant specifying the projection method. Possible values are PROJECT_BY_PROXIMITY and PROJECT_BY_DIRECTION. The default value is PROJECT_BY_PROXIMITY.

projectOnFaces
A sequence of *Face* objects specifying the geometry faces onto which the points are to be projected.

projectOnElementFaces
A sequence of *MeshFace* objects specifying the orphan mesh element faces onto which the points are to be projected.

projectionDirStartPt
A point specifying the start point of the projection direction. The point can be a Vertex, Datum point, Reference point, Attachment point, orphan mesh Node, Interesting point object, or a tuple of Floats representing the coordinates of a point.

projectionDirEndPt
A point specifying the end point of the projection direction. The point can be a Vertex, Datum point, Reference point, Attachment point, orphan mesh Node, Interesting point object, or a tuple of Floats representing the coordinates of a point.

flipDirection
A Boolean specifying if the direction along which the attachment points are created should be reversed. This argument is valid only when *pointCreationMethod*=NUM_PTS_ALONG_DIR.

setName
A String specifying a unique set name.

Return value

A Feature object.

Exceptions

None.

AttachmentPointsOffsetFromEdges(...)

This method creates a Feature object by creating attachment points along or offset from one or more connected edges.

Path

mdb.models[*name*].parts[*name*].AttachmentPointsOffsetFromEdges

mdb.models[*name*].rootAssembly.AttachmentPointsOffsetFromEdges

Required arguments

name
A String specifying a unique Feature name.

edges
A sequence of connected *Edge* objects specifying the geometry edges from which to offset the points.

Optional arguments

startPoint
A Vertex of the selected edges that specifies the point from which to create points. This point can be one of the two end vertices of the connected edges. In case of edges forming a closed loop and having multiple vertices, this point can be any one of the vertices on the edges.

flipDirection
This parameter is required to indicate the direction in which to create the points. This parameter is required only in case of edges forming a closed loop.

pointCreationMethod
A SymbolicConstant specifying the point creation method. Possible values are BY_NUMBER or BY_SPACING.

numberOfPoints
An integer specifying the number of points to be created along the selected edges.

spacingBetweenPoints
A float specifying the spacing to be used between two points while creating the points between the start and end points of the edges.

offsetFromStartPoint
A float specifying the distance by which to offset the first point from the start vertex of the edge chain. The default value is 0.0.

offsetFromEndPoint
A float specifying the distance by which to offset the last point from the end vertex of the edge chain. This parameter should be specified only if the point creation method is BY_NUMBER. The default value is 0.0.

spacingMethod
A SymbolicConstant specifying the spacing method. Possible values are AUTO_FIT_PTS or SPECIFY_NUM_PTS. The default value is AUTO_FIT_PTS.

patterningMethod
A SymbolicConstant specifying the method to pattern of points. Possible values are PATTERN_ORTHOGONALLY or PATTERN_ALONG_DIRECTION.

referenceFace
A geometry *Face* object adjacent to one of the edges from which to offset the points to create a pattern of points when the PATTERN_ORTHOGONALLY method is chosen for patterning. The face is used to identify the patterning direction. If the number of rows is one and the initial offset is zero, the reference face may not be specified.

startPointForPatternDirection
A point specifying the start point of the direction along which to create a pattern of points when the PATTERN_ALONG_DIRECTION method is chosen for patterning. The point can be a Vertex, Datum point, Reference point, Attachment point, orphan mesh Node, Interesting point object, or a tuple of Floats representing the coordinates of a point.

endPointForPatternDirection A point specifying the end point of the direction along which to create a pattern of points when the PATTERN_ALONG_DIRECTION method is chosen for patterning. The point can be a Vertex, Datum point, Reference point, Attachment point, orphan mesh Node, Interesting point object, or a tuple of Floats representing the coordinates of a point.

offsetFromEdges A float specifying the distance by which to offset the first row of points from the edges.

numberOfRows An integer specifying the number of rows of points to be created for the pattern. The default value is 1.

spacingBetweenRows A float specifying the spacing to be used between two rows while creating a pattern of points.

projectionMethod A SymbolicConstant specifying the projection method. Possible values are PROJECT_BY_PROXIMITY and PROJECT_BY_DIRECTION. The default value is PROJECT_BY_PROXIMITY.

projectOnFaces A sequence of *Face* objects specifying the geometry faces onto which the points are to be projected.

projectOnElementFaces A sequence of *MeshFace* objects specifying the orphan mesh element faces onto which the points are to be projected.

projectionDirStartPt A point specifying the start point of the projection direction. The point can be a Vertex, Datum point, Reference point, Attachment point, orphan mesh Node, Interesting point object, or a tuple of Floats representing the coordinates of a point.

projectionDirEndPt A point specifying the end point of the projection direction. The point can be a Vertex, Datum point, Reference point, Attachment point, orphan mesh Node, Interesting point object, or a tuple of Floats representing the coordinates of a point.

setName A String specifying a unique set name.

Return value

A Feature object.

Exceptions

None.

DatumAxisByCylFace(...)

This method creates a Feature object and a *DatumAxis* object along the axis of a cylinder or cone.

Path

mdb.models[*name*].rootAssembly.DatumAxisByCylFace

mdb.models[*name*].parts[*name*].DatumAxisByCylFace

Required arguments

face A cylindrical or conical Face object.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

DatumAxisByLineProjOnPlane(...)

This method creates a Feature object and a *DatumAxis* object orthogonal to the plane formed by two lines.

Path

mdb.models[*name*].rootAssembly.DatumAxisByLineProjOnPlane

mdb.models[*name*].parts[*name*].DatumAxisByLineProjOnPlane

Required arguments

line A straight Edge, a *Datum* object representing a datum axis, or an ElementEdge object specifying the line to rotate.

plane A planar Face, an ElementFace, or a *Datum* object representing a datum plane.

Optional arguments

isDependent A boolean if the datum created should be dependent or independent of its parent features.

Return value

A Feature object.

Exceptions

AbaqusException.

DatumAxisByNormalToPlane(...)

This method creates a Feature object and a *DatumAxis* object normal to the specified plane and passing through the specified point.

Path

mdb.models[*name*].rootAssembly.DatumAxisByNormalToPlane

mdb.models[*name*].parts[*name*].DatumAxisByNormalToPlane

Required arguments

plane	A planar Face, an ElementFace, or a *Datum* object representing a datum plane.
point	A Vertex, an InterestingPoint, a MeshNode, or a *Datum* object representing a datum point.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

DatumAxisByParToEdge(...)

This method creates a Feature object and a *DatumAxis* object parallel to the specified edge and passing through the specified point.

Path

mdb.models[*name*].rootAssembly.DatumAxisByParToEdge

mdb.models[*name*].parts[*name*].DatumAxisByParToEdge

Required arguments

edge	A straight Edge, an ElementEdge, or a *Datum* object representing a datum axis.
point	A Vertex, an InterestingPoint, a MeshNode, or a *Datum* object representing a datum point.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

DatumAxisByPrincipalAxis(...)

This method creates a Feature object and a *DatumAxis* object along one of the three principal axes.

Path

mdb.models[*name*].rootAssembly.DatumAxisByPrincipalAxis

mdb.models[*name*].parts[*name*].DatumAxisByPrincipalAxis

Required arguments

principalAxis A SymbolicConstant specifying the principal axis. Possible values are XAXIS, YAXIS, and ZAXIS.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

DatumAxisByRotation(...)

This method creates a Feature object and a *DatumAxis* object in a three-dimensional model by rotating a line about the specified axis through the specified angle.

Path

mdb.models[*name*].rootAssembly.DatumAxisByRotation

mdb.models[*name*].parts[*name*].DatumAxisByRotation

Required arguments

line A straight Edge, a *Datum* object representing a datum axis, or an ElementEdge object specifying the line to rotate.

axis A straight Edge, a *Datum* object representing a datum axis, or an ElementEdge object specifying the axis about which to rotate the line.

angle A Float specifying the angle in degrees to rotate the line.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

DatumAxisByRotation(...)

This method creates a Feature object and a *DatumAxis* object in a two-dimensional model by rotating a line about the specified point through the specified angle.

Path

mdb.models[*name*].rootAssembly.DatumAxisByRotation

mdb.models[*name*].parts[*name*].DatumAxisByRotation

Required arguments

line	A straight Edge, a *Datum* object representing a datum axis, or an ElementEdge object specifying the line to rotate.
point	A Vertex, an InterestingPoint, a MeshNode, or a *Datum* object representing a datum point specifying the point about which to rotate the line.
angle	A Float specifying the angle in degrees to rotate the line.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

DatumAxisByThreePoint(...)

This method creates a Feature object and a *DatumAxis* object normal to the circle described by three points and through its center.

Path

mdb.models[*name*].rootAssembly.DatumAxisByThreePoint

mdb.models[*name*].parts[*name*].DatumAxisByThreePoint

Required arguments

point1 A Vertex, an InterestingPoint, a MeshNode, or a *Datum* object representing a datum point specifying the first point on the circle.

point2 A Vertex, an InterestingPoint, a MeshNode, or a *Datum* object representing a datum point specifying the second point on the circle.

point3 A Vertex, an InterestingPoint, a MeshNode, or a *Datum* object representing a datum point specifying the third point on the circle.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

DatumAxisByThruEdge(...)

This method creates a Feature object and a *DatumAxis* object along the specified edge.

Path

mdb.models[*name*].rootAssembly.DatumAxisByThruEdge

mdb.models[*name*].parts[*name*].DatumAxisByThruEdge

Required arguments

edge A straight Edge or an ElementEdge object.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

DatumAxisByTwoLines(...)

This method creates a Feature object and a *DatumAxis* object orthogonal to the plane formed by two lines.

Path

mdb.models[*name*].rootAssembly.DatumAxisByTwoLines

mdb.models[*name*].parts[*name*].DatumAxisByTwoLines

Required arguments

line1 A straight Edge, an ElementEdge, or a *Datum* object representing a datum axis.

line2 A straight Edge, an ElementEdge, or a *Datum* object representing a datum axis.

Optional arguments

isDependent A boolean if the datum created should be dependent or independent of its parent features.

Return value

A Feature object.

Exceptions

AbaqusException.

DatumAxisByTwoPlane(...)

This method creates a Feature object and a *DatumAxis* object at the intersection of two planes.

Path

mdb.models[*name*].rootAssembly.DatumAxisByTwoPlane

mdb.models[*name*].parts[*name*].DatumAxisByTwoPlane

Required arguments

plane1 A planar Face, an ElementFace, or a *Datum* object representing a datum plane.

plane2 A planar Face, an ElementFace, or a *Datum* object representing a datum plane.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

DatumAxisByTwoPoint(...)

This method creates a Feature object and a *DatumAxis* object along the line joining two points.

Path

mdb.models[*name*].rootAssembly.DatumAxisByTwoPoint

mdb.models[*name*].parts[*name*].DatumAxisByTwoPoint

Required arguments

point1 A Vertex, an InterestingPoint, a MeshNode, or a *Datum* object representing a datum point.

point2 A Vertex, an InterestingPoint, a MeshNode, or a *Datum* object representing a datum point.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

DatumCsysByDefault(...)

This method creates a Feature object and a *DatumCsys* object from the specified default coordinate system at the origin.

Path

mdb.models[*name*].rootAssembly.DatumCsysByDefault

mdb.models[*name*].parts[*name*].DatumCsysByDefault

Required arguments

coordSysType A SymbolicConstant specifying the default coordinate system to be used. Possible values are CARTESIAN, CYLINDRICAL, and SPHERICAL.

Optional arguments

name A String specifying the name of the *DatumCsys*.

Return value

A Feature object.

Exceptions

AbaqusException.

DatumCsysByOffset(...)

This method creates a Feature object and a *DatumCsys* object by offsetting the origin of an existing datum coordinate system to a specified point.

Path

mdb.models[name].rootAssembly.DatumCsysByOffset

mdb.models[name].parts[name].DatumCsysByOffset

Required arguments

coordSysType A SymbolicConstant specifying the type of coordinate system. Possible values are CARTESIAN, CYLINDRICAL, and SPHERICAL.

datumCoordSys A *Datum* object representing a datum coordinate system from which to offset.

vector A sequence of three Floats specifying the *X*-, *Y*-, and *Z*-offsets from *datumCoordSys*. The arguments *vector* and *point* are mutually exclusive, and one of them must be specified.

point A *Vertex*, *InterestingPoint*, *DatumPoint* object or a sequence of three Floats specifying the *X*-, *Y*-, and *Z*-coordinates of a point in space. The point represents the origin of the new datum coordinate system. The arguments *vector* and *point* are mutually exclusive, and one of them must be specified.

Optional arguments

name A String specifying the name of the *DatumCsys*.

Return value

A Feature object.

Exceptions

AbaqusException.

DatumCsysByRotation(...)

This method creates a Feature object and a *DatumCsys* object by rotating an existing datum coordinate system about a given axis by a given angle.

Path

mdb.models[name].rootAssembly.DatumCsysByRotation

mdb.models[name].parts[name].DatumCsysByRotation

Required arguments

coordSysType A SymbolicConstant specifying the type of coordinate system. Possible values are CARTESIAN, CYLINDRICAL, and SPHERICAL.

datumCoordSys A *Datum* object representing a datum coordinate system from which to offset.

axis A straight Edge, an Element Edge, or a *Datum* object representing a datum axis.

angle A Float specifying the angle in degrees to rotate the plane.

Optional arguments

name A String specifying the name of the *DatumCsys*.

isOriginFixed A boolean specifying if the origin of the rotated datum coordinate system should be kept the same as the existing datum coordinate system.

isDependent A boolean if the datum created should be dependent or independent of its parent features.

Return value

A Feature object.

Exceptions

AbaqusException.

DatumCsysByThreePoints(...)

This method creates a Feature object and a *DatumCsys* object from three points.

Path

```
mdb.models[name].parts[name].DatumCsysByThreePoints
mdb.models[name].rootAssembly.DatumCsysByThreePoints
```

Required arguments

coordSysType A SymbolicConstant specifying the type of coordinate system. Possible values are CARTESIAN, CYLINDRICAL, and SPHERICAL.

origin A Vertex, an InterestingPoint, a MeshNode, or a *Datum* object representing a datum point specifying the origin of the coordinate system.

point1 A Vertex, an InterestingPoint, a MeshNode, or a *Datum* object representing a datum point specifying a point on the *X*-axis or the ***r***-axis. The *point1* and *line1* arguments are mutually exclusive. One of them must be specified.

point2
A Vertex, an InterestingPoint, a MeshNode, or a *Datum* object representing a datum point specifying a point in the *X*–*Y* plane or the r–θ plane. The *point2* and *line2* arguments are mutually exclusive. One of them must be specified.

line1
An Edge, an Element Edge, or a *Datum* object representing a datum axis specifying the *X*-axis or the r-axis. The *point1* and *line1* arguments are mutually exclusive. One of them must be specified.

line2
An Edge, an Element Edge, or a *Datum* object representing a datum axis specifying a vector in the *X*–*Y* plane or the r–θ plane. The *point2* and *line2* arguments are mutually exclusive. One of them must be specified.

Optional arguments

name
A String specifying the name of the *DatumCsys*.

Return value

A Feature object.

Exceptions

AbaqusException.

DatumCsysByTwoLines(...)

This method creates a Feature object and a *DatumCsys* object from two orthogonal lines. The origin of the new datum coordinate system is placed at the intersection of the two lines.

Path

mdb.models[*name*].rootAssembly.DatumCsysByTwoLines

mdb.models[*name*].parts[*name*].DatumCsysByTwoLines

Required arguments

coordSysType
A SymbolicConstant specifying the type of coordinate system. Possible values are CARTESIAN, CYLINDRICAL, and SPHERICAL.

line1
A straight Edge, an ElementEdge, or a *Datum* object representing a datum axis specifying the *X*-axis or the r-axis.

line2
A straight Edge, an ElementEdge, or a *Datum* object representing a datum axis specifying a line in the *X*–*Y* plane or in the r–θ plane.

Optional arguments

name
A String specifying the name of the *DatumCsys*.

Return value

A Feature object.

Exceptions

AbaqusException.

DatumPlaneByPrincipalPlane(...)

This method creates a Feature object and a *DatumPlane* object through the origin along one of the three principal planes.

Path

mdb.models[*name*].rootAssembly.DatumPlaneByPrincipalPlane

mdb.models[*name*].parts[*name*].DatumPlaneByPrincipalPlane

Required arguments

principalPlane A SymbolicConstant specifying the principal plane. Possible values are XYPLANE, YZPLANE, and XZPLANE.

offset A Float specifying the offset from the plane.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

DatumPlaneByOffset(...)

This method creates a Feature object and a *DatumPlane* object offset by a specified distance from an existing plane.

Path

mdb.models[*name*].rootAssembly.DatumPlaneByOffset

mdb.models[*name*].parts[*name*].DatumPlaneByOffset

Required arguments

plane A planar Face, an ElementFace, or a *Datum* object representing a datum plane.

flip A SymbolicConstant specifying whether the normal should be flipped. Possible values are SIDE1 and SIDE2.

offset A Float specifying the offset from the plane.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

DatumPlaneByOffset(...)

This method creates a Feature object and a *DatumPlane* object offset from an existing plane and passing through the specified point.

Path

mdb.models[*name*].rootAssembly.DatumPlaneByOffset

mdb.models[*name*].parts[*name*].DatumPlaneByOffset

Required arguments

plane A planar Face, an ElementFace, or a *Datum* object representing a datum plane.

point A Vertex, an InterestingPoint, a MeshNode, or a *Datum* object representing a datum point.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

DatumPlaneByRotation(...)

This method creates a Feature object and a *DatumPlane* object by rotating a plane about the specified axis through the specified angle.

Path

mdb.models[*name*].rootAssembly.DatumPlaneByRotation

mdb.models[*name*].parts[*name*].DatumPlaneByRotation

Required arguments

plane	A planar Face, an ElementFace, or a *Datum* object representing a datum plane.
axis	A straight Edge, an ElementEdge, or a *Datum* object representing a datum axis.
angle	A Float specifying the angle in degrees to rotate the plane.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

DatumPlaneByThreePoints(...)

This method creates a Feature object and a *DatumPlane* object defined by passing through three points.

Path

mdb.models[*name*].rootAssembly.DatumPlaneByThreePoints

mdb.models[*name*].parts[*name*].DatumPlaneByThreePoints

Required arguments

point1	A Vertex, an InterestingPoint, a MeshNode, or a *Datum* object representing a datum point.
point2	A Vertex, an InterestingPoint, a MeshNode, or a *Datum* object representing a datum point.
point3	A Vertex, an InterestingPoint, a MeshNode, or a *Datum* object representing a datum point.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

DatumPlaneByLinePoint(...)

This method creates a Feature object and a *DatumPlane* object that pass through the specified line and through the specified point that does not lie on the line.

Path

mdb.models[*name*].rootAssembly.DatumPlaneByLinePoint

mdb.models[*name*].parts[*name*].DatumPlaneByLinePoint

Required arguments

line	A straight Edge, an ElementEdge, or a *Datum* object representing a datum axis.
point	A Vertex, an InterestingPoint, a MeshNode, or a *Datum* object representing a datum point.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

DatumPlaneByPointNormal(...)

This method creates a Feature object and a *DatumPlane* object normal to the specified line and running through the specified point.

Path

mdb.models[*name*].rootAssembly.DatumPlaneByPointNormal

mdb.models[*name*].parts[*name*].DatumPlaneByPointNormal

Required arguments

point	A Vertex, an InterestingPoint, a MeshNode, or a *Datum* object representing a datum point.
normal	A straight Edge, an ElementEdge, or a *Datum* object representing a datum axis.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

DatumPlaneByTwoPoint(...)

This method creates a Feature object and a *DatumPlane* object midway between two points and normal to the line connecting the points.

Path

mdb.models[*name*].rootAssembly.DatumPlaneByTwoPoint

mdb.models[*name*].parts[*name*].DatumPlaneByTwoPoint

Required arguments

point1 A Vertex, an InterestingPoint, a MeshNode, or a *Datum* object representing a datum point.

point2 A Vertex, an InterestingPoint, a MeshNode, or a *Datum* object representing a datum point.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

DatumPointByCoordinate(...)

This method creates a Feature object and a *DatumPoint* object at the point defined by the specified coordinates.

Path

mdb.models[*name*].rootAssembly.DatumPointByCoordinate

mdb.models[*name*].parts[*name*].DatumPointByCoordinate

Required arguments

coords A sequence of three Floats specifying the *X*-, *Y*-, and *Z*-coordinates of the datum point.

Optional arguments

datumCoordSys A *Datum* object representing a local datum coordinate system.

Return value

A Feature object.

Exceptions

None.

DatumPointByLinePlaneInterSect(...)

This method creates a Feature object and a *DatumPoint* object at the intersection of a line and a plane.

Path

mdb.models[*name*].rootAssembly.DatumPointByLinePlaneIntersect

mdb.models[*name*].parts[*name*].DatumPointByLinePlaneIntersect

Required arguments

line	A straight Edge, an ElementEdge, or a *Datum* object representing a datum axis.
plane	A planar Face, an ElementFace, or a *Datum* object representing a datum plane.

Optional arguments

isDependent	A boolean if the datum created should be dependent or independent of its parent features.

Return value

A Feature object.

Exceptions

None.

DatumPointByOffset(...)

This method creates a Feature object and a *DatumPoint* object offset from an existing point by a vector.

Path

mdb.models[*name*].rootAssembly.DatumPointByOffset

mdb.models[*name*].parts[*name*].DatumPointByOffset

Required arguments

point	A Vertex, an InterestingPoint, a MeshNode, or a *Datum* object representing a datum point.
vector	A sequence of three Floats specifying the *X*-, *Y*-, and *Z*-offsets from *point*.

Optional arguments

None.

Return value

A Feature object.

Exceptions

None.

DatumPointByOffsetInDirection(...)

This method creates a Feature object and a *DatumPoint* object by offsetting a point along a given direction by a given distance.

Path

mdb.models[*name*].rootAssembly.DatumPointByOffsetInDirection

mdb.models[*name*].parts[*name*].DatumPointByOffsetInDirection

Required arguments

point	A Vertex, an InterestingPoint, a MeshNode, or a *Datum* object representing a datum point.
line	A straight Edge, an ElementEdge, or a *Datum* object representing a datum axis.
offset	A Float specifying the offset from the plane.

Optional arguments

flipDirection	A Boolean specifying if the direction along which the datum point is created should be reversed.
isDependent	A boolean if the datum created should be dependent or independent of its parent features.

Return value

A Feature object.

Exceptions

None.

DatumPointByMidPoint(...)

This method creates a Feature object and a *DatumPoint* object midway between two points.

Path

mdb.models[*name*].rootAssembly.DatumPointByMidPoint

mdb.models[*name*].parts[*name*].DatumPointByMidPoint

Required arguments

point1	A Vertex, an InterestingPoint, a MeshNode, or a *Datum* object representing a datum point.
point2	A Vertex, an InterestingPoint, a MeshNode, or a *Datum* object representing a datum point.

Optional arguments

None.

Return value

A Feature object.

Exceptions

None.

DatumPointByOnFace(...)

This method creates a Feature object and a *DatumPoint* object on the specified face, offset from two edges.

Path

mdb.models[*name*].rootAssembly.DatumPointByOnFace

mdb.models[*name*].parts[*name*].DatumPointByOnFace

Required arguments

face	A planar Face or a *Datum* object representing a datum plane.
edge1	A straight Edge or a *Datum* object representing a datum axis.
offset1	A Float specifying the offset from *edge1*.
edge2	A straight Edge or a *Datum* object representing a datum axis.
offset2	A Float specifying the offset from *edge2*.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

DatumPointByEdgeParam(...)

This method creates a Feature object and a *DatumPoint* object along an edge at a selected distance from one end of the edge.

Path

mdb.models[*name*].rootAssembly.DatumPointByEdgeParam

mdb.models[*name*].parts[*name*].DatumPointByEdgeParam

Required arguments

edge	An Edge object.
parameter	A Float specifying the distance along *edge* to the *DatumPoint* object. Possible values are 0 <*parameter*< 1.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException and RangeError.

DatumPointByProjOnEdge(...)

This method creates a Feature object and a *DatumPoint* object along an edge by projecting an existing point along the normal to the edge.

Path

mdb.models[*name*].rootAssembly.DatumPointByProjOnEdge

mdb.models[*name*].parts[*name*].DatumPointByProjOnEdge

Required arguments

point	A Vertex, an InterestingPoint, a MeshNode, or a *Datum* object representing a datum point.
edge	An Edge, an ElementEdge or a *Datum* object representing a datum axis.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

DatumPointByProjOnFace(...)

This method creates a Feature object and a *DatumPoint* object on a specified face by projecting an existing point onto the face.

Path

mdb.models[*name*].rootAssembly.DatumPointByProjOnFace

mdb.models[*name*].parts[*name*].DatumPointByProjOnFace

Required arguments

point A Vertex, an InterestingPoint, a MeshNode, or a *Datum* object representing a datum point.

face A Face object or a *Datum* object representing a datum plane.

Note:

Any other types of planes are not supported.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

MakeSketchTransform(...)

This method creates a *Transform* object. A Transform object is a 4x3 matrix of Floats that represents the transformation from sketch coordinates to part coordinates.

Path

mdb.models[*name*].parts[*name*].MakeSketchTransform

mdb.models[*name*].rootAssembly.MakeSketchTransform

Required arguments

sketchPlane	A *Datum* plane object or a planar *Face* object specifying the sketch plane.

Optional arguments

origin	A sequence of Floats specifying the *X*-, *Y*-, and *Z*-coordinates that will be used as the origin of the sketch. The default value is computed as the centroid of the face.
sketchOrientation	A SymbolicConstant specifying the orientation of *sketchUpEdge* on the sketch. Possible values are RIGHT, LEFT, TOP, and BOTTOM. The default value is RIGHT.
sketchPlaneSide	A SymbolicConstant specifying on which side of the *sketchPlane* the sketch is positioned. Possible values are SIDE1 and SIDE2. The default value is SIDE1.
sketchUpEdge	An *Edge* or *DatumAxis* object specifying the orientation of the sketch. If unspecified, the sketch is assumed to be oriented with the *Y*-direction pointing up.

Return value

A Transform object. A Transform is an object with one method that returns the transform matrix.

Exceptions

If the sketchUpEdge is parallel to the sketchPlane:	Up direction is parallel to plane normal

PartitionCellByDatumPlane(...)

This method partitions one or more cells using the given datum plane.

Path

mdb.models[*name*].parts[*name*].PartitionCellByDatumPlane

mdb.models[*name*].rootAssembly.PartitionCellByDatumPlane

Required arguments

cells	A sequence of *Cell* objects specifying the cells to partition.
datumPlane	A *DatumPlane* object.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

PartitionCellByExtendFace(...)

This method partitions one or more cells by extending the underlying geometry of a given face to partition the target cells.

Path

mdb.models[*name*].parts[*name*].PartitionCellByExtendFace

mdb.models[*name*].rootAssembly.PartitionCellByExtendFace

Required arguments

cells	A sequence of *Cell* objects specifying the cells to partition.
extendFace	A planar, cylindrical, conical, or spherical Face object.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

PartitionCellByExtrudeEdge(...)

This method partitions one or more cells by extruding selected edges in the given direction.

Path

mdb.models[*name*].parts[*name*].PartitionCellByExtrudeEdge

mdb.models[*name*].rootAssembly.PartitionCellByExtrudeEdge

Required arguments

cells	A sequence of *Cell* objects specifying the cells to partition.
edges	The *Edge* objects to be extruded. The edges must be in the same plane. The edges must form a continuous chain, without branches. The edges must belong to the same *PartInstance* object.
line	A straight *Edge* or *DatumAxis* object specifying the extrude direction. *line* must be perpendicular to the plane formed by *edges*.

sense A SymbolicConstant specifying the direction of the extrusion. Possible values are FORWARD and REVERSE. If *sense*=FORWARD, the extrusion is in the direction of *line*.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

PartitionCellByPatchNCorners(...)

This method partitions a cell using an N-sided cutting patch defined by the given corner points.

Path

mdb.models[*name*].parts[*name*].PartitionCellByPatchNCorners

mdb.models[*name*].rootAssembly.PartitionCellByPatchNCorners

Required arguments

cell A *Cell* object specifying the cell to partition.

cornerPoints A sequence of Vertex, InterestingPoint, or DatumPoint objects. $3 \leq$ len(*cornerPoints*) ≤ 5. The corner points must not coincide.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

PartitionCellByPatchNEdges(...)

This method partitions a cell using an N-sided cutting patch defined by the given edges.

Path

mdb.models[*name*].parts[*name*].PartitionCellByPatchNEdges

mdb.models[*name*].rootAssembly.PartitionCellByPatchNEdges

Required arguments

cell A *Cell* specifying the cell to partition.

edges A sequence of *Edge* objects bounding the patch. The edges must form a closed loop. The *Edge* objects must belong to the same *PartInstance* object as *cell*.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

PartitionCellByPlaneNormalToEdge(...)

This method partitions one or more cells using a plane normal to an edge at the given edge point.

Path

mdb.models[*name*].parts[*name*].PartitionCellByPlaneNormalToEdge

mdb.models[*name*].rootAssembly.PartitionCellByPlaneNormalToEdge

Required arguments

cells A sequence of *Cell* objects specifying the cells to partition.

edge An *Edge* object specifying the normal to the plane.

point A *Vertex*, *InterestingPoint*, or *DatumPoint* object specifying a point on *edge*.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

PartitionCellByPlanePointNormal(...)

This method partitions one or more cells using a plane defined by a point and a normal direction.

Path

mdb.models[*name*].parts[*name*].PartitionCellByPlanePointNormal

mdb.models[*name*].rootAssembly.PartitionCellByPlanePointNormal

Required arguments

cells	A sequence of *Cell* objects specifying the cells to partition.
point	A *Vertex*, *InterestingPoint*, or *DatumPoint* object specifying a point on the plane.
normal	A straight *Edge* or *DatumAxis* object specifying the normal to the plane.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

PartitionCellByPlaneThreePoints(...)

This method partitions one or more cells using a plane defined by three points.

Path

mdb.models[*name*].parts[*name*].PartitionCellByPlaneThreePoints

mdb.models[*name*].rootAssembly.PartitionCellByPlaneThreePoints

Required arguments

cells	A sequence of *Cell* objects specifying the cells to partition.
point1	A *Vertex*, *InterestingPoint*, or *DatumPoint* object specifying a point on the plane.
point2	A *Vertex*, *InterestingPoint*, or *DatumPoint* object specifying a point on the plane.
point3	A *Vertex*, *InterestingPoint*, or *DatumPoint* object specifying a point on the plane.

Note:

point1, *point2*, and *point3* must not be colinear and must not coincide.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

PartitionCellBySweepEdge(...)

This method partitions one or more cells by sweeping selected edges along the given sweep path.

Path

mdb.models[*name*].parts[*name*].PartitionCellBySweepEdge

mdb.models[*name*].rootAssembly.PartitionCellBySweepEdge

Required arguments

cells A sequence of *Cell* objects specifying the cells to partition.

edges A sequence of *Edge* objects to be swept. The edges must be in the same plane. The edges must form a continuous chain without branches. The Edge objects must all belong to the same *PartInstance* object.

sweepPath An *Edge* object specifying the sweep path. The start of *sweepPath* must be in the plane and perpendicular to the plane formed by *edges*. The sweep path must be planar.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

PartitionEdgeByDatumPlane(...)

This method partitions an edge where it intersects with a datum plane.

Path

mdb.models[*name*].parts[*name*].PartitionEdgeByDatumPlane

mdb.models[*name*].rootAssembly.PartitionEdgeByDatumPlane

Required arguments

edges A sequence of Edge objects specifying the edges to partition.

datumPlane A *DatumPlane* object specifying the location of the partition.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

PartitionEdgeByParam(...)

This method partitions one or more edges at the given normalized edge parameter.

Path

mdb.models[*name*].parts[*name*].PartitionEdgeByParam

mdb.models[*name*].rootAssembly.PartitionEdgeByParam

Required arguments

edges A sequence of Edge objects specifying the edges to partition.

parameter A Float specifying the normalized distance along *edge* at which to partition. Possible values are 0.0 <*parameter*< 1.0.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

PartitionEdgeByPoint(...)

This method partitions an edge at the given point.

Path

mdb.models[*name*].parts[*name*].PartitionEdgeByPoint

mdb.models[*name*].rootAssembly.PartitionEdgeByPoint

Required arguments

edge An Edge object specifying the edge to partition.

point An *InterestingPoint* or *DatumPoint* object specifying a point on *edge*.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

PartitionFaceByAuto(...)

This method automatically partitions a target face into simple regions that can be meshed using a structured meshing technique.

Path

mdb.models[*name*].parts[*name*].PartitionFaceByAuto

mdb.models[*name*].rootAssembly.PartitionFaceByAuto

Required arguments

face A *Face* object specifying the face to partition.

Optional arguments

None.

Return value

A Feature object.

Exceptions

None.

PartitionFaceByCurvedPathEdgeParams(...)

This method partitions a face normal to two edges, using a curved path between the two given edge points defined by the normalized edge parameters.

Path

mdb.models[*name*].parts[*name*].PartitionFaceByCurvedPathEdgeParams

mdb.models[*name*].rootAssembly.PartitionFaceByCurvedPathEdgeParams

Required arguments

face	A *Face* object specifying the face to partition.
edge1	An *Edge* object specifying the start of the partition. The edge must belong to *face*.
parameter1	A Float specifying the distance along *edge1* at which to partition. Possible values are 0.0 ≤*distance1*≤ 1.0.
edge2	An *Edge* object specifying the end of the partition. The edge must belong to *face*.
parameter2	A Float specifying the distance along *edge2* at which to partition. Possible values are 0.0 ≤*distance2*≤ 1.0.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

PartitionFaceByCurvedPathEdgePoints(...)

This method partitions a face normal to two edges, using a curved path between the two given edge points.

Path

mdb.models[*name*].parts[*name*].PartitionFaceByCurvedPathEdgePoints

mdb.models[*name*].rootAssembly.PartitionFaceByCurvedPathEdgePoints

Required arguments

face	A *Face* object specifying the face to partition.
edge1	An *Edge* object specifying the start of the partition. The edge must belong to *face*.
point1	A *Vertex*, *InterestingPoint*, or *DatumPoint* object specifying a point on *edge1*.
edge2	An *Edge* object specifying the end of the partition. The edge must belong to *face*.
point2	A *Vertex*, *InterestingPoint*, or *DatumPoint* object specifying a point on *edge2*.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

PartitionFaceByDatumPlane(...)

This method partitions one or more faces using the given datum plane.

Path

mdb.models[*name*].parts[*name*].PartitionFaceByDatumPlane

mdb.models[*name*].rootAssembly.PartitionFaceByDatumPlane

Required arguments

faces A sequence of *Face* objects specifying the faces to partition.

datumPlane A *DatumPlane* object specifying the location of the partition.

Optional arguments

None.

Return value

A Feature object.

Exceptions

None.

PartitionFaceByExtendFace(...)

This method partitions one or more faces by extending the underlying geometry of another given face to partition the target faces.

Path

mdb.models[*name*].parts[*name*].PartitionFaceByExtendFace

mdb.models[*name*].rootAssembly.PartitionFaceByExtendFace

Required arguments

faces A sequence of *Face* objects specifying the faces to partition.

extendFace A *Face* object that is to be extended to create the partition. The face to extend can be a planar, cylindrical, conical, or spherical face.

Optional arguments

None.

Return value

A Feature object.

Exceptions

None.

PartitionFaceByIntersectFace(...)

This method partitions one or more faces using the given cutting faces to partition the target faces.

Path

mdb.models[*name*].parts[*name*].PartitionFaceByIntersectFace

mdb.models[*name*].rootAssembly.PartitionFaceByIntersectFace

Required arguments

faces A sequence of *Face* objects specifying the faces to partition.

cuttingFaces A sequence of Face objects that specify the cutting faces.

Optional arguments

None.

Return value

A Feature object.

Exceptions

None.

PartitionFaceByProjectingEdges(...)

This method partitions one or more faces by projecting the given edges on the target faces.

Path

mdb.models[*name*].parts[*name*].PartitionFaceByProjectingEdges

mdb.models[*name*].rootAssembly.PartitionFaceByProjectingEdges

Required arguments

faces A sequence of *Face* objects specifying the faces to partition.

edges A sequence of *Edge* objects specifying the edges that will be projected onto the target faces.

Optional arguments

extendEdges A boolean specifying whether to extend the given edges at their free ends in the tangent direction before partitioning the target faces. The default value is False.

Return value

A Feature object.

Exceptions

None.

PartitionFaceByShortestPath(...)

This method partitions one or more faces using a minimum distance path between the two given points.

Path

mdb.models[*name*].parts[*name*].PartitionFaceByShortestPath

mdb.models[*name*].rootAssembly.PartitionFaceByShortestPath

Required arguments

faces A sequence of *Face* objects specifying the face to partition.

point1 A *Vertex*, *InterestingPoint*, or *DatumPoint* object.

point2 A *Vertex*, *InterestingPoint*, or *DatumPoint* object.

Note:

point1 and *point2* must not coincide, and they must both lie on the underlying surface geometry of at least one of the target faces.

Optional arguments

None.

Return value

A Feature object.

Exceptions

AbaqusException.

PartitionFaceBySketch(...)

This method partitions one or more planar faces by sketching on them.

Path

mdb.models[*name*].parts[*name*].PartitionFaceBySketch

mdb.models[*name*].rootAssembly.PartitionFaceBySketch

Required arguments

faces A sequence of *Face* objects specifying the faces to partition.

sketch A *ConstrainedSketch* object specifying the partition.

Optional arguments

sketchUpEdge An *Edge* or *DatumAxis* object specifying the orientation of *sketch*. This edge or datum axis must not be orthogonal to the plane defined by *faces*. If unspecified, *sketch* is assumed to be oriented in with the *Y* direction pointing up.

sketchOrientation A SymbolicConstant specifying the orientation of *sketchUpEdge* on the sketch. Possible values are RIGHT, LEFT, TOP, and BOTTOM. The default value is RIGHT.

Return value

A Feature object.

Exceptions

AbaqusException.

PartitionFaceBySketchDistance(...)

This method partitions one or more faces by sketching on a sketch plane and then projecting the sketch toward the target faces through the given distance.

Path

mdb.models[*name*].parts[*name*].PartitionFaceBySketchDistance

mdb.models[*name*].rootAssembly.PartitionFaceBySketchDistance

Required arguments

faces A sequence of *Face* objects specifying the faces to partition.

sketchPlane A planar Face or DatumPlane object.

sketchPlaneSide A SymbolicConstant specifying the side of the plane to be used for sketching. Possible values are SIDE1 and SIDE2.

sketchUpEdge An Edge object specifying the orientation of *sketch*. This edge must not be orthogonal to *sketchPlane*.

sketch A *ConstrainedSketch* object specifying the partition.

distance A Float specifying the projection distance. Possible values are *distance*> 0.0.

Optional arguments

sketchOrientation A SymbolicConstant specifying the orientation of *sketchUpEdge* on the sketch. Possible values are RIGHT, LEFT, TOP, and BOTTOM. The default value is RIGHT.

Return value

A Feature object.

Exceptions

AbaqusException.

PartitionFaceBySketchRefPoint(...)

This method partitions one or more faces by sketching on a sketch plane and then projecting the sketch toward the target faces through a distance governed by the reference point.

Path

mdb.models[*name*].parts[*name*].PartitionFaceBySketchRefPoint

mdb.models[*name*].rootAssembly.PartitionFaceBySketchRefPoint

Required arguments

faces A sequence of *Face* objects specifying the faces to partition.

sketchPlane A planar Face or DatumPlane object.

sketchUpEdge An *Edge* object or a DatumAxis object specifying the orientation of *sketch*. This edge or datum axis must not be orthogonal to *sketchPlane*.

sketch A *ConstrainedSketch* object specifying the partition.

point A *Vertex*, *InterestingPoint*, or *DatumPoint* object specifying the distance to project *sketch*. The point must not lie on *sketchPlane*.

Optional arguments

sketchOrientation A SymbolicConstant specifying the orientation of *sketchUpEdge* on the sketch. Possible values are RIGHT, LEFT, TOP, and BOTTOM. The default value is RIGHT.

Return value

A Feature object.

Exceptions

AbaqusException.

PartitionFaceBySketchThruAll(...)

This method partitions one or more faces by sketching on a sketch plane and then projecting toward the target faces through an infinite distance.

Path

mdb.models[*name*].parts[*name*].PartitionFaceBySketchThruAll

mdb.models[*name*].rootAssembly.PartitionFaceBySketchThruAll

Required arguments

faces A sequence of *Face* objects specifying the faces to partition.

sketchPlane A planar Face or DatumPlane object.

sketchPlaneSide A SymbolicConstant specifying the extrude direction of the sketch. Possible values are SIDE1 and SIDE2.

sketchUpEdge An *Edge* or a DatumAxis object specifying the orientation of *sketch*. This edge or datum axis must not be orthogonal to *sketchPlane*.

sketch A *ConstrainedSketch* object specifying the partition.

Optional arguments

sketchOrientation A SymbolicConstant specifying the orientation of *sketchUpEdge* on the sketch. Possible values are RIGHT, LEFT, TOP, and BOTTOM. The default value is RIGHT.

Return value

A Feature object.

Exceptions

AbaqusException.

ReferencePoint(...)

This method creates a Feature object and a *ReferencePoint* object at the specified location.

Path

mdb.models[*name*].rootAssembly.ReferencePoint

mdb.models[*name*].parts[name].ReferencePoint

Required arguments

point A *Vertex*, *InterestingPoint*, a *MeshNode*, or a *Datum* object specifying a reference point. *point* can also be a sequence of three Floats representing the *X*-, *Y*-, and *Z*-coordinates of the point.

Optional arguments

instanceName Used internally by the input file writer.

Return value

A Feature Object.

Exceptions

None.

RemoveWireEdges(...)

This method removes wire edges.

Path

mdb.models[*name*].parts[*name*].RemoveWireEdges

mdb.models[*name*].rootAssembly.RemoveWireEdges

Required arguments

wireEdgeList A sequence of Edge objects specifying the edges to remove. Any specified edge that is not a wire edge will not be removed.

Optional arguments

None.

Return value

A Feature object.

Exceptions

None.

WirePolyLine(...)

This method creates an additional Feature object by creating a series of wires joining points in pairs. When such a feature is created at the Part level, then each point can be either a datum point, a vertex, a reference point, an interesting point, an orphan mesh node, or the coordinates of a point. When such a feature is created at the Assembly level, then each point can only be a vertex, a reference point, or an orphan mesh node.

Path

mdb.models[*name*].parts[*name*].WirePolyLine

mdb.models[*name*].rootAssembly.WirePolyLine

Required arguments

points A tuple of point pairs, each pair being itself represented by a tuple. For part level features each point can be a Vertex, Datum point, Reference point, orphan mesh Node, or InterestingPoint object specifying the points through which the polyline wire will pass. Each point can also be a tuple of Floats representing the coordinates of a point. For assembly level features each point can only be a Vertex, Reference point, or orphan mesh Node specifying the points through which the polyline wire will pass (coordinates cannot be specified). In any of the pairs, the first or second point can be NONE. In that case, the point pair will create a zero-length wire, which is required for certain types of connectors. You must specify at least one pair.

Optional arguments

mergeType A SymbolicConstant specifying the merge behavior of the wire with existing geometry. If *mergeType* is MERGE, Abaqus merges the wire into solid regions of the part if the wire passes through them. If *mergeType* is IMPRINT, Abaqus imprints the wire on existing geometry as edges. If *mergeType* is SEPARATE, Abaqus neither merges nor imprints the spline wire with existing geometry. It creates the wire separately. The default value is IMPRINT.

meshable A Boolean specifying whether the wire should be available for selection for meshing operations. If *meshable*=OFF, the wire can be used for connector section assignment. The default value is ON.

Return value

A Feature object.

Exceptions

None.

`isSuppressed()`

This method queries the suppressed state of the feature.

Arguments

None.

Return value

A Boolean value of True if the feature is suppressed and False if it is not suppressed.

Exceptions

None.

restore()

This method restores the parameters of a feature to the value they had when the `backup` method was invoked on the part or assembly. Use the `restore` method after the `backup` method.

Arguments

None.

Return value

```
None.
```

Exceptions

None.

resume()

This method resumes suppressed features. Resuming a feature fully restores it to the part or assembly. You can resume the last feature you suppressed, all suppressed features, or just selected features. When you resume a child feature, Abaqus/CAE also resumes the parent features automatically.

Arguments

None.

Return value

```
None.
```

Exceptions

None.

setValues(...)

This method modifies the Feature object.

Required arguments

None.

Optional arguments

parameter A Float specifying the normalized distance along *edge* at which to partition. Possible values are 0.0 <*parameter*< 1.0. You use this argument to modify a partition created with the created with the PartitionEdgeByParam method.

parameter1 A Float specifying the distance along *edge1* at which to partition. Possible values are 0.0 ≤*parameter1*≤ 1.0. You use this argument to modify a partition object created with the PartitionFaceByCurvedPathEdgeParam method.

parameter2 A Float specifying the distance along *edge2* at which to partition. Possible values are 0.0 ≤*parameter2*≤ 1.0. You use this argument to modify a partition object created with the PartitionFaceByCurvedPathEdgeParam method.

sketch A *ConstrainedSketch* object specifying the partition. You use this argument to modify a partition object created with a sketch; for example, using the PartitionFaceBySketch method.

distance A Float specifying the projection *distance*. Possible values are *distance*> 0.0. You use this argument to modify a partition object created with the PartitionFaceBySketchDistance method.

Return value

`None.`

Exceptions

AbaqusException.

`suppress()`

This method suppresses features. Suppressing a feature is equivalent to temporarily removing the feature from the part or assembly. Suppressed features remain suppressed when you regenerate a part or assembly. You cannot suppress the base feature. In addition, if you suppress a parent feature, all of its child features are also suppressed automatically. Suppressed features can be restored with the `resume` command.

Arguments

None.

Return value

`None.`

Exceptions

None.

Members

The Feature object has the following members:

name A String specifying the repository key.

id

An Int specifying the ID of the feature.

FeatureOptions object

The FeatureOptions object stores the options that control the behavior of feature regeneration for all features in a model.

Access

```
import part
mdb.models[name].featureOptions
```

`setValues(...)`

This method modifies the FeatureOptions object for the specified model.

Required arguments

None.

Optional arguments

checkSelfIntersection
A Boolean specifying whether Abaqus/CAE should perform self-intersection checks while regenerating features. The default value is ON.

autoCaching
A Boolean specifying whether geometric states should be automatically cached. The default value is ON.

maxCachedStates
An Int specifying the maximum number of caches to be stored with each part or with the assembly. The default value is 5.

Return value

`None.`

Exceptions

None.

Members

The FeatureOptions object has members with the same names and descriptions as the arguments to the *setValues* method.

Field commands

A Field object stores the non-propagating data of a field as well as a number of instances of the corresponding FieldState object.
The FieldState object stores the propagating data of the field in a single step. A specific type of Field object and a specific type of FieldState object are designed for each type of predefined field. Instances of the FieldState object are created and deleted internally by its corresponding Field object.

In this section:

- *Field object*
- *AnalyticalField object*
- *DataTable object*
- *DiscreteField object*
- *ExpressionField object*
- *MappedField object*
- *OdbMeshRegionData object*

Field object

The Field object is the abstract base type for other Field objects. The Field object has no explicit constructor. The methods and members of the Field object are common to all objects derived from the Field.

Access

```
import fields
```

Members

The Field object can have the following members:

name	A String specifying the repository key.
description	A String specifying the description of the field. The default value is an empty string.

AnalyticalField object

The AnalyticalField object is the abstract base type for other AnalyticalField objects. The AnalyticalField object has no explicit constructor. The methods and members of the AnalyticalField object are common to all objects derived from the AnalyticalField.

The AnalyticalField object is derived from the *Field* object.

Access

```
import fields
mdb.models[name].analyticalFields[name]
```

Members

The AnalyticalField object can have the following members:

name
A String specifying the repository key.

localCsys
`None` or a *DatumCsys* object specifying the local coordinate system of the field. If *localCsys*=`None`, the field is defined in the global coordinate system. The default value is `None`.

description
A String specifying the description of the field. The default value is an empty string.

DataTable object

A DataTable is an object used to define the domain and data for a *DiscreteField*.

Access

```
import field
mdb.models[name].discreteFields[name].data[i]
```

Members

The DataTable object has the following members:

dataWidth An Int specifying the width of the data. Valid widths are 1, 6, 21, corresponding to scalar data, orientations and 4D tensors.

name A String specifying the index.

instanceName A String specifying the instance name.

domain A tuple of Ints specifying the domain node, element or integration point identifiers.

table A tuple of Floats specifying the data within the domain.

DiscreteField object

The DiscreteField object defines a varying field whose values correspond to distinct points within a domain.

The DiscreteField object is derived from the *Field* object.

Access

```
import fields
mdb.models[name].discreteFields[name]
```

DiscreteField(...)

This method creates a DiscreteField object.

Path

```
mdb.models[name].DiscreteField
```

Required arguments

name A String specifying the repository key.

defaultValues A sequence of Floats specifying a sequence of floats specifying the default values.

fieldType A SymbolicConstant or an Int specifying the type of data represented by this discrete field. Possible values are SCALAR, ORIENTATION, and PRESCRIBEDCONDITION_DOF.

Optional arguments

location A SymbolicConstant or an Int specifying the location of the domain data. Possible values are NODES and ELEMENTS. The default value is NODES.

dataWidth An Int specifying the width of the supplied data. The default value is 1.

data A *DataTableArray* object.

description A String specifying the description of the field. The default value is an empty string.

orientationType A SymbolicConstant specifying the type of the system being described by a discrete field used for an orientation. Possible values are CARTESIAN, CYLINDRICAL, and SPHERICAL. The default value is CARTESIAN.

partLevelOrientation A Boolean specifying whether or not the orientations are described in terms of part level coordinates. The default value is OFF.

Return value

A DiscreteField object.

Exceptions

AbaqusException.

DiscreteFieldByVolumeFraction(...)

This method creates a DiscreteField object that represents the volume fraction of each element of an Eulerian Instance that is occupied by a reference instance.

Path

mdb.models[*name*].rootAssembly.DiscreteFieldByVolumeFraction

Required arguments

name	A String specifying the repository key.
eulerianInstance	A *PartInstance* object specifying the elements for which volume fraction values will be computed.
referenceInstance	A *PartInstance* object specifying the region that either contains material or is empty of material.

Optional arguments

accuracy	A Symbolic Constant specifying the level of accuracy that will be used in computing volume fractions. Possible values are LOW, MEDIUM, or HIGH. The default value is MEDIUM.
materialLocation	A Symbolic Constant indicating whether the material is inside or outside the *referenceInstance*. Possible values are INSIDE or OUTSIDE. The default value is INSIDE.
description	A String specifying the description of the field. The default value is an empty string.
scaleFactor	A float specifying the fraction of the volume that is occupied by the *referenceInstance*. Valid values are between 0 and 1.

Return value

A DiscreteField object.

Exceptions

AbaqusException.

DiscreteFieldFromAnalytic(...)

This method creates a DiscreteField object from a *AnalyticalField* object.

Path

```
mdb.models[name].DiscreteFieldFromAnalytic
```

Required arguments

name	A String specifying the repository key.
location	A SymbolicConstant or an Int specifying the location of the domain data. Possible values are NODES and ELEMENTS. The default value is NODES.
analyticFieldName	A String specifying the name of the *AnalyticalField* containing the source data.
region	A *Region* object for the field.

Optional arguments

None.

Return value

A DiscreteField object.

Exceptions

AbaqusException.

`setValues(...)`

This method modifies the DiscreteField object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *DiscreteField* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The DiscreteField object has members with the same names and descriptions as the arguments to the *DiscreteField* method.

ExpressionField object

The ExpressionField object defines a spatially varying field whose value is calculated from a user-supplied mathematical expression.

The ExpressionField object is derived from the *AnalyticalField* object.

Access

```
import fields
mdb.models[name].analyticalFields[name]
```

ExpressionField(...)

This method creates an ExpressionField object.

Path

```
mdb.models[name].ExpressionField
```

Required arguments

name A String specifying the repository key.

expression A String specifying the Python expression to evaluate in space. Variables are X, Y, and Z; R, Th, and Z; or R, Th, and P based on the selected coordinate system.

Optional arguments

localCsys `None` or a *DatumCsys* object specifying the local coordinate system of the field. If *localCsys*=`None`, the field is defined in the global coordinate system. The default value is `None`.

description A String specifying the description of the field. The default value is an empty string.

Return value

An ExpressionField object.

Exceptions

TextException.

setValues(...)

This method modifies the ExpressionField object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ExpressionField* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The ExpressionField object has members with the same names and descriptions as the arguments to the *ExpressionField* method.

MappedField object

The MappedField object defines a spatially varying field whose value is calculated from an external source data.

The MappedField object is derived from the *AnalyticalField* object.

Access

```
import fields
mdb.models[name].analyticalFields[name]
```

MappedField(...)

This method creates an MappedField object.

Path

```
mdb.models[name].MappedField
```

Required arguments

name
A String specifying the repository key.

Optional arguments

regionType
A SymbolicConstant specifying the data source region type. It can be either an ODB mesh or a cloud of points. Possible values are MESH and POINT. The default value is POINT.

partLevelData
A Boolean specifying whether or not the point cloud source data are described in terms of part level coordinates. If part level coordinates is employed, the local coordinate system defined in *localCsys* will be ignored. The default value is OFF.

pointDataFormat
A SymbolicConstant specifying point cloud source data format. Possible values are GRID and XYZ. The default value is XYZ.

gridPointPlane
A SymbolicConstant specifying the plane on which the point cloud source data of grid format are described. Possible values are XYPLANE, YZPLANE, and XZPLANE. The default value is XYPLANE.

defaultUnMappedValue
A Float specifying the parameter (field) value reported when a value cannot be calculated from the data source. The default value is 0.0.

mappingAlgorithm
A SymbolicConstant specifying the mapping algorithm for target surface, or on mesh target model when the parameter value are located at nodes, for example nodal temperatures. Possible values are SURFACE and VOLUMETRIC. The default value is SURFACE.

searchTolType
A SymbolicConstant specifying searching tolerance type in terms of absolute value or a fraction of the average of all element characteristic length in target model region. Possible values are ABSOLUTE and RELATIVE. The default value is RELATIVE.

boundarySearchTol
A Float specifying the search distance tolerance value on the exterior boundary of target model region. Source points within this distance will be included in computing the parameter value of target region. This tolerance applies to both surface and volumetric mapping. The default value is 0.01.

neighborhoodSearchTol
A Float specifying the search distance tolerance value used for distance weighting algorithm. Source points within this distance will be included in computing the parameter value of target region. This tolerance only applies to surface mapping. The default value is 1000000.0.

negativeNormalSearchTol
A Float specifying the search distance tolerance value in the negative normal of target surface region. Source points within this distance will be included in computing the parameter value of target region. This tolerance only applies to surface mapping. The default value is 0.15.

positiveNormalSearchTol
A Float specifying the search distance tolerance value in the positive normal of target surface region. Source points within this distance will be included in computing the parameter value of target region. This tolerance only applies to surface mapping. The default value is 0.05.

scaleCoordinates
A Boolean specifying whether or not to scale the user-supplied coordinate values from the point cloud or indicated ODB. The default value is OFF.

gridPointData
A sequence of sequences of Floats specifying the point cloud source data of grid format. The default value is an empty sequence.

xyzPointData
A sequence of sequences of Floats specifying the point cloud source data of XYZ format. Each data item is defining the XYZ coordinates of a point and its field value. The default value is an empty sequence.

coordinateScalingFactors
A sequence of Floats specifying the scaling factors for the global 1, 2 and 3 directions. The default value is (1.0, 1.0, 1.0).

localCsys
`None` or a *DatumCsys* object specifying the local coordinate system of the field. If *localCsys*=`None`, the field is defined in the global coordinate system. The default value is `None`.

description
A String specifying the description of the field. The default value is an empty string.

Return value

A MappedField object.

Exceptions

AbaqusException.

`setValues(...)`

This method modifies the MappedField object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *MappedField* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The MappedField object has the following members:

name

A String specifying the repository key.

regionType

A SymbolicConstant specifying the data source region type. It can be either an ODB mesh or a cloud of points. Possible values are MESH and POINT. The default value is POINT.

partLevelData

A Boolean specifying whether or not the point cloud source data are described in terms of part level coordinates. If part level coordinates is employed, the local coordinate system defined in *localCsys* will be ignored. The default value is OFF.

pointDataFormat

A SymbolicConstant specifying point cloud source data format. Possible values are GRID and XYZ. The default value is XYZ.

gridPointPlane

A SymbolicConstant specifying the plane on which the point cloud source data of grid format are described. Possible values are XYPLANE, YZPLANE, and XZPLANE. The default value is XYPLANE.

defaultUnMappedValue

A Float specifying default parameter (field) value of target model region while its value cannot be calculated from the data source. The default value is 0.0.

mappingAlgorithm

A SymbolicConstant specifying the mapping algorithm for target surface, or on mesh target model when the parameter value are located at nodes, for example nodal temperatures. Possible values are SURFACE and VOLUMETRIC. The default value is SURFACE.

searchTolType

A SymbolicConstant specifying searching tolerance type in terms of absolute value or a fraction of the average of all element characteristic length in target model region. Possible values are ABSOLUTE and RELATIVE. The default value is RELATIVE.

boundarySearchTol

A Float specifying the search distance tolerance value on the exterior boundary of target model region. Source points within this distance will be included in computing the

parameter value of target region. This tolerance applies to both surface and volumetric mapping. The default value is 0.01.

neighborhoodSearchTol

A Float specifying the search distance tolerance value used for distance weighting algorithm. Source points within this distance will be included in computing the parameter value of target region. This tolerance only applies to surface mapping. The default value is 1000000.0.

negativeNormalSearchTol

A Float specifying the search distance tolerance value in the negative normal of target surface region. Source points within this distance will be included in computing the parameter value of target region. This tolerance only applies to surface mapping. The default value is 0.15.

positiveNormalSearchTol

A Float specifying the search distance tolerance value in the positive normal of target surface region. Source points within this distance will be included in computing the parameter value of target region. This tolerance only applies to surface mapping. The default value is 0.05.

scaleCoordinates

A Boolean specifying whether or not to scale the user-supplied coordinate values from the point cloud or indicated ODB. The default value is OFF.

gridPointData

A tuple of tuples of Floats specifying the point cloud source data of grid format. The default value is an empty sequence.

xyzPointData

A tuple of tuples of Floats specifying the point cloud source data of XYZ format. Each data item is defining the XYZ coordinates of a point and its field value. The default value is an empty sequence.

odbMeshRegionData

An *OdbMeshRegionData* object specifying the external source data from ODB mesh region.

coordinateScalingFactors

A tuple of Floats specifying the scaling factors for the global 1, 2 and 3 directions. The default value is (1.0, 1.0, 1.0).

localCsys

`None` or a *DatumCsys* object specifying the local coordinate system of the field. If *localCsys*=`None`, the field is defined in the global coordinate system. The default value is `None`.

description

A String specifying the description of the field. The default value is an empty string.

OdbMeshRegionData object

The OdbMeshRegionData object defines the external source data of *MappedField* from an ODB file.

Access

```
import
field
mdb.models[name].analyticalFields[name].odbMeshRegionData
```

OdbMeshRegionData(...)

This method creates an OdbMeshRegionData object.

Path

```
mdb.models[name].analyticalFields[name].OdbMeshRegionData
```

Required arguments

odbFileName

A String specifying the name of the output database file (including the .odb extension) to be read into as the source data. This String can also be the full path to the output database file if it is located in another directory.

variableLabel

A String specifying the field output variable.

Optional arguments

stepIndex

An Int specifying the step index. Possible values are $0 \le stepIndex \le (numSteps - 1)$. The default value is 0.

frameIndex

An Int specifying the frame in the specified step. Valid values are $0 \le frameIndex \le (numFramesInStep - 1)$. The default value is 0.

outputPosition

A SymbolicConstant specifying the position where the data is written in the output database. Data can be obtained only from the position at which it was written to the output database during the analysis. This position should be aligned with the field output variable. Possible values are:

- UNDEFINED_POSITION
- NODAL
- INTEGRATION_POINT
- ELEMENT_FACE
- ELEMENT_NODAL
- ELEMENT_CENTROID
- WHOLE_ELEMENT
- WHOLE_REGION
- WHOLE_PART_INSTANCE

- WHOLE_MODEL
- GENERAL_PARTICLE

The default value is UNDEFINED_POSITION.

dataType

A SymbolicConstant specifying the data type of the field output variable which should be aligned with the variable. Currently only SCALAR is supported. Possible values are:

- ENUMERATION
- BOOLEAN
- INTEGER
- SCALAR
- VECTOR
- QUATERNION_2D
- QUATERNION_3D
- TENSOR
- TENSOR_3D_FULL
- TENSOR_3D_PLANAR
- TENSOR_3D_SURFACE
- TENSOR_2D_PLANAR
- TENSOR_2D_SURFACE

The default value is SCALAR.

storageType

A SymbolicConstant specifying the storage type of the field output variable which should be aligned with the variable. Possible values are FLOAT, DOUBLE, INTEGER, and BOOLEAN. The default value is FLOAT.

quantityToPlot

A SymbolicConstant specifying the quantity to plot. Currently only FIELD_OUTPUT is supported. Possible values are FIELD_OUTPUT and DISCONTINUITIES. The default value is FIELD_OUTPUT.

averageElementOutput

A Boolean specifying whether to average the element output. The default value is OFF.

useRegionBoundaries

A Boolean specifying whether to use region boundaries when averaging. The default value is OFF.

regionBoundaries

A SymbolicConstant specifying the type of averaging region boundaries. Currently only NONE and ODB_REGIONS are supported. Possible values are NONE, ODB_REGIONS, ELEMENT_SET, and DISPLAY_GROUPS. The default value is NONE.

includeFeatureBoundaries

A Boolean specifying whether to include additional averaging boundaries for shells and membranes based on feature edges. The default value is ON.

featureAngle

A Float specifying the feature angle to be used when *includeFeatureBoundaries*=ON. The default value is 20.0.

averageOnlyDisplayed

A Boolean specifying whether to average only values on displayed elements. The default value is OFF.

averagingThreshold

A Float specifying the nodal averaging threshold percentage. 0 ≤*averagingThreshold*≤100. The default value is 75.0.

computeOrder

A SymbolicConstant specifying the order or the computations to be performed on the interested field output variable. Possible values are EXTRAPOLATE_AVERAGE_COMPUTE, EXTRAPOLATE_COMPUTE_AVERAGE, EXTRAPOLATE_COMPUTE, EXTRAPOLATE_COMPUTE_DISCONTINUITIES, and RAW_DATA. The default value is EXTRAPOLATE_COMPUTE_AVERAGE.

numericForm

A SymbolicConstant specifying the numeric form in which to display results that contain complex numbers. Possible values are COMPLEX_MAGNITUDE, COMPLEX_PHASE, REAL, IMAGINARY, and COMPLEX_MAG_AT_ANGLE. The default value is REAL.

complexAngle

A Float specifying the angle (in degrees) at which to display results that contain complex numbers when *numericForm=COMPLEX_MAG_AT_ANGLE*=COMPLEX_MAG_AT_ANGLE. The default value is 0.0.

sectionPoint

A Dictionary with String keys and String values. Each key specifies a region in the model; the corresponding value specifies a section point within that region. For example:

```
                    sectionPoint={'shell < MAT > < 7 section
 points >':'SPOS,
                     (fraction = 1.0)', 'shell < MAT > < 5
section points >':
                     'SPOS, (fraction = 1.0)', }
```

refinementType

A SymbolicConstant specifying the type of the FieldOutput object. Possible values for the SymbolicConstant are NO_REFINEMENT, INVARIANT and COMPONENT. Default argument is NO_REFINEMENT. *refinementType* is mandetory if *variableLabel* has an INVARIANT or a COMPONENT.

refinementLabel

A String specifying the Label of FieldOutput object. This is required only if the *refinementType* is INVARIANT or COMPONENT.

displayOutputPosition

A SymbolicConstant specifying the position from which to obtain the data. Possible values are NODAL, INTEGRATION_POINT, ELEMENT_FACE, ELEMENT_NODAL, ELEMENT_CENTROID, WHOLE_ELEMENT, WHOLE_REGION, WHOLE_PART_INSTANCE, WHOLE_MODEL, and GENERAL_PARTICLE.

Return value

An OdbMeshRegionData object.

Exceptions

TextException.

setValues(...)

This method modifies the OdbMeshRegionData object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *OdbMeshRegionData* method.

Return value

`None.`

Exceptions

None.

Members

The OdbMeshRegionData object has the following members:

stepIndex

An Int specifying the step index. Possible values are $0 \le stepIndex \le (numSteps - 1)$. The default value is 0.

frameIndex

An Int specifying the frame in the specified step. Valid values are $0 \le frameIndex \le (numFramesInStep - 1)$. The default value is 0.

outputPosition

A SymbolicConstant specifying the position from which to obtain data. Data can be obtained only from the position at which they were written to the output database during the analysis. This position should be aligned with the field output variable. Possible values are:

- UNDEFINED_POSITION
- NODAL
- INTEGRATION_POINT
- ELEMENT_FACE
- ELEMENT_NODAL
- ELEMENT_CENTROID
- WHOLE_ELEMENT
- WHOLE_REGION
- WHOLE_PART_INSTANCE
- WHOLE_MODEL
- GENERAL_PARTICLE

The default value is UNDEFINED_POSITION.

dataType

A SymbolicConstant specifying the data type of the field output variable which should be aligned with the variable. Currently only SCALAR is supported. Possible values are:

- ENUMERATION
- BOOLEAN
- INTEGER
- SCALAR
- VECTOR
- QUATERNION_2D
- QUATERNION_3D
- TENSOR
- TENSOR_3D_FULL
- TENSOR_3D_PLANAR
- TENSOR_3D_SURFACE
- TENSOR_2D_PLANAR
- TENSOR_2D_SURFACE

The default value is SCALAR.

storageType

A SymbolicConstant specifying the storage type of the field output variable which should be aligned with the variable. Possible values are FLOAT, DOUBLE, INTEGER, and BOOLEAN. The default value is FLOAT.

quantityToPlot

A SymbolicConstant specifying the quantity to plot. Currently only FIELD_OUTPUT is supported. Possible values are FIELD_OUTPUT and DISCONTINUITIES. The default value is FIELD_OUTPUT.

averageElementOutput

A Boolean specifying whether to average the element output. The default value is OFF.

useRegionBoundaries

A Boolean specifying whether to use region boundaries when averaging. The default value is OFF.

regionBoundaries

A SymbolicConstant specifying the type of averaging region boundaries. Currently only NONE and ODB_REGIONS are supported. Possible values are NONE, ODB_REGIONS, ELEMENT_SET, and DISPLAY_GROUPS. The default value is NONE.

includeFeatureBoundaries

A Boolean specifying whether to include additional averaging boundaries for shells and membranes based on feature edges. The default value is ON.

featureAngle

A Float specifying the feature angle to be used when *includeFeatureBoundaries*=ON. The default value is 20.0.

averageOnlyDisplayed

A Boolean specifying whether to average only values on displayed elements. The default value is OFF.

averagingThreshold

A Float specifying the nodal averaging threshold percentage. 0 ≤*averagingThreshold*≤100. The default value is 75.0.

computeOrder

A SymbolicConstant specifying the order or the computations to be performed on the interested field output variable. Possible values are EXTRAPOLATE_AVERAGE_COMPUTE, EXTRAPOLATE_COMPUTE_AVERAGE, EXTRAPOLATE_COMPUTE, EXTRAPOLATE_COMPUTE_DISCONTINUITIES, and RAW_DATA. The default value is EXTRAPOLATE_COMPUTE_AVERAGE.

numericForm

A SymbolicConstant specifying the numeric form in which to display results that contain complex numbers. Possible values are COMPLEX_MAGNITUDE, COMPLEX_PHASE, REAL, IMAGINARY, and COMPLEX_MAG_AT_ANGLE. The default value is REAL.

complexAngle

A Float specifying the angle (in degrees) at which to display results that contain complex numbers when *numericForm=COMPLEX_MAG_AT_ANGLE*=COMPLEX_MAG_AT_ANGLE. The default value is 0.0.

odbFileName

A String specifying the name of the output database file (including the .odb extension) to be read into as the source data. This String can also be the full path to the output database file if it is located in another directory.

variableLabel

A String specifying the field output variable.

displayOutputPosition

A SymbolicConstant specifying the position where the output is displayed in the viewport. Possible values are:

- UNDEFINED_POSITION
- NODAL
- INTEGRATION_POINT
- ELEMENT_FACE
- ELEMENT_NODAL
- ELEMENT_CENTROID
- WHOLE_ELEMENT
- WHOLE_REGION
- WHOLE_PART_INSTANCE
- WHOLE_MODEL
- GENERAL_PARTICLE

The default value is UNDEFINED_POSITION.

Field Report commands

Field report commands are used to write a field output report and free body computational results to an ASCII file.

In this section:

- *FieldReportOptions object*
- *FreeBodyReportOptions object*
- *OdbFieldVarList object*
- *OdbModelFieldVarList object*
- *writeFieldReport*
- *writeFreeBodyReport*

FieldReportOptions object

The FieldReportOptions object stores settings used by the `writeFieldReport` method when you write a *FieldOutput* object to an ASCII file. The FieldReportOptions object has no constructor. Abaqus creates the *fieldReportOptions* member when you import the Visualization module.

Access

```
import visualization
session.defaultFieldReportOptions
session.fieldReportOptions
```

`setValues(...)`

This method modifies the FieldReportOptions object.

Required arguments

None.

Optional arguments

numColumns
An Int specifying the number of columns to display for the tabular report. The default value is 80.

numberFormat
A *NumberFormat* object specifying the format type, number of digits and precision used to print the numeric output.

printXYData
A Boolean specifying whether to include *X*–*Y* data values in the tabular report. The default value is ON.

printTotal
A Boolean specifying whether to include column totals in the tabular report. The default value is ON.

printMinMax
A Boolean specifying whether to include column summary minimum and maximum values in the tabular report. The default value is ON.

pageWidth
A SymbolicConstant specifying how the width of the tabular report is to be determined. Possible values are NO_LIMIT and SPECIFY. The default value is NO_LIMIT.

separateTables
A Boolean specifying whether to present a separate tabular report for each output variable. The default value is OFF.

sort
A SymbolicConstant specifying the order in which values are to be sorted within a tabular report. Possible values are ASCENDING and DESCENDING. The default value is ASCENDING.

printLocalCSYS
A Boolean specifying whether to include the local coordinate system values in the tabular report. The default value is OFF.

Return value

A FieldReportOptions object.

Exceptions

None.

Members

The FieldReportOptions object has members with the same names and descriptions as the arguments to the *setValues* method.

FreeBodyReportOptions object

The FreeBodyReportOptions object stores settings used by the `writeFreeBodyReport` method when you write free body computational results to an ASCII file. The FreeBodyReportOptions object has no constructor. Abaqus creates the *freeBodyReportOptions* member when you import the Visualization module.

Access

```
import visualization
session.defaultFreeBodyReportOptions
session.freeBodyReportOptions
```

`setValues(...)`

This method modifies the FreeBodyReportOptions object.

Required arguments

None.

Optional arguments

numDigits	An Int specifying the number of decimal places. The default value is 3.
forceThreshold	A Float specifying the threshold value for force. The default value is 10^{-6}.
momentThreshold	A Float specifying the threshold value for moment. The default value is 10^{-6}.
numberFormat	A SymbolicConstant specifying the number format. Possible values are SCIENTIFIC, FIXED, and ENGINEERING. The default value is SCIENTIFIC.
reportFormat	A SymbolicConstant specifying the report format. Possible values are NORMAL_ANNOTATED and COMMA_SEPARATED_VALUES. The default value is NORMAL_ANNOTATED.
csysType	A SymbolicConstant specifying the coordinate system type. Possible values are GLOBAL and LOCAL. The default value is GLOBAL.

Return value

A FreeBodyReportOptions object.

Exceptions

None.

Members

The FreeBodyReportOptions object has members with the same names and descriptions as the arguments to the *setValues* method.

OdbFieldVarList object

The read-only OdbFieldVarList object is a sequence listing all variables available for the current step and frame. Each item in the sequence is itself a sequence fully describing the given variable.

Access

```
import visualization
session.viewports[name].layers[name].odbDisplay.fieldVariables
session.viewports[name].odbDisplay.fieldVariables
```

Members

The OdbFieldVarList object has no members.

OdbModelFieldVarList object

The read-only OdbModelFieldVarList object lists all variables available for the model in the current *OdbDisplay* object.

Access

```
import visualization
session.viewports[name].layers[name].odbDisplay.modelVariableList
session.viewports[name].odbDisplay.modelVariableList
```

Members

The OdbModelFieldVarList object has no members.

writeFieldReport

This command writes a field output report to a file.

writeFieldReport

This method writes a FieldOutput object to a user-defined ASCII file.

Path

session.writeFieldReport

Required arguments

filename A String specifying the name of the file to which field output will be written.

append A Boolean specifying whether to append the field output to an existing file. The default value is ON.

sortItem A String specifying the item by which to sort the tabular values.

odb An Odb object from which to obtain field output values.

step An Int (or stepIndex) specifying the step from which to obtain field output values. Possible values are $0 \leq step \leq (numSteps - 1)$.

frame An Int (or frameIndex) specifying the frame from which to obtain field output values. Possible values are $0 \leq frame \leq (numFramesInStep - 1)$.

outputPosition A SymbolicConstant specifying the position from which to obtain data. Possible values are NODAL, INTEGRATION_POINT, ELEMENT_FACE, ELEMENT_NODAL, ELEMENT_CENTROID, WHOLE_ELEMENT, WHOLE_REGION, WHOLE_PART_INSTANCE, WHOLE_MODEL, and GENERAL_PARTICLE.

displayGroup A DisplayGroup object specifying the subset of the model for which to obtain data.

variable A sequence of variable description sequences specifying one or more field output variables for which to obtain data. Each variable description sequence contains the following elements:

- *element0*: A String specifying the name of the variable.
- *element1*: A SymbolicConstant specifying the output position at which to report data. Possible values are ELEMENT_CENTROID, ELEMENT_FACE, ELEMENT_NODAL, GENERAL_PARTICLE, INTEGRATION_POINT, NODAL, WHOLE_ELEMENT, WHOLE_MODEL, WHOLE_PART_INSTANCE, and WHOLE_REGION.
- *element2*: A Sequence of tuples each consisting of a SymbolicConstant specifying the refinement (COMPONENT or INVARIANT), followed by a String specifying the name of a component or invariant for which to obtain values.

  If this element is omitted, data are written for all components and invariants (if applicable). This element is required if *element3* (the following element in the tuple) is included.

- *element3 (if applicable)*: A Dictionary with a String key and a String value specifying a single section point at which to report data. The key specifies a region in the model; the corresponding value specifies a section point within that region. For example:

```
{'shell < MAT > < 7 section points >':'SPOS,
    (fraction = 1.0)'}
```

  If this element is omitted, data are written for all section points (if applicable).

Optional arguments

numericForm

A SymbolicConstant specifying the numeric form in which to display results that contain complex numbers. Possible values are COMPLEX_MAGNITUDE, COMPLEX_PHASE, REAL, IMAGINARY, and COMPLEX_MAG_AT_ANGLE. The initial value is COMPLEX_MAGNITUDE.

complexAngle

A Float specifying the angle (in degrees) at which to display results that contain complex numbers when *numericForm*=COMPLEX_MAG_AT_ANGLE. The initial value is 0.

stepFrame

A SymbolicConstant indicating whether to obtain the values from the specified frame or from all active frames. Possible values are SPECIFY and ALL. The default value is SPECIFY.

Return value

`None.`

Exceptions

None.

writeFreeBodyReport

This command writes a free body output report to a file.

writeFreeBodyReport

This method writes a FreeBody object to a user-defined ASCII file.

Path

session.writeFreeBodyReport

Required arguments

fileName A String specifying the name of the file to which the free body output will be written.

append A Boolean specifying whether to append the free body output to an existing file. The default value is ON.

Optional arguments

step An Int identifying the step from which to obtain values. The default value is the current step.

frame An Int identifying the frame from which to obtain values. The default value is the current frame.

stepFrame A SymbolicConstant indicating whether to obtain the values from the specified frame or from all active frames. Possible values are SPECIFY and ALL. The default value is SPECIFY.

odb An Odb object specifying the output database from which data will be read.

Filter commands

Filter commands are used to create real-time filters of output request data.

In this section:

- *Filter object*
- *ButterworthFilter object*
- *Chebyshev1Filter object*
- *Chebyshev2Filter object*
- *OperatorFilter object*

Filter object

The Filter object is the abstract base type for other Filter objects. The Filter object has no explicit constructor. The methods and members of the Filter object are common to all objects derived from the Filter.

Access

```
import filter
mdb.models[name].filters[name]
import odbFilter
session.odbs[name].filters[name]
```

Members

The Filter object has the following members:

name

A String specifying the repository key. This name ANTIALIASING is reserved for filters generated internally by the program.

cutoffFrequency

A Float specifying the attenuation point of the filter. Possible values are non-negative numbers. Order is not available for OperatorFilter.

order

An Int specifying the highest power of the filter transfer function. Possible values are non-negative numbers less than or equal to 20. Order is not available for OperatorFilter. The default value is 2.

operation

A SymbolicConstant specifying the filter operator. Possible values are NONE, MIN, MAX, and ABS. The default value is NONE.

halt

A Boolean specifying whether to stop the analysis if the specified limit is reached. The default value is OFF.

limit

`None` or a Float specifying the threshold limit, an upper or lower bound for output values depending on the operation, or a bound for stopping the analysis when Halt is used. The default value is `None`.

invariant

A SymbolicConstant specifying the invariant to which filtering is applied. Possible values are NONE, FIRST, and SECOND. The default value is NONE.

ButterworthFilter object

The ButterworthFilter object defines a Butterworth type filter.

The ButterworthFilter object is derived from the *Filter* object.

Access

```
import filter
mdb.models[name].filters[name]
import odbFilter
session.odbs[name].filters[name]
```

ButterworthFilter(...)

This method creates a ButterworthFilter object.

Path

```
mdb.models[name].ButterworthFilter
session.odbs[name].ButterworthFilter
```

Required arguments

name
A String specifying the repository key. This name ANTIALIASING is reserved for filters generated internally by the program.

cutoffFrequency
A Float specifying the attenuation point of the filter. Possible values are non-negative numbers. Order is not available for OperatorFilter.

Optional arguments

order
An Int specifying the highest power of the filter transfer function. Possible values are non-negative numbers less than or equal to 20. Order is not available for OperatorFilter. The default value is 2.

operation
A SymbolicConstant specifying the filter operator. Possible values are NONE, MIN, MAX, and ABS. The default value is NONE.

halt
A Boolean specifying whether to stop the analysis if the specified limit is reached. The default value is OFF.

limit
`None` or a Float specifying the threshold limit, an upper or lower bound for output values depending on the operation, or a bound for stopping the analysis when Halt is used. The default value is `None`.

invariant
A SymbolicConstant specifying the invariant to which filtering is applied. Possible values are NONE, FIRST, and SECOND. The default value is NONE.

Return value

A ButterworthFilter object.

Exceptions

InvalidNameError and RangeError.

`setValues(...)`

This method modifies the ButterworthFilter object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ButterworthFilter* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The ButterworthFilter object has members with the same names and descriptions as the arguments to the *ButterworthFilter* method.

Corresponding analysis keywords

- **FILTER*

Chebyshev1Filter object

The Chebyshev1Filter object defines a Chebyshev type 1 filter.

The Chebyshev1Filter object is derived from the *Filter* object.

Access

```
import filter
mdb.models[name].filters[name]
import odbFilter
session.odbs[name].filters[name]
```

Chebyshev1Filter(...)

This method creates a Chebyshev1Filter object.

Path

```
mdb.models[name].Chebyshev1Filter
session.odbs[name].Chebyshev1Filter
```

Required arguments

name
A String specifying the repository key. This name ANTIALIASING is reserved for filters generated internally by the program.

cutoffFrequency
A Float specifying the attenuation point of the filter. Possible values are non-negative numbers. Order is not available for OperatorFilter.

Optional arguments

rippleFactor
A Float specifying the amount of allowable ripple in the filter. Possible values are non-negative numbers. The default value is 0.225.

order
An Int specifying the highest power of the filter transfer function. Possible values are non-negative numbers less than or equal to 20. Order is not available for OperatorFilter. The default value is 2.

operation
A SymbolicConstant specifying the filter operator. Possible values are NONE, MIN, MAX, and ABS. The default value is NONE.

halt
A Boolean specifying whether to stop the analysis if the specified limit is reached. The default value is OFF.

limit
`None` or a Float specifying the threshold limit, an upper or lower bound for output values depending on the operation, or a bound for stopping the analysis when Halt is used. The default value is `None`.

invariant
A SymbolicConstant specifying the invariant to which filtering is applied. Possible values are NONE, FIRST, and SECOND. The default value is NONE.

Return value

A Chebyshev1Filter object.

Exceptions

InvalidNameError and RangeError.

setValues(...)

This method modifies the Chebyshev1Filter object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Chebyshev1Filter* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The Chebyshev1Filter object has members with the same names and descriptions as the arguments to the *Chebyshev1Filter* method.

Corresponding analysis keywords

- **FILTER*

Chebyshev2Filter object

The Chebyshev2Filter object defines a Chebyshev type 2 filter.

The Chebyshev2Filter object is derived from the *Filter* object.

Access

```
import filter
mdb.models[name].filters[name]
import odbFilter
session.odbs[name].filters[name]
```

Chebyshev2Filter(...)

This method creates a Chebyshev2Filter object.

Path

```
mdb.models[name].Chebyshev2Filter
session.odbs[name].Chebyshev2Filter
```

Required arguments

name A String specifying the repository key. This name ANTIALIASING is reserved for filters generated internally by the program.

cutoffFrequency A Float specifying the attenuation point of the filter. Possible values are non-negative numbers. Order is not available for OperatorFilter.

Optional arguments

rippleFactor A Float specifying the amount of allowable ripple in the filter. Possible values are non-negative numbers less than 1. The default value is 0.025.

order An Int specifying the highest power of the filter transfer function. Possible values are non-negative numbers less than or equal to 20. Order is not available for OperatorFilter. The default value is 2.

operation A SymbolicConstant specifying the filter operator. Possible values are NONE, MIN, MAX, and ABS. The default value is NONE.

halt A Boolean specifying whether to stop the analysis if the specified limit is reached. The default value is OFF.

limit `None` or a Float specifying the threshold limit, an upper or lower bound for output values depending on the operation, or a bound for stopping the analysis when Halt is used. The default value is `None`.

invariant A SymbolicConstant specifying the invariant to which filtering is applied. Possible values are NONE, FIRST, and SECOND. The default value is NONE.

Return value

A Chebyshev2Filter object.

Exceptions

InvalidNameError and RangeError.

setValues(...)

This method modifies the Chebyshev2Filter object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Chebyshev2Filter* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The Chebyshev2Filter object has members with the same names and descriptions as the arguments to the *Chebyshev2Filter* method.

Corresponding analysis keywords

- **FILTER*

OperatorFilter object

The OperatorFilter object defines an operator filter.

The OperatorFilter object is derived from the *Filter* object.

Access

```
import filter
mdb.models[name].filters[name]
import odbFilter
session.odbs[name].filters[name]
```

OperatorFilter(...)

This method creates an OperatorFilter object.

Path

```
mdb.models[name].OperatorFilter
session.odbs[name].OperatorFilter
```

Required arguments

name
A String specifying the repository key. This name ANTIALIASING is reserved for filters generated internally by the program.

cutoffFrequency
A Float specifying the attenuation point of the filter. Possible values are non-negative numbers. Order is not available for OperatorFilter.

Optional arguments

order
An Int specifying the highest power of the filter transfer function. Possible values are non-negative numbers less than or equal to 20. Order is not available for OperatorFilter. The default value is 2.

operation
A SymbolicConstant specifying the filter operator. Possible values are NONE, MIN, MAX, and ABS. The default value is NONE.

halt
A Boolean specifying whether to stop the analysis if the specified limit is reached. The default value is OFF.

limit
`None` or a Float specifying the threshold limit, an upper or lower bound for output values depending on the operation, or a bound for stopping the analysis when Halt is used. The default value is `None`.

invariant
A SymbolicConstant specifying the invariant to which filtering is applied. Possible values are NONE, FIRST, and SECOND. The default value is NONE.

Return value

An OperatorFilter object.

Exceptions

InvalidNameError and RangeError.

`setValues(...)`

This method modifies the OperatorFilter object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *OperatorFilter* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The OperatorFilter object has members with the same names and descriptions as the arguments to the *OperatorFilter* method.

Corresponding analysis keywords

- **FILTER*

Input File Parser commands

The `inpParser` module provides functions that allow you to parse an Abaqus input file.

In this section:

- *InputFile object*
- *Keyword object*
- *AbaqusNDarray object*

InputFile object

The InputFile object is used to store the definitions in an Abaqus input file. InputFile objects can be created using the methods described in this section.

Access

```
import inpParser
```

InputFile(...)

This method creates an InputFile object by reading an Abaqus input file.

Path

inpParser.InputFile

Required arguments

file A String specifying the path to the input file.

Optional arguments

directory A String specifying the path to the directory containing the input file.

Return value

An InputFile object.

Exceptions

None.

parse(...)

This method parses the input file associated with the InputFile object.

Optional arguments

organize A Boolean specifying whether keywords should be organized into suboptions. The default is False.

verbose A Boolean specifying whether verbose output is to be printed. If *verbose* is True, information about fatal errors is printed. If no fatal errors occur, there is no output. The default is False.

bulk A Boolean specifying whether the input file includes bulk data that should be parsed. The default is True.

usePyArray A Boolean specifying that parse method can return an AbaqusNDarray object for a keyword data value. In cases where large amounts of numerical data (i.e., large node arrays) are expected, it is recommended that you use the option `usePyArray=True`. The default is False.

Return value

A KeywordSequence object.

Exceptions

If you parse an input file more than once, a ValueError is raised for each subsequent parsing.

Members

The InputFile object has the following members:

file A String specifying the source file name of the Abaqus input file.

directory A String specifying the directory where the input file is located.

includes A sequence of Strings specifying any additional input files included in the specified input file.

missingIncludes A sequence of Strings for input files included in the specified input file that could not be located.

Keyword object

The Keyword object is used to store a keyword definition from an Abaqus input file.

Keyword objects are returned via the `InputFile.parse()` method.

Access

```
import inpParser
```

Members

The InputFile object has the following members:

name
A String specifying the name of the keyword.

parameter
A Dictionary of Strings specifying the keyword parameters.

data
A sequence of sequences or an AbaqusNDarray object specifying the keyword data. The type of the leaf objects depends on the keyword. The AbaqusNDarray object is returned only if the data is suitable and if the `InputFile.parse()` method was called with the option `usePyArray=True`. In cases where large amounts of numerical data (i.e., large node arrays) are expected, it is recommended that you use the option `usePyArray=True`.

suboptions
A KeywordSequence specifying the suboptions of the keyword.

comments
A sequence of Strings specifying the comments.

AbaqusNDarray object

The AbaqusNDarray object is a sequence object derived from `numpy.ndarray` and is used to store numeric keyword data from an Abaqus input file. This object is similar to the `numpy.ndarray` object, but the numeric elements are returned as standard Python objects, not `numpy` numeric types.

The numeric elements can be:

- All ints.
- All floats.
- First column int, all other columns floats.

In the last of these cases, the member *colZeroIsInt* will be True; in the other two cases, it will be False.

Interaction commands

A specific type of interaction object and a specific type of interaction state object are designed for each type of interaction.
An interaction object stores the non-propagating data of an interaction as well as a number of instances of the corresponding interaction state object, each of which stores the propagating data of the interaction in a single step. Instances of the interaction state object are created and deleted internally by its corresponding interaction object.

In this section:

- *Interaction object*
- *AcousticImpedance object*
- *AcousticImpedanceProp object*
- *AcousticImpedanceState object*
- *ActuatorSensor object*
- *ActuatorSensorProp object*
- *ActuatorSensorState object*

Interaction object

The Interaction object is the abstract base type for other Interaction objects. The Interaction object has no explicit constructor. Each of the Interaction objects has the following methods:

- `deactivate`
- `move`
- `reset`
- `resume`
- `suppress`
- `delete`

The methods are described below.

Access

```
import interaction
mdb.models[name].interactions[name]
```

`deactivate(...)`

This method deactivates the interaction in the specified step and all its subsequent steps.

Required arguments

stepName A String specifying the name of the step in which the interaction is deactivated.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`move(...)`

This method moves an interaction from one step to another.

Required arguments

fromStepName A String specifying the name of the step from which to move the interaction.

toStepName A String specifying the name of the step to which to move the interaction.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`reset(...)`

This method reactivates an interaction that was deactivated previously. The `reset` method is available during the step in which the interaction was deactivated originally.

Required arguments

stepName	A String specifying the name of the step in which the interaction is reactivated.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`resume()`

This method resumes an interaction that was previously suppressed.

Arguments

None.

Return value

`None.`

Exceptions

None.

`suppress()`

This method suppresses an interaction.

Arguments

None.

Return value
`None.`

Exceptions

None.

`delete(...)`

This method allows you to delete existing interactions.

Required arguments

indices A sequence of Ints specifying the index of each interaction to delete.

Optional arguments

None.

Return value
`None.`

Exceptions

None.

Members

The Interaction object has the following member:

name A String specifying the repository key.

AcousticImpedance object

The AcousticImpedance object defines surface impedance information or nonreflecting boundaries for acoustic and coupled acoustic-structural analyses.

The AcousticImpedance object is derived from the *Interaction* object.

Access

```
import interaction
mdb.models[name].interactions[name]
```

AcousticImpedance(...)

This method creates an AcousticImpedance object.

Path

```
mdb.models[name].AcousticImpedance
```

Required arguments

name
A String specifying the repository key.

createStepName
A String specifying the name of the step in which the AcousticImpedance object is created.

surface
A *Region* object specifying the acoustic boundary surface.

Optional arguments

definition
A SymbolicConstant specifying the type of acoustic impedance to be defined. Possible values are TABULAR and NONREFLECTING. The default value is TABULAR.

interactionProperty
A String specifying the *AcousticImpedanceProp* object associated with this interaction.

nonreflectingType
A SymbolicConstant specifying the type of nonreflecting geometry to be defined. Possible values are PLANE, IMPROVED, CIRCULAR, SPHERICAL, ELLIPTICAL, and PROLATE. The default value is PLANE.

This argument is valid only when *definition*=NONREFLECTING.

radius
A Float specifying the radius of the circle or sphere defining the boundary surface. The default value is 1.0.

This argument is valid only when *definition*=NONREFLECTING, and *nonreflectingType*=CIRCULAR or SPHERICAL.

semimajorAxis
A Float specifying the semimajor axis length of the ellipse or prolate spheroid defining the boundary surface. The default value is 1.0.

This argument is valid only when *definition*=NONREFLECTING, and *nonreflectingType*=ELLIPTICAL or PROLATE.

eccentricity

A Float specifying the eccentricity of the ellipse or prolate spheroid defining the boundary surface. The default value is 0.0.

This argument is valid only when *definition*=NONREFLECTING, and *nonreflectingType*=ELLIPTICAL or PROLATE.

centerCoordinates

A sequence of three Floats specifying the X, Y, and Z coordinates of the center of the ellipse or prolate spheroid defining the boundary surface. The default value is (0, 0, 0).

This argument is valid only when *definition*=NONREFLECTING, and *nonreflectingType*=ELLIPTICAL or PROLATE.

directionCosine

A sequence of three Floats specifying the X, Y, and Z components of the direction cosine of the major axis of the ellipse or prolate spheroid defining the boundary surface. The default value is (0, 0, 1).

This argument is valid only when *definition*=NONREFLECTING, and *nonreflectingType*=ELLIPTICAL or PROLATE.

Return value

An AcousticImpedance object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing AcousticImpedance object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *AcousticImpedance* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing AcousticImpedance object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the interaction is modified.

Optional arguments

interactionProperty A String specifying the *AcousticImpedanceProp* object associated with this interaction.

Return value

`None.`

Exceptions

None.

Members

The AcousticImpedance object has members with the same names and descriptions as the arguments to the *AcousticImpedance* method except the optional arguments to the *setValuesInStep* method.

Corresponding analysis keywords

- **SIMPEDANCE*

AcousticImpedanceProp object

The AcousticImpedanceProp object is an interaction property that defines the properties referred to by an *AcousticImpedance* object.

The AcousticImpedanceProp object is derived from the *InteractionProperty* object.

Access

```
import interaction
mdb.models[name].interactionProperties[name]
```

AcousticImpedanceProp(...)

This method creates an AcousticImpedanceProp object.

Path

```
mdb.models[name].AcousticImpedanceProp
```

Required arguments

name
A String specifying the interaction property repository key.

tableType
A SymbolicConstant specifying the type of tabular data to be defined. Possible values are IMPEDANCE and ADMITTANCE.

table
A sequence of sequences of Floats specifying acoustic impedance properties.

If *tableType*=IMPEDANCE, each sequence of the table data specifies:

- The real part of the complex impedance.
- The imaginary part of the complex impedance.
- Frequency, if the data depend on frequency.

If *tableType*=ADMITTANCE, each sequence of the table data specifies:

- The real part of the complex admittance.
- The imaginary part of the complex admittance.
- Frequency, if the data depend on frequency.

Optional arguments

frequencyDependency
A Boolean specifying whether the *table* data depend on frequency. The default value is OFF.

Return value

An AcousticImpedanceProp object.

Exceptions

None.

setValues(...)

This method modifies the AcousticImpedanceProp object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *AcousticImpedanceProp* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The AcousticImpedanceProp object has members with the same names and descriptions as the arguments to the *AcousticImpedanceProp* method.

Corresponding analysis keywords

- **IMPEDANCE PROPERTY*

AcousticImpedanceState object

The AcousticImpedanceState object stores the propagating data of an *AcousticImpedance* object in a step. One instance of this object is created internally by the *AcousticImpedance* object for each step. The instance is also deleted internally by the *AcousticImpedance* object.

The AcousticImpedanceState object has no constructor or methods.

The AcousticImpedanceState object is derived from the *InteractionState* object.

Access

```
import interaction
mdb.models[name].steps[name].interactionStates[name]
```

Members

The AcousticImpedanceState object has the following members:

interactionPropertyState

A SymbolicConstant specifying the propagation state of the *interactionProperty* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

interactionProperty

A String specifying the name of the *AcousticImpedanceProp* object associated with this interaction.

status

A SymbolicConstant specifying the propagation state of the *InteractionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

Corresponding analysis keywords

- **SIMPEDANCE*

ActuatorSensor object

The ActuatorSensor object defines a single point actuator where the actuation is determined by a user subroutine (*UEL*). The subroutine senses the data at the same point as the actuator.

The ActuatorSensor object is derived from the *Interaction* object.

Access

```
import interaction
mdb.models[name].interactions[name]
```

ActuatorSensor(...)

This method creates an ActuatorSensor object.

Path

```
mdb.models[name].ActuatorSensor
```

Required arguments

name	A String specifying the repository key.
createStepName	A String specifying the name of the step in which the actuator/sensor interaction is created. *createStepName* must be set to 'Initial'.
point	A *Region* object specifying the point at which the constraint is applied.
interactionProperty	A String specifying the *ActuatorSensorProp* object associated with this interaction.
noCoordComponents	An Int specifying the number of coordinate components supplied to the user subroutine (*UEL*).
unsymm	A Boolean specifying whether the element matrices are symmetric (ON) or unsymmetric (OFF). The default value is OFF.
noSolutionDepVar	An Int specifying the number of solution-dependent variables. The default value is 0.
userSubUel	A String specifying the name of the user subroutine (*UEL*) that defines the user element.
dof	A String specifying the degrees of freedom, separated by commas.
solutionDepVars	A sequence of Floats specifying the initial values of the solution-dependent variables.

Optional arguments

None.

Return value

An ActuatorSensor object.

Exceptions

None.

`setValues(...)`

This method modifies the ActuatorSensor object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ActuatorSensor* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

Members

The ActuatorSensor object has members with the same names and descriptions as the arguments to the *ActuatorSensor* method.

ActuatorSensorProp object

The ActuatorSensorProp object is an interaction property that defines the properties referred to by an *ActuatorSensor* object.

The ActuatorSensorProp object is derived from the *InteractionProperty* object.

Access

```
import interaction
mdb.models[name].interactionProperties[name]
```

ActuatorSensorProp(...)

This method creates an ActuatorSensorProp object.

Path

```
mdb.models[name].ActuatorSensorProp
```

Required arguments

name A String specifying the interaction property repository key.

Optional arguments

realProperties A sequence of Floats specifying the `PROPS` array used by user subroutine *UEL*. The default value is an empty sequence.

integerProperties A sequence of Ints specifying the `JPROPS` array used by user subroutine *UEL*. The default value is an empty sequence.

Return value

An ActuatorSensorProp object.

Exceptions

None.

setValues(...)

This method modifies the ActuatorSensorProp object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ActuatorSensorProp* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The ActuatorSensorProp object has members with the same names and descriptions as the arguments to the *ActuatorSensorProp* method.

Corresponding analysis keywords

- **UEL PROPERTY*

ActuatorSensorState object

The ActuatorSensorState object stores the propagating data of an actuator sensor in a step. One instance of this object is created internally by the *ActuatorSensor* object for each step. The instance is also deleted internally by the *ActuatorSensor* object.

The ActuatorSensorState object has no constructor, methods, or members.

The ActuatorSensorState object is derived from the *InteractionState* object.

Access

```

```

Members

The ActuatorSensorState object has the following member:

status

A SymbolicConstant specifying the propagation state of the *InteractionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

CavityRadiation object

The CavityRadiation object defines cavities for thermal radiation heat transfer and controls the calculation of viewfactors.

The CavityRadiation object is derived from the *Interaction* object.

Access

```
import interaction
mdb.models[name].interactions[name]
```

CavityRadiation(...)

This method creates a CavityRadiation object.

Path

```
mdb.models[name].CavityRadiation
```

Required arguments

name
A String specifying the repository key.

createStepName
A String specifying the name of the step in which the cavity radiation interaction should be created.

surfaces
A *RegionArray* object specifying the surfaces for which radiation viewfactor control is being specified.

Optional arguments

surfaceEmissivities
A sequence of Strings specifying the names of the Cavity Radiation properties containing the surface emissivity data. One name per specified surface. The emissivity data is ignored when *surfaceReflection*=OFF.

ambientTemp
`None` or a Float specifying the reference ambient temperature value, θ^0. Specifying a value indicates an open cavity. The default value is `None`.

blocking
A SymbolicConstant specifying the blocking checks to be performed in the viewfactor calculations. Possible values are BLOCKING_ALL, NO_BLOCKING, and PARTIAL_BLOCKING. The default value is BLOCKING_ALL.

blockingSurfaces
A *RegionArray* object specifying the surfaces that provide blocking inside the cavity. This argument applies only when *blocking*=PARTIAL_BLOCKING.

rangeOfView
`None` or a Float specifying the maximum distance between surface facets at which viewfactors are calculated. More distant facets are deemed too far apart to exchange significant amounts of heat through radiation effects, and the viewfactors between these facets are assumed to be zero. If *rangeOfView*=`None`, there is no upper limit. The default value is `None`.

surfaceReflection

A Boolean specifying whether heat reflections are to be included in the cavity radiation calculations. The default value is ON.

viewfactorAccurTol

A Float specifying the acceptable tolerance for the viewfactor calculations. The default value is 0.05.

minInfinitesimalRatio

A Float specifying the facet area ratio above which the infinitesimal-to-finite area approximation is used for viewfactor calculations. The default value is 64.0.

numPointsPerEdge

An Int specifying the number of Gauss integration points to be used along each edge when the numerical integration of contour integrals is used for viewfactor calculations. One to five integration points are allowed. The default value is 3.

minLumpedAreaDS

A Float specifying the nondimensional distance-square value above which the lumped area approximation is used for viewfactor calculations. The default value is 5.0.

cyclicSymmetry

A Boolean specifying whether cyclic symmetry will be applied. This argument cannot be specified for axisymmetric models. The default value is OFF.

cyclicImages

An Int specifying the number of cyclically similar images that compose the cavity formed as a result of this symmetry. This argument applies only when *cyclicSymmetry*=ON. The default value is 2.

cyclicRotPt

A *ModelDot* object specifying the rotation axis point. This argument applies only when *cyclicSymmetry*=ON.

cyclicRotEndPt

A *ModelDot* object specifying the rotation axis end point. This argument applies only for three-dimensional models, and only when *cyclicSymmetry*=ON.

cyclicSymPt

A *ModelDot* object specifying the symmetry axis end point. This argument applies only when *cyclicSymmetry*=ON.

periodicSymmetries

An Int specifying the number of periodic symmetries that will be applied. The default value is 0.

periodicImages_1

An Int specifying the number of repetitions used in the numerical calculation of the cavity viewfactors resulting from the first periodic symmetry. The result of this symmetry is a cavity composed of the cavity surface defined in the model plus twice the value of *periodicImages_1*. This argument applies only when *periodicSymmetries* is greater than zero. The default value is 2.

periodicImages_2

An Int specifying the number of repetitions used in the numerical calculation of the cavity viewfactors resulting from the second periodic symmetry. The result of this symmetry is a cavity composed of the cavity surface defined in the model plus twice the value of *periodicImages_2*. This argument applies only when *periodicSymmetries* is greater than one. The default value is 2.

periodicImages_3

An Int specifying the number of repetitions used in the numerical calculation of the cavity viewfactors resulting from the third periodic symmetry. The result of this symmetry is a

cavity composed of the cavity surface defined in the model plus twice the value of *periodicImages_3*. This argument applies only when *periodicSymmetries* = 3. The default value is 2.

periodicSymAxis_1

A straight Edge, a *Datum* object representing a datum axis, or an ElementEdge object indicating the first line of symmetry in two-dimensional models. This argument applies only for 2D models, and when *periodicSymmetries* is greater than zero.

periodicSymAxis_2

A straight Edge, a *Datum* object representing a datum axis, or an ElementEdge object indicating the second line of symmetry in two-dimensional models. This argument applies only for two-dimensional models, and when *periodicSymmetries* = 2.

periodicSymPlane_1

A planar Face, an ElementFace, or a *Datum* object representing a datum plane; indicating the first plane of symmetry in three-dimensional models. This argument applies only for three-dimensional models, and when *periodicSymmetries* is greater than zero.

periodicSymPlane_2

A planar Face, an ElementFace, or a *Datum* object representing a datum plane; indicating the second plane of symmetry in three-dimensional models. This argument applies only for three-dimensional models, and when *periodicSymmetries* is greater than one.

periodicSymPlane_3

A planar Face, an ElementFace, or a *Datum* object representing a datum plane; indicating the third plane of symmetry in three-dimensional models. This argument applies only for three-dimensional models, and when *periodicSymmetries* = 3.

periodicDistance_1

A sequence of sequences of Floats specifying the two points of the vector that describes the periodic distance for the first periodic symmetry. Each point is defined by a tuple of three coordinates indicating its position. This argument applies only when *periodicSymmetries* is greater than zero. The default value is an empty sequence.

periodicDistance_2

A sequence of sequences of Floats specifying the two points of the vector that describes the periodic distance for the second periodic symmetry. Each point is defined by a tuple of three coordinates indicating its position. This argument applies only when *periodicSymmetries* is greater than one. The default value is an empty sequence.

periodicDistance_3

A sequence of sequences of Floats specifying the two points of the vector that describes the periodic distance for the third periodic symmetry. Each point is defined by a tuple of three coordinates indicating its position. This argument applies only when *periodicSymmetries* = 3. The default value is an empty sequence.

periodicSymZ

`None` or a Float specifying the Z value indicating the symmetry reference line in axisymmetric models. This argument applies only for axisymmetric models, and when *periodicSymmetries* = 1. The default value is `None`.

periodicDistZ

`None` or a Float specifying the Z value indicating the periodic distance in axisymmetric models. This argument applies only for axisymmetric models, and when *periodicSymmetries* = 1. The default value is `None`.

reflectionSymmetries

An Int specifying the number of reflection symmetries will be applied. The default value is 0.

reflectionSymAxis_1
A straight Edge, a *Datum* object representing a datum axis, or an ElementEdge object indicating the first line of symmetry in two-dimensional models. This argument applies only for two-dimensional models, and when *reflectionSymmetries* is greater than zero.

reflectionSymAxis_2
A straight Edge, a *Datum* object representing a datum axis, or an ElementEdge object indicating the second line of symmetry in two-dimensional models. This argument applies only for two-dimensional models, and when *reflectionSymmetries* = 2.

reflectionSymPlane_1
A planar Face, an ElementFace, or a *Datum* object representing a datum plane; indicating the first plane of symmetry in three-dimensional models. This argument applies only for three-dimensional models, and when *reflectionSymmetries* is greater than zero.

reflectionSymPlane_2
A planar Face, an ElementFace, or a *Datum* object representing a datum plane; indicating the second plane of symmetry in three-dimensional models. This argument applies only for three-dimensional models, and when *reflectionSymmetries* is greater than one.

reflectionSymPlane_3
A planar Face, an ElementFace, or a *Datum* object representing a datum plane; indicating the third plane of symmetry in three-dimensional models. This argument applies only for three-dimensional models, and when *reflectionSymmetries* = 3.

reflectionSymZ
`None` or a Float specifying the Z value indicating the symmetry reference line in axisymmetric models. This argument applies only for axisymmetric models, and when *reflectionSymmetries* = 1. The default value is `None`.

Return value

A CavityRadiation object.

Exceptions

None.

`setValues(...)`

This method modifies the data for an existing CavityRadiation object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *CavityRadiation* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data of an existing CavityRadiation object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the interaction is modified.

Optional arguments

blocking A SymbolicConstant specifying the blocking checks to be performed in the viewfactor calculations. Possible values are BLOCKING_ALL, NO_BLOCKING, and PARTIAL_BLOCKING. The default value is BLOCKING_ALL.

blockingSurfaces A *RegionArray* object specifying the surfaces that provide blocking inside the cavity. This argument applies only when *blocking*=PARTIAL_BLOCKING.

rangeOfView `None` or a Float specifying the maximum distance between surface facets at which viewfactors are calculated. More distant facets are deemed too far apart to exchange significant amounts of heat through radiation effects, and the viewfactors between these facets are assumed to be zero. If *rangeOfView*=`None`, there is no upper limit. The default value is `None`.

surfaceReflection A Boolean specifying whether heat reflections are to be included in the cavity radiation calculations. The default value is ON.

viewfactorAccurTol A Float specifying the acceptable tolerance for the viewfactor calculations. The default value is 0.05.

Return value

`None.`

Exceptions

None.

Members

The CavityRadiation object can have the following members:

name A String specifying the repository key.

ambientTemp `None` or a Float specifying the reference ambient temperature value, θ^0. Specifying a value indicates an open cavity. The default value is `None`.

minInfinitesimalRatio A Float specifying the facet area ratio above which the infinitesimal-to-finite area approximation is used for viewfactor calculations. The default value is 64.0.

numPointsPerEdge

An Int specifying the number of Gauss integration points to be used along each edge when the numerical integration of contour integrals is used for viewfactor calculations. One to five integration points are allowed. The default value is 3.

minLumpedAreaDS

A Float specifying the nondimensional distance-square value above which the lumped area approximation is used for viewfactor calculations. The default value is 5.0.

cyclicSymmetry

A Boolean specifying whether cyclic symmetry will be applied. This argument cannot be specified for axisymmetric models. The default value is OFF.

cyclicImages

An Int specifying the number of cyclically similar images that compose the cavity formed as a result of this symmetry. This argument applies only when *cyclicSymmetry*=ON. The default value is 2.

periodicSymmetries

An Int specifying the number of periodic symmetries that will be applied. The default value is 0.

periodicImages_1

An Int specifying the number of repetitions used in the numerical calculation of the cavity viewfactors resulting from the first periodic symmetry. The result of this symmetry is a cavity composed of the cavity surface defined in the model plus twice the value of *periodicImages_1*. This argument applies only when *periodicSymmetries* is greater than zero. The default value is 2.

periodicImages_2

An Int specifying the number of repetitions used in the numerical calculation of the cavity viewfactors resulting from the second periodic symmetry. The result of this symmetry is a cavity composed of the cavity surface defined in the model plus twice the value of *periodicImages_2*. This argument applies only when *periodicSymmetries* is greater than one. The default value is 2.

periodicImages_3

An Int specifying the number of repetitions used in the numerical calculation of the cavity viewfactors resulting from the third periodic symmetry. The result of this symmetry is a cavity composed of the cavity surface defined in the model plus twice the value of *periodicImages_3*. This argument applies only when *periodicSymmetries* = 3. The default value is 2.

periodicSymZ

`None` or a Float specifying the Z value indicating the symmetry reference line in axisymmetric models. This argument applies only for axisymmetric models, and when *periodicSymmetries* = 1. The default value is `None`.

periodicDistZ

`None` or a Float specifying the Z value indicating the periodic distance in axisymmetric models. This argument applies only for axisymmetric models, and when *periodicSymmetries* = 1. The default value is `None`.

reflectionSymmetries

An Int specifying the number of reflection symmetries will be applied. The default value is 0.

reflectionSymZ

`None` or a Float specifying the Z value indicating the symmetry reference line in axisymmetric models. This argument applies only for axisymmetric models, and when *reflectionSymmetries* = 1. The default value is `None`.

createStepName
A String specifying the name of the step in which the cavity radiation interaction should be created.

surfaces
A *RegionArray* object specifying the surfaces for which radiation viewfactor control is being specified.

surfaceEmissivities
A tuple of Strings specifying the names of the Cavity Radiation properties containing the surface emissivity data. One name per specified surface. The emissivity data is ignored when *surfaceReflection*=OFF.

cyclicRotPt
A *ModelDot* object specifying the rotation axis point. This argument applies only when *cyclicSymmetry*=ON.

cyclicRotEndPt
A *ModelDot* object specifying the rotation axis end point. This argument applies only for three-dimensional models, and only when *cyclicSymmetry*=ON.

cyclicSymPt
A *ModelDot* object specifying the symmetry axis end point. This argument applies only when *cyclicSymmetry*=ON.

periodicDistance_1
A tuple of tuples of Floats specifying the two points of the vector that describes the periodic distance for the first periodic symmetry. Each point is defined by a tuple of three coordinates indicating its position. This argument applies only when *periodicSymmetries* is greater than zero. The default value is an empty sequence.

periodicDistance_2
A tuple of tuples of Floats specifying the two points of the vector that describes the periodic distance for the second periodic symmetry. Each point is defined by a tuple of three coordinates indicating its position. This argument applies only when *periodicSymmetries* is greater than one. The default value is an empty sequence.

periodicDistance_3
A tuple of tuples of Floats specifying the two points of the vector that describes the periodic distance for the third periodic symmetry. Each point is defined by a tuple of three coordinates indicating its position. This argument applies only when *periodicSymmetries* = 3. The default value is an empty sequence.

CavityRadiationProp object

The CavityRadiationProp object is an interaction property that defines emissivity as a function of temperature and field variables.

The CavityRadiationProp object is derived from the *InteractionProperty* object.

Access

```
import interaction
mdb.models[name].interactionProperties[name]
```

CavityRadiationProp(...)

This method creates a CavityRadiationProp object.

Path

```
mdb.models[name].CavityRadiationProp
```

Required arguments

name A String specifying the interaction property repository key.

Optional arguments

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

property A sequence of sequences of Floats specifying the following:

- The emissivity, ϵ.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A CavityRadiationProp object.

Exceptions

None.

setValues(...)

This method modifies the CavityRadiationProp object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *CavityRadiationProp* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The CavityRadiationProp object has members with the same names and descriptions as the arguments to the *CavityRadiationProp* method.

- **EMISSIVITY*

CavityRadiationState object

The CavityRadiationState object stores the propagating data for a *CavityRadiation* object. One instance of this object is created internally by the *CavityRadiation* object for each step. The instance is also deleted internally by the *CavityRadiation* object.

The CavityRadiationState object has no constructor or methods.

The CavityRadiationState object is derived from the *InteractionState* object.

Access

```
import interaction
mdb.models[name].steps[name].interactionStates[name]
```

Members

The CavityRadiationState object has the following members:

blocking

A SymbolicConstant specifying the blocking checks to be performed in the viewfactor calculations. Possible values are BLOCKING_ALL, NO_BLOCKING, and PARTIAL_BLOCKING.

blockingState

A SymbolicConstant specifying the propagation state of the blocking member. Possible values are UNSET, SET, UNCHANGED, and FREED.

blockingSurfacesState

A SymbolicConstant specifying the propagation state of the *blockingSurfaces* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

rangeOfView

A Float specifying the distance beyond which factors need not be calculated because surfaces are judged to be too far apart to “see” each other (due to blocking by other surfaces).

rangeOfViewState

A SymbolicConstant specifying the propagation state of the *rangeOfView* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

surfaceReflection

A Boolean specifying whether reflection must be included in the cavity radiation calculations. The default value is ON.

surfaceReflectionState

A SymbolicConstant specifying the propagation state of the *surfaceReflection* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

viewfactorAccuracyTol

A Float specifying the acceptable tolerance for the viewfactor calculations.

viewfactorAccuracyTolState

A SymbolicConstant specifying the propagation state of the *viewfactorAccuracyTol* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

blockingSurfaces

A tuple of Strings specifying the surfaces that provide blocking inside the cavity.

status

A SymbolicConstant specifying the propagation state of the *InteractionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

CohesiveBehavior object

The CohesiveBehavior object specifies cohesive behavior for a contact interaction property.

Access

```
import interaction
mdb.models[name].interactionProperties[name].cohesiveBehavior
```

CohesiveBehavior(...)

This method creates a CohesiveBehavior object.

Path

```
mdb.models[name].interactionProperties[name].CohesiveBehavior
```

Required arguments

None.

Optional arguments

repeatedContacts A Boolean specifying whether to enforce cohesive behavior for recurrent contacts at nodes on the secondary surface subsequent to ultimate failure. The default value is OFF.

eligibility A SymbolicConstant specifying the eligible secondary nodes. Possible values are ALL_NODES, INITIAL_NODES, and SPECIFIED. The default value is ALL_NODES.

defaultPenalties A Boolean specifying whether to use the default contact penalties. The default value is ON.

coupling A SymbolicConstant specifying whether the traction-separation coefficients are coupled or uncoupled. This argument is valid only for *defaultPenalties*=OFF. Possible values are UNCOUPLED and COUPLED. The default value is UNCOUPLED.

temperatureDependency A Boolean specifying whether the coefficient data depend on temperature. This argument is valid only for *defaultPenalties*=OFF. The default value is OFF.

dependencies An Int specifying the number of field variables. This argument is valid only for *defaultPenalties*=OFF. The default value is 0.

table A sequence of sequences of Floats specifying the traction-separation coefficients. The items in the table data are described below. This argument is valid only for *defaultPenalties*=OFF.

Table data

If *coupling*=UNCOUPLED, the table data specify the following:

- Stiffness coefficient in the normal direction, K_{nn}.

- Stiffness coefficient in the first shear direction, K_{ss}.
- Stiffness coefficient in the second shear direction, K_{tt}.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *coupling*=COUPLED, the table data specify the following:

- Stiffness coefficient in the normal direction, K_{nn}.
- Stiffness coefficient in the first shear direction, K_{ss}.
- Stiffness coefficient in the second shear direction, K_{tt}.
- Coupled stiffness coefficient, K_{ns}.
- Coupled stiffness coefficient, K_{nt}.
- Coupled stiffness coefficient, K_{st}.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A CohesiveBehavior object.

Exceptions

None.

`setValues(...)`

This method modifies the CohesiveBehavior object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *CohesiveBehavior* method.

Return value

`None.`

Exceptions

None.

Members

The CohesiveBehavior object has members with the same names and descriptions as the arguments to the *CohesiveBehavior* method.

Corresponding analysis keywords

- **COHESIVE BEHAVIOR*

ConcentratedFilmCondition object

The ConcentratedFilmCondition object defines concentrated film coefficients and associated sink temperatures.

The ConcentratedFilmCondition object is derived from the *Interaction* object.

Access

```
import interaction
mdb.models[name].interactions[name]
```

ConcentratedFilmCondition(...)

This method creates a ConcentratedFilmCondition object.

Path

```
mdb.models[name].ConcentratedFilmCondition
```

Required arguments

name
A String specifying the repository key.

createStepName
A String specifying the name of the step in which the ConcentratedFilmCondition object is created.

region
A *Region* object specifying the region to which the concentrated film condition interaction is applied. The interaction is applied to each node in the region.

definition
A SymbolicConstant specifying how the concentrated film condition is defined. Possible values are EMBEDDED_COEFF, PROPERTY_REF, USER_SUB, and FIELD.

Optional arguments

nodalArea
A Float specifying the area associated with the node where the concentrated film condition is applied. The default value is 1.0.

explicitRegionType
A SymbolicConstant specifying how the concentrated film condition is applied to the boundary of an adaptive mesh domain. Possible values are LAGRANGIAN, SLIDING, and EULERIAN. The default value is LAGRANGIAN.

This argument applies only during an Abaqus/Explicit analysis.

interactionProperty
A String specifying the name of the *FilmConditionProp* object associated with this interaction. The *interactionProperty* argument applies only when *definition*=PROPERTY_REF. The default value is an empty string.

field
A String specifying the name of the *AnalyticalField* object associated with this interaction. The *field* argument applies only when *definition*=FIELD. The default value is an empty string.

sinkTemperature

A Float specifying the reference sink temperature, θ^0. The default value is 0.0.

sinkAmplitude

A String specifying the name of the *Amplitude* object that gives the variation of the sink temperature, θ^0, with time. The default value is an empty string.

Note:

Use `None` in an Abaqus/Standard analysis to specify that the reference sink temperature is applied immediately at the beginning of the step or linearly over the step. Use `None` in an Abaqus/Explicit analysis to specify that the reference sink temperature is applied throughout the step.

filmCoeff

A Float specifying the reference film coefficient value, h. The *filmCoeff* argument applies when *definition*=EMBEDDED_COEFF, *definition*=USER_SUB, or *definition*=FIELD. The default value is 0.0.

filmCoeffAmplitude

A String specifying the name of the *Amplitude* object that gives the variation of the film coefficient, h, with time. The default value is an empty string.

Note:

Use `None` in an Abaqus/Standard analysis to specify that the reference film coefficient is applied immediately at the beginning of the step or linearly over the step. Use `None` in an Abaqus/Explicit analysis to specify that the reference film coefficient is applied throughout the step.

sinkFieldName

A String specifying the name of the *AnalyticalField* or *DiscreteField* object associated with the sink temperature. The *sinkFieldName* argument applies only when *sinkDistributionType*=ANALYTICAL_FIELD or *sinkDistributionType*=DISCRETE_FIELD. The default value is an empty string.

sinkDistributionType

A SymbolicConstant specifying how the sink temperature is distributed. Possible values are UNIFORM, ANALYTICAL_FIELD, and DISCRETE_FIELD. The default value is UNIFORM.

Return value

A ConcentratedFilmCondition object.

Exceptions

None.

`setValues(...)`

This method modifies the data for an existing ConcentratedFilmCondition object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConcentratedFilmCondition* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data of an existing ConcentratedFilmCondition object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the interaction is modified.

Optional arguments

The optional arguments to `setValuesInStep` are the same as the optional arguments to the `ConcentratedFilmConditionState` method.

Return value

`None.`

Exceptions

None.

Members

The ConcentratedFilmCondition object has members with the same names and descriptions as the arguments to the *ConcentratedFilmCondition* method except the optional arguments to the *setValuesInStep* method.

ConcentratedFilmConditionState object

The ConcentratedFilmConditionState object stores the propagating data for a *ConcentratedFilmCondition* object. One instance of this object is created internally by the *ConcentratedFilmCondition* object for each step. The instance is also deleted internally by the *ConcentratedFilmCondition* object.

The ConcentratedFilmConditionState object has no constructor or methods.

The ConcentratedFilmConditionState object is derived from the *InteractionState* object.

Access

```
import interaction
mdb.models[name].steps[name].interactionStates[name]
```

Members

The ConcentratedFilmConditionState object has the following members:

interactionPropertyState
A SymbolicConstant specifying the propagation state of the *interactionProperty* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

sinkTemperature
A Float specifying the sink temperature.

sinkTemperatureState
A SymbolicConstant specifying the propagation state of the *sinkTemperature* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

sinkAmplitudeState
A SymbolicConstant specifying the propagation state of the *sinkAmplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

filmCoeff
A Float specifying the film coefficient.

filmCoeffState
A SymbolicConstant specifying the propagation state of the *filmCoeff* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

filmCoeffAmplitudeState
A SymbolicConstant specifying the propagation state of the *filmCoeffAmplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

nodalArea
A Float specifying the area associated with the node where the concentrated film condition is applied.

nodalAreaState
A SymbolicConstant specifying the propagation state of the *nodalArea* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

interactionProperty
A String specifying the *FilmConditionProp* object associated with this interaction.

sinkAmplitude
A String specifying the name of the Amplitude object that gives the variation of the sink temperature.

filmCoeffAmplitude

A String specifying the name of the Amplitude object that gives the variation of the film coefficient.

status

A SymbolicConstant specifying the propagation state of the *InteractionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

Corresponding analysis keywords

- **CFILM*

ConcentratedRadiationToAmbient object

The ConcentratedRadiationToAmbient object defines radiant heat transfer between a point and its nonreflecting environment.

The ConcentratedRadiationToAmbient object is derived from the *Interaction* object.

Access

```
import interaction
mdb.models[name].interactions[name]
```

ConcentratedRadiationToAmbient(...)

This method creates a ConcentratedRadiationToAmbient object.

Path

```
mdb.models[name].ConcentratedRadiationToAmbient
```

Required arguments

name
A String specifying the repository key.

createStepName
A String specifying the name of the step in which the ConcentratedRadiationToAmbient object is created.

region
A *Region* object specifying the region to which the concentrated radiation interaction is applied. The interaction is applied to each node in the region.

ambientTemperature
A Float specifying the reference ambient temperature, θ^0.

ambientTemperatureAmp
A String specifying the name of the *Amplitude* object that gives the variation of the ambient temperature with time.

Note:

Use `None` in an Abaqus/Standard analysis to specify that the reference ambient temperature is applied immediately at the beginning of the step or linearly over the step. Use `None` in an Abaqus/Explicit analysis to specify that the reference ambient temperature is applied throughout the step.

emissivity
A Float specifying the emissivity, ϵ.

Optional arguments

nodalArea
A Float specifying the area associated with the node where the concentrated radiation interaction is applied. The default value is 1.0.

explicitRegionType A SymbolicConstant specifying how the concentrated radiation is applied to the boundary of an adaptive mesh domain. Possible values are LAGRANGIAN, SLIDING, and EULERIAN. The default value is LAGRANGIAN.

Note:

explicitRegionType applies only during an Abaqus/Explicit analysis.

field A String specifying the name of the *AnalyticalField* object associated with this interaction. The *field* argument applies only when *distributionType*=ANALYTICAL_FIELD. The default value is an empty string.

distributionType A SymbolicConstant specifying how the radiation is defined. Possible values are UNIFORM and ANALYTICAL_FIELD. The default value is UNIFORM.

Return value

A ConcentratedRadiationToAmbient object.

Exceptions

None.

`setValues(...)`

This method modifies the data for an existing ConcentratedRadiationToAmbient object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConcentratedRadiationToAmbient* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data of an existing ConcentratedRadiationToAmbient object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the interaction is modified.

Optional arguments

The optional arguments to `setValuesInStep` are the same as the arguments to the *`ConcentratedRadiationToAmbient`* method, except for the *name*, *createStepName*, *region*, and *explicitRegionType* arguments.

Return value

`None.`

Exceptions

None.

Members

The ConcentratedRadiationToAmbient object has members with the same names and descriptions as the arguments to the *ConcentratedRadiationToAmbient* method.

ConcentratedRadiationToAmbientState object

The ConcentratedRadiationToAmbientState object stores the propagating data for a *ConcentratedRadiationToAmbient* object. One instance of this object is created internally by the *ConcentratedRadiationToAmbient* object for each step. The instance is also deleted internally by the *ConcentratedRadiationToAmbient* object.

The ConcentratedRadiationToAmbientState object has no constructor or methods.

The ConcentratedRadiationToAmbientState object is derived from the *InteractionState* object.

Access

```
import interaction
mdb.models[name].steps[name].interactionStates[name]
```

Members

The ConcentratedRadiationToAmbientState object has the following members:

ambientTemperature

A Float specifying the ambient temperature.

ambientTemperatureState

A SymbolicConstant specifying the propagation state of the *ambientTemperature* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

ambientTemperatureAmpState

A SymbolicConstant specifying the propagation state of the *ambientTemperatureAmp* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

emissivity

A Float specifying the emissivity.

emissivityState

A SymbolicConstant specifying the propagation state of the *emissivity* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

nodalArea

A Float specifying the area associated with the node where the concentrated radiation is applied.

nodalAreaState

A SymbolicConstant specifying the propagation state of the *nodalArea* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

ambientTemperatureAmp

A String specifying the name of the Amplitude object that gives the variation of the ambient temperature with time.

status

A SymbolicConstant specifying the propagation state of the *InteractionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED

ContactControl object

The ContactControl object is the abstract base type for other ContactControl objects. The ContactControl object has no explicit constructor, members, or methods.

Access

```
import interaction
mdb.models[name].contactControls[name]
```

Members

The ContactControl object has no members.

ContactDamage object

The ContactDamage object specifies damage options for a contact interaction property.

Access

```
import interaction
mdb.models[name].interactionProperties[name].damage
```

Damage(...)

This method creates a ContactDamage object.

Path

```
mdb.models[name].interactionProperties[name].Damage
```

Required arguments

initTable
A sequence of sequences of Floats specifying the values defining the damage initiation. The items in the table data are described below.

Optional arguments

criterion
A SymbolicConstant specifying the type of data used to define the initiation of damage. Possible values are MAX_STRESS, MAX_SEPARATION, QUAD_TRACTION, and QUAD_SEPARATION. The default value is MAX_STRESS.

initTempDep
A Boolean specifying whether the initiation data depend on temperature. The default value is OFF.

initDependencies
An Int specifying the number of initiation data field variables. The default value is 0.

useEvolution
A Boolean specifying whether evolution data will be defined. The default value is OFF.

evolutionType
A SymbolicConstant specifying the type of data used to define the evolution of damage. This argument is valid only when *useEvolution*=ON. Possible values are DISPLACEMENT and ENERGY. The default value is DISPLACEMENT.

softening
A SymbolicConstant specifying the type of data used to define the evolution softening response. This argument is valid only when *useEvolution*=ON. The TABULAR value can be used only when *evolutionType*=DISPLACEMENT. Possible values are LINEAR, EXPONENTIAL, and TABULAR. The default value is LINEAR.

useMixedMode
A Boolean specifying whether evolution data be defined using dependent behavior modes. This argument is valid only when *useEvolution*=ON. The default value is OFF.

mixedModeType
A SymbolicConstant specifying the mode mix fracture criterion. This argument is valid only when *useEvolution*=ON and when *useMixedMode*=ON. The POWER_LAW and BK values

can be used only when *evolutionType*=ENERGY. Possible values are TABULAR, POWER_LAW, and BK. The default value is TABULAR.

modeMixRatio

A SymbolicConstant specifying the mode mix ratio type. This argument is valid only when *useEvolution*=ON and when *useMixedMode*=ON. The TRACTION value can be used only when *mixedModeType*=TABULAR. Possible values are ENERGY and TRACTION. The default value is ENERGY.

exponent

`None` or a Float specifying the exponent in the power-law or BK criterion that defines the variation of fracture energy with mode mix. This argument is valid only when *useEvolution*=ON and when *mixedModeType*=POWER_LAW or BK. The default value is `None`.

evolTempDep

A Boolean specifying whether the evolution data depend on temperature. This argument is valid only when *useEvolution*=ON. The default value is OFF.

evolDependencies

An Int specifying the number of evolution data field variables. This argument is valid only when *useEvolution*=ON. The default value is 0.

evolTable

A sequence of sequences of Floats specifying the values defining the damage evolution. The items in the table data are described below. This argument is valid only when *useEvolution*=ON.

useStabilization

A Boolean specifying whether stabilization data will be defined. This argument is valid only when *useEvolution*=ON. The default value is OFF.

viscosityCoef

`None` or a Float specifying the viscosity coefficient. This argument is valid only when *useStabilization*=ON. The default value is `None`.

Table data

Table data for *initTable*:

If *criterion*=MAX_STRESS or QUAD_TRACTION, the table data specify the following:

- Maximum nominal stress in the normal-only mode.
- Maximum nominal stress in the first shear direction (for a mode that involves separation only in this direction).
- Maximum nominal stress in the second shear direction (for a mode that involves separation only in this direction).
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *criterion*=MAX_SEPARATION or QUAD_SEPARATION, the table data specify the following:

- Separation at damage initiation in a normal-only mode.
- Separation at damage initiation in a shear-only mode that involves separation only along the first shear direction.
- Separation at damage initiation in a shear-only mode that involves separation only along the second shear direction.
- Temperature, if the data depend on temperature.

- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Table data for *evolTable*:

If *evolutionType*=DISPLACEMENT, *softening*=LINEAR, and *useMixedMode*=OFF, the table data specify the following:

- Effective total or plastic displacement at failure, measured from the time of damage initiation.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *evolutionType*=ENERGY, *softening*=LINEAR or EXPONENTIAL, and *useMixedMode*=OFF, the table data specify the following:

- Fracture energy.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *evolutionType*=DISPLACEMENT, *softening*=LINEAR, *useMixedMode*=ON, *mixedModeType*=TABULAR, and *modeMixRatio*=ENERGY or TRACTION, the table data specify the following:

- Total displacement at failure, measured from the time of damage initiation.
- Appropriate mode mix ratio.
- Appropriate mode mix ratio (if relevant, for three dimensional problems with anisotropic shear behavior).
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *evolutionType*=ENERGY, *softening*=LINEAR or EXPONENTIAL, *useMixedMode*=ON, *mixedModeType*=TABULAR, and *modeMixRatio*=ENERGY or TRACTION, the table data specify the following:

- Fracture energy.
- Appropriate mode mix ratio.
- Appropriate mode mix ratio (if relevant, for three dimensional problems with anisotropic shear behavior).
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *evolutionType*=DISPLACEMENT, *softening*=EXPONENTIAL, and *useMixedMode*=OFF, the table data specify the following:

- Effective total or plastic displacement at failure, measured from the time of damage initiation.

- Exponential law parameter.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *evolutionType*=DISPLACEMENT, *softening*=EXPONENTIAL, *useMixedMode*=ON, *mixedModeType*=TABULAR, and *modeMixRatio*=ENERGY or TRACTION, the table data specify the following:

- Total displacement at failure, measured from the time of damage initiation.
- Exponential law parameter.
- Appropriate mode mix ratio.
- Appropriate mode mix ratio (if relevant, for three dimensional problems with anisotropic shear behavior).
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *evolutionType*=DISPLACEMENT, *softening*=TABULAR, and *useMixedMode*=OFF, the table data specify the following:

- Damage variable.
- Effective total or plastic displacement at failure, measured from the time of damage initiation.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *evolutionType*=DISPLACEMENT, *softening*=TABULAR, *useMixedMode*=ON, *mixedModeType*=TABULAR, and *modeMixRatio*=ENERGY or TRACTION, the table data specify the following:

- Damage variable.
- Effective total displacement, measured from the time of damage initiation.
- Appropriate mode mix ratio.
- Appropriate mode mix ratio (if relevant, for three dimensional problems with anisotropic shear behavior).
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *evolutionType*=ENERGY, *softening*=LINEAR or EXPONENTIAL, *useMixedMode*=ON, *mixedModeType*=POWER_LAW or BK, and *modeMixRatio*=ENERGY, the table data specify the following:

- Normal mode fracture energy.
- Shear mode fracture energy for failure in the first shear direction.
- Shear mode fracture energy for failure in the second shear direction.

- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A ContactDamage object.

Exceptions

None.

`setValues(...)`

This method modifies the ContactDamage object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ContactDamage* method.

Return value

`None.`

Exceptions

None.

Members

The ContactDamage object has the following members:

criterion
A SymbolicConstant specifying the type of data used to define the initiation of damage. Possible values are MAX_STRESS, MAX_SEPARATION, QUAD_TRACTION, and QUAD_SEPARATION. The default value is MAX_STRESS.

initTempDep
A Boolean specifying whether the initiation data depend on temperature. The default value is OFF.

initDependencies
An Int specifying the number of initiation data field variables. The default value is 0.

useEvolution
A Boolean specifying whether evolution data will be defined. The default value is OFF.

evolutionType
A SymbolicConstant specifying the type of data used to define the evolution of damage. This argument is valid only when *useEvolution*=ON. Possible values are DISPLACEMENT and ENERGY. The default value is DISPLACEMENT.

softening
A SymbolicConstant specifying the type of data used to define the evolution softening response. This argument is valid only when *useEvolution*=ON. The TABULAR value can be used only when *evolutionType*=DISPLACEMENT. Possible values are LINEAR, EXPONENTIAL, and TABULAR. The default value is LINEAR.

useMixedMode
A Boolean specifying whether evolution data be defined using dependent behavior modes. This argument is valid only when *useEvolution*=ON. The default value is OFF.

mixedModeType
A SymbolicConstant specifying the mode mix fracture criterion. This argument is valid only when *useEvolution*=ON and when *useMixedMode*=ON. The POWER_LAW and BK values can be used only when *evolutionType*=ENERGY. Possible values are TABULAR, POWER_LAW, and BK. The default value is TABULAR.

modeMixRatio
A SymbolicConstant specifying the mode mix ratio type. This argument is valid only when *useEvolution*=ON and when *useMixedMode*=ON. The TRACTION value can be used only when *mixedModeType*=TABULAR. Possible values are ENERGY and TRACTION. The default value is ENERGY.

exponent
`None` or a Float specifying the exponent in the power-law or BK criterion that defines the variation of fracture energy with mode mix. This argument is valid only when *useEvolution*=ON and when *mixedModeType*=POWER_LAW or BK. The default value is `None`.

evolTempDep
A Boolean specifying whether the evolution data depend on temperature. This argument is valid only when *useEvolution*=ON. The default value is OFF.

evolDependencies
An Int specifying the number of evolution data field variables. This argument is valid only when *useEvolution*=ON. The default value is 0.

useStabilization
A Boolean specifying whether stabilization data will be defined. This argument is valid only when *useEvolution*=ON. The default value is OFF.

viscosityCoef
`None` or a Float specifying the viscosity coefficient. This argument is valid only when *useStabilization*=ON. The default value is `None`.

initTable
A tuple of tuples of Floats specifying the values defining the damage initiation. The items in the table data are described below.

evolTable
A tuple of tuples of Floats specifying the values defining the damage evolution. The items in the table data are described below. This argument is valid only when *useEvolution*=ON.

ContactDamping object

The ContactDamping object specifies damping for a contact interaction property.

Access

```
import interaction
mdb.models[name].interactionProperties[name].damping
```

Damping(...)

This method creates a ContactDamping object.

Path

```
mdb.models[name].interactionProperties[name].Damping
```

Required arguments

None.

Optional arguments

definition

A SymbolicConstant specifying the method used to define the damping. Possible values are DAMPING_COEFFICIENT and CRITICAL_DAMPING_FRACTION. The default value is DAMPING_COEFFICIENT.

tangentFraction

The SymbolicConstant DEFAULT or a Float specifying the tangential damping coefficient divided by the normal damping coefficient. The default value is DEFAULT.

clearanceDependence

A SymbolicConstant specifying the variation of the damping coefficient or fraction with respect to clearance. Possible values are STEP, LINEAR, and BILINEAR. The default value is STEP.

If *definition*=CRITICAL_DAMPING_FRACTION, the only possible value is STEP.

table

A sequence of pairs of Floats specifying the damping properties. The items in the table data are described below.

Table data

If *definition*=DAMPING_COEFFICIENT and *clearanceDependence*=STEP, the table data specify the following:

- Damping coefficient.

If *definition*=DAMPING_COEFFICIENT and *clearanceDependence*=LINEAR or BILINEAR, the table data specify the following:

- Damping coefficient.
- Clearance.

Two pairs must be given for *clearanceDependence*=LINEAR and three pairs for *clearanceDependence*=BILINEAR. The first pair must have *clearance*=0.0, and the last pair must have *coefficient*=0.0.

If *definition*=CRITICAL_DAMPING_FRACTION, the table data specify the following:

- Critical damping fraction.

Return value

A ContactDamping object.

Exceptions

None.

setValues(...)

This method modifies the ContactDamping object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ContactDamping* method.

Return value

`None.`

Exceptions

None.

Members

The ContactDamping object has the following members:

definition

A SymbolicConstant specifying the method used to define the damping. Possible values are DAMPING_COEFFICIENT and CRITICAL_DAMPING_FRACTION. The default value is DAMPING_COEFFICIENT.

mdb.models[name].ContactExp
```

Required arguments

name A String specifying the repository key.

createStepName A String specifying the name of the step in which this contact interaction is created.

Optional arguments

useAllstar A Boolean specifying whether the contacting surface pair consists of all exterior faces, shell edges, beam segments, analytical rigid surfaces, and, when applicable, Eulerian material surfaces.

globalSmoothing A Boolean specifying whether surface smoothing (geometric correction) is automatically applied to all eligible surfaces. The default value is ON.

includedPairs A *RegionPairs* object specifying the domain pairs included in contact.

excludedPairs A *RegionPairs* object specifying the domain pairs excluded from contact.

contactPropertyAssignments A *ContactPropertyAssignment* object specifying the contact property assignments in the contact domain.

surfaceThicknessAssignments A *SurfaceThicknessAssignment* object specifying the surface thickness assignments in the contact domain.

surfaceOffsetAssignments A *SurfaceOffsetAssignment* object specifying the surface offset fraction assignments in the contact domain.

surfaceFeatureAssignments A *SurfaceFeatureAssignment* object specifying the surface feature angle assignments in the contact domain.

smoothingAssignments A *SmoothingAssignment* object specifying the surface smoothing assignments in the contact domain.

surfaceCrushTriggerAssignments A *SurfaceCrushTriggerAssignment* object specifying the surface crush trigger assignments in the contact domain.

surfaceFrictionAssignments A *SurfaceFrictionAssignment* object specifying the surface friction assignments in the contact domain.

mainSecondaryAssignments A *MainSecondaryAssignment* object specifying the main-secondary assignments in the contact domain.

PolarityAssignments A *PolarityAssignments* object specifying the polarity assignments in the contact domain.

Return value

A ContactExp object.

Exceptions

None.

ContactExp(...)

This method creates a ContactExp object.

Path

```
mdb.models[name].ContactExp
```

Required arguments

name A String specifying the repository key.

createStepName A String specifying the name of the step in which this contact interaction is created.

Optional arguments

globalSmoothing A Boolean specifying whether surface smoothing (geometric correction) is automatically applied to all eligible surfaces. The default value is ON.

surfaceCrushTriggerAssignments A sequence of tuples specifying the surface crush trigger assignments. Each tuple contains four entries:

- A region or a material object or the SymbolicConstant GLOBAL specifying the surface to which the feature angle is assigned.
- A SymbolicConstant specifying the trigger option to be used for the surface. Possible values of the SymbolicConstant are TRIGGER, NO_TRIGGER, or NO_CRUSH.

- A Float specifying the crush stress value to be used for the surface.
- A Float specifying the crush initiation angle value to be used for the surface.
- A Float specifying the crush continuation angle value to be used for the surface.

surfaceFrictionAssignments

A sequence of tuples specifying the surface friction assignments. Each tuple contains two entries:

- A region or a material object or the SymbolicConstant GLOBAL specifying the surface to which the friction coefficient is assigned.
- A Float specifying the overriding friction coefficient to be used in the contact definition.

useAllstar

A Boolean specifying whether the contacting surface pair consists of all exterior faces, shell edges, beam segments, analytical rigid surfaces, and, when applicable, Eulerian material surfaces.

includedPairs

A sequence of pairs of *Region* objects or SymbolicConstants that specifies the surface pairs in contact. Possible values of the SymbolicConstants are ALLSTAR and SELF. This argument is valid only when *useAllstar*=OFF.

excludedPairs

A sequence of pairs of *Region* objects or SymbolicConstants that specify the surface pairs excluded from contact. Possible values of the SymbolicConstants are ALLSTAR and SELF.

contactPropertyAssignments

A sequence of tuples specifying the properties assigned to each surface pair. Each tuple contains three entries:

- A *Region* object or the SymbolicConstant GLOBAL.
- A *Region* object or the SymbolicConstant SELF.
- A String specifying an *InteractionProperty* object associated with this pair of regions.

surfaceThicknessAssignments

A sequence of tuples specifying the surface thickness assignments in the contact domain. Each tuple contains three entries:

- A region object or the SymbolicConstant GLOBAL specifying the surface to which the surface thickness is assigned.
- A Float or a SymbolicConstant specifying the overriding thickness value to be used in the contact definition. Possible values of the SymbolicConstant are ORIGINAL or THINNING.
- A Float specifying a scale factor that multiplies the thickness value specified in the second entry.

surfaceOffsetAssignments

A sequence of tuples specifying the surface offset fraction assignments in the contact domain. Each tuple contains two entries:

- A region object or the SymbolicConstant GLOBAL specifying the surface to which the surface offset fraction is assigned.

- A Float or a SymbolicConstant specifying the offset fraction value to be used in the contact definition. Possible values of the SymbolicConstant are ORIGINAL, SPOS, or SNEG.

surfaceFeatureAssignments

A sequence of tuples specifying the surface feature angle assignments in the contact domain. Each tuple contains two entries:

- A region object or the SymbolicConstant GLOBAL specifying the surface to which the surface feature angle is assigned.
- A Float or a SymbolicConstant specifying the overriding feature angle value to be used in the contact definition. Possible values of the SymbolicConstant are PERIMETER, ALL, PICKED, or NONE.

smoothingAssignments

A sequence of tuples specifying the surface smoothing assignments in the contact domain. Each tuple contains two entries:

- A region object specifying the surface to which the smoothing option is assigned.
- A SymbolicConstant specifying the smoothing option to be used in the contact definition. Possible values of the SymbolicConstant are NONE, REVOLUTION, SPHERICAL, or TOROIDAL.

mainSecondaryAssignments

A sequence of tuples specifying pure main-secondary assignments in the contact domain. Each tuple contains three entries:

- A region object or the SymbolicConstant GLOBAL specifying the first surface that defines the main-secondary assignment.
- A region object specifying the second surface in the main-secondary assignment definition.
- A SymbolicConstant specifying the status of the first surface. Possible values are MAIN and SECONDARY.

polarityAssignments

A sequence of tuples specifying polarity assignments in the contact domain. Each tuple contains three entries:

- A region object or the SymbolicConstant GLOBAL specifying the first surface that defines the polarity assignment.
- A region object specifying the second surface in the polarity assignment definition.
- A SymbolicConstant specifying the polarity of the second surface. Possible values are SPOS, SNEG, and TWO_SIDED.

Return value

A ContactExp object.

Exceptions

None.

Members

The ContactExp object can have the following members:

name
A String specifying the repository key.

globalSmoothing
A Boolean specifying whether surface smoothing (geometric correction) is automatically applied to all eligible surfaces. The default value is ON.

includedPairs
A *RegionPairs* object specifying the domain pairs included in contact.

excludedPairs
A *RegionPairs* object specifying the domain pairs excluded from contact.

contactPropertyAssignments
A *ContactPropertyAssignment* object specifying the contact property assignments in the contact domain.

surfaceThicknessAssignments
A *SurfaceThicknessAssignment* object specifying the surface thickness assignments in the contact domain.

surfaceOffsetAssignments
A *SurfaceOffsetAssignment* object specifying the surface offset fraction assignments in the contact domain.

surfaceFeatureAssignments
A *SurfaceFeatureAssignment* object specifying the surface feature angle assignments in the contact domain.

smoothingAssignments
A *SmoothingAssignment* object specifying the surface smoothing assignments in the contact domain.

mainSecondaryAssignments
A *MainSecondaryAssignment* object specifying the main-secondary assignments in the contact domain.

polarityAssignments
A *PolarityAssignment* object specifying the polarity assignments in the contact domain.

assignBeamCrossSection
A Boolean specifying whether to assign the beam cross section. The default value is False.

beamCrossSection
A SymbolicConstant specifying whether the contact calculations should be based on a circumferential approximation or the actual cross section of the beam element. Possible values are CIRCUMSCRIBED_CIRCLE and EXACT.

ContactInitialization object

The ContactInitialization object is the abstract base type for other ContactInitialization objects. The ContactInitialization object has no explicit constructor, members, or methods.

Access

```
import interaction
mdb.models[name].contactInitializations[name]
```

Members

The ContactInitialization object has no members.

ContactMassScalingExp object

The ContactMassScalingExp object defines contact mass scaling during an Abaqus/Explicit analysis.

The ContactMassScalingExp object is derived from the *Interaction* object.

Access

```
import interaction
mdb.models[name].interactions[name]
```

ContactMassScalingExp(...)

This method creates a ContactMassScalingExp object.

Path

```
mdb.models[name].ContactMassScalingExp
```

Required arguments

name	A String specifying the repository key.
createStepName	A String specifying the name of the step in which the ContactMassScalingExp object is created.
location	A SymbolicConstant specifying the location. Possible values are ELEMENT MASS SCALING (default), NONE, ALL CONTACT SURFACES, and SPECIFIED SURFACES.
surfaces	A tuple of *Region* objects specifying the surfaces when *LOCATION*=SPECIFIED SURFACES.

Return value

A ContactMassScalingExp object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing ContactMassScalingExp object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ContactMassScalingExp* method, except for the *name* and *createStepName* arguments.

Return value
`None.`

Exceptions
None.

`setValuesInStep(...)`

This method modifies the propagating data of an existing ContactMassScalingExp object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the interaction is modified.

Optional arguments
The optional arguments to `setValuesInStep` are the same as the arguments to the *ContactMassScalingExp* method, except for the *name* and *createStepName* arguments.

Return value
`None.`

Exceptions
None.

ContactProperty object

The ContactProperty object defines a contact interaction property.

The ContactProperty object is derived from the *InteractionProperty* object.

Access

```
import interaction
mdb.models[name].interactionProperties[name]
```

ContactProperty(...)

This method creates a ContactProperty object.

Path

```
mdb.models[name].ContactProperty
```

Required arguments

name A String specifying the interaction property repository key.

Optional arguments

None.

Return value

A ContactProperty object.

Exceptions

None.

Members

The ContactProperty object can have the following members:

tangentialBehavior A *ContactTangentialBehavior* object.

normalBehavior A *NormalBehavior* object.

damping A *ContactDamping* object.

damage A *ContactDamage* object.

fractureCriterion A *FractureCriterion* object.

cohesiveBehavior A *CohesiveBehavior* object.

thermalConductance	A *ThermalConductance* object.
heatGeneration	A *GapHeatGeneration* object.
radiation	A *Radiation* object.
geometricProperties	A *GeometricProperties* object.
electricalConductance	A *GapElectricalConductance* object.
gapDiffusivity	A *GapDiffusivity* object.

Corresponding analysis keywords

- **SURFACE INTERACTION*

ContactPropertyAssignment object

The ContactPropertyAssignment object stores the contact property assignment definition for domain pairs in *ContactExp* and *ContactStd* objects. The ContactPropertyAssignment object has no constructor or members.

Access

```
import interaction
mdb.models[name].interactions[name].contactPropertyAssignments
```

changeValuesInStep(...)

This method allows modification of contact property assignments to domain pairs already defined in a given step.

Required arguments

stepName A String specifying the name of the step in which the contact property assignments are to be modified.

index An Int specifying the position of the contact property assignment whose value is to be modified.

value A String specifying the value of the contact property to be assigned to the domain pair whose index is referenced.

Optional arguments

None.

Return value

None.

Exceptions

None.

appendInStep(...)

This method allows addition of contact property assignments to new domain pairs in a given step.

Required arguments

stepName A String specifying the name of the step in which new contact property assignments are to be defined.

assignments A sequence of tuples specifying the properties assigned to each surface pair. Each tuple contains three entries:

- A region or a material object or the SymbolicConstant GLOBAL.

- A region or a material object or the SymbolicConstant SELF. When used with a *ContactExp* object, this parameter can also be a string that references an Eulerian material surface.
- A String specifying a *ContactProperty* object associated with this pair of regions.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`delete(...)`

The `delete` method allows you to delete existing contact property assignments.

Required arguments

indices

A sequence of Ints specifying the index of each contact property assignment to delete. The *indices* and *surfPair* arguments are mutually exclusive.

surfPair

A sequence of tuples specifying the surface pair of each contact property assignment to delete. Each tuple contains two entries:

- A region or a material object or the SymbolicConstant GLOBAL.
- A region or a material object or the SymbolicConstant SELF. When used with a *ContactExp* object, this parameter can also be a string that references an Eulerian material surface.

surfPair and *indices* arguments are mutually exclusive.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

Members

The ContactPropertyAssignment object has no members.

Corresponding analysis keywords

- **CONTACT PROPERTY ASSIGNMENT*

ContactStabilization object

The ContactStabilization object is the abstract base type for other ContactStabilization objects. The ContactStabilization object has no explicit constructor, members, or methods.

Access

```
import interaction
mdb.models[name].contactStabilizations[name]
```

Members

The ContactStabilization object has no members.

ContactStd object

The ContactStd object defines the contact domain and associated properties during contact in an Abaqus/Standard analysis.

The ContactStd object is derived from the *Interaction* object.

Access

```
import interaction
mdb.models[name].interactions[name]
```

ContactStd(...)

This method creates a ContactStd object.

Path

```
mdb.models[name].ContactStd
```

Required arguments

name
A String specifying the repository key.

createStepName
A String specifying the name of the step in which this contact interaction is created.

Optional arguments

useAllstar
A Boolean specifying whether the contacting surface pairs consist of all exterior faces in the model.

globalSmoothing
A Boolean specifying whether surface smoothing (geometric correction) is automatically applied to all eligible surfaces. The default value is ON.

includedPairs
A *RegionPairs* object specifying the domain pairs included in contact.

excludedPairs
A *RegionPairs* object specifying the domain pairs excluded from contact.

contactPropertyAssignments
A *ContactPropertyAssignment* object specifying the contact property assignments in the contact domain.

surfaceThicknessAssignments
A *SurfaceThicknessAssignment* object specifying the surface thickness assignments in the contact domain.

surfaceOffsetAssignments
A *SurfaceOffsetAssignment* object specifying the surface offset fraction assignments in the contact domain.

surfaceFeatureAssignments
A *SurfaceFeatureAssignment* object specifying the surface feature angle assignments in the contact domain.

surfaceBeamSmoothingAssignments A *SurfaceBeamSmoothingAssignment* object specifying the surface beam smoothing assignments in the contact domain.

surfaceVertexCriteriaAssignments A *SurfaceVertexCriteriaAssignment* object specifying the surface vertex criteria assignments in the contact domain.

mainSecondaryAssignments A *MainSecondaryAssignment* object specifying the main-secondary assignments in the contact domain.

initializationAssignments An *InitializationAssignment* object specifying the contact initialization assignments in the contact domain.

stabilizationAssignments A *StabilizationAssignment* object specifying the contact stabilization assignments in the contact domain.

smoothingAssignments A *SmoothingAssignment* object specifying the surface smoothing assignments in the contact domain.

slidingTransitionAssignments A *SlidingTransitionAssignment* object specifying the sliding transition assignments in the contact domain.

slidingFormulationAssignments A *SlidingFormulationAssignment* object specifying the sliding formulation assignments in the contact domain.

Return value

A ContactStd object.

Exceptions

None.

ContactStd(...)

This method creates a ContactStd object.

Path

```
mdb.models[name].ContactStd
```

Required arguments

name A String specifying the repository key.

createStepName A String specifying the name of the step in which this contact interaction is created.

Optional arguments

globalSmoothing

A Boolean specifying whether surface smoothing (geometric correction) is automatically applied to all eligible surfaces. The default value is ON.

surfaceBeamSmoothingAssignments

A sequence of tuples specifying the surface beam smoothing assignments. Each tuple contains two entries:

- A region object specifying the surface to which the smoothing is assigned.
- A Float specifying the surface smoothing value to be used for the surface.

surfaceVertexCriteriaAssignments

A sequence of tuples specifying the surface vertex criteria assignments. Each tuple contains two entries:

- A region or a material object or the SymbolicConstant GLOBAL specifying the surface to which the vertex criteria is assigned.
- A Float or a SymbolicConstant specifying the vertex criteria value to be used for the surface. Possible values of the SymbolicConstant are ALL_VERTICES or NO_VERTICES.

slidingFormulationAssignments

A sequence of tuples specifying the sliding formulation assignments. Each tuple contains two entries:

- A region object or the SymbolicConstant GLOBAL specifying the surface to which the sliding formulation attribute is assigned.
- A SymbolicConstant specifying the overriding the smoothness value to be used for the first surface. Possible values of the SymbolicConstant are NONE and SMALL_SLIDING.

useAllstar

A Boolean specifying whether the contacting surface pairs consist of all exterior faces in the model.

includedPairs

A sequence of pairs of *Region* objects or SymbolicConstants that specifies the surface pairs in contact. Possible values of the SymbolicConstants are ALLSTAR and SELF. This argument is valid only when *useAllstar*=OFF.

excludedPairs

A sequence of pairs of *Region* objects or SymbolicConstants that specifies the surface pairs excluded from contact. Possible values of the SymbolicConstants are ALLSTAR and SELF.

contactPropertyAssignments

A sequence of tuples specifying the properties assigned to each surface pair. Each tuple contains three entries:

- A *Region* object or the SymbolicConstant GLOBAL.
- A *Region* object or the SymbolicConstant SELF.
- A String specifying an *InteractionProperty* object associated with this pair of regions.

surfaceFeatureAssignments

A sequence of tuples specifying the surface feature angle assignments in the contact domain. Each tuple contains two entries:

- A region object or the SymbolicConstant GLOBAL specifying the surface to which the surface feature angle is assigned.
- A Float or a SymbolicConstant specifying the overriding feature angle value to be used in the contact definition. Possible values of the SymbolicConstant are PERIMETER or NONE.

surfaceThicknessAssignments

A sequence of tuples specifying the surface thickness assignments in the contact domain. Each tuple contains three entries:

- A region object or the SymbolicConstant GLOBAL specifying the surface to which the surface thickness is assigned.
- A Float or a SymbolicConstant specifying the overriding thickness value to be used in the contact definition. The SymbolicConstant ORIGINAL may be specified instead of a floating point value.
- A Float specifying a scale factor that multiplies the thickness value specified in the second entry.

surfaceOffsetAssignments

A sequence of tuples specifying the surface offset fraction assignments in the contact domain. Each tuple contains two entries:

- A region object or the SymbolicConstant GLOBAL specifying the surface to which the surface offset fraction is assigned.
- A Float or a SymbolicConstant specifying the offset fraction value to be used in the contact definition. Possible values of the SymbolicConstant are ORIGINAL, SPOS, or SNEG.

mainSecondaryAssignments

A sequence of tuples specifying main-secondary assignments in the contact domain. Each tuple contains three entries:

- A region object or the SymbolicConstant GLOBAL specifying the first surface that defines the main-secondary assignment.
- A region object specifying the second surface in the main-secondary assignment definition.
- A SymbolicConstant specifying the status of the first surface. Possible values are MAIN, SECONDARY, and BALANCED.

initializationAssignments

A sequence of tuples specifying the contact initialization data assigned to each surface pair. Each tuple contains three entries:

- A *Region* object or the SymbolicConstant GLOBAL.
- A *Region* object or the SymbolicConstant SELF.
- A String specifying a *StdInitialization* object associated with this pair of regions.

stabilizationAssignments

A sequence of tuples specifying the contact stabilization assigned to each surface pair. Each tuple contains three entries:

- A *Region* object or the SymbolicConstant GLOBAL.

- A *Region* object or the SymbolicConstant SELF.
- A String specifying a *StdStabilization* object associated with this pair of regions.

smoothingAssignments

A sequence of tuples specifying the surface smoothing assignments in the contact domain. Each tuple contains two entries:

- A region object specifying the surface to which the smoothing option is assigned.
- A SymbolicConstant specifying the smoothing option to be used in the contact definition. Possible values of the SymbolicConstant are NONE, REVOLUTION, SPHERICAL, or TOROIDAL.

slidingTransitionAssignments

A sequence of tuples specifying sliding transition assignments in the contact domain. Each tuple contains three entries:

- A region object or the SymbolicConstant GLOBAL specifying the first surface that defines the sliding transition assignment.
- A region object specifying the second surface in the sliding transition assignment definition.
- A SymbolicConstant specifying the smoothness value. Possible values are ELEMENT_ORDER_SMOOTHING, LINEAR_SMOOTHING, and QUADRATIC_SMOOTHING.

Return value

A ContactStd object.

Exceptions

None.

Members

The ContactStd object can have the following members:

name

A String specifying the repository key.

globalSmoothing

A Boolean specifying whether surface smoothing (geometric correction) is automatically applied to all eligible surfaces. The default value is ON.

includedPairs

A *RegionPairs* object specifying the domain pairs included in contact.

excludedPairs

A *RegionPairs* object specifying the domain pairs excluded from contact.

contactPropertyAssignments

A *ContactPropertyAssignment* object specifying the contact property assignments in the contact domain.

surfaceThicknessAssignments

A *SurfaceThicknessAssignment* object specifying the surface thickness assignments in the contact domain.

surfaceOffsetAssignments

A *SurfaceOffsetAssignment* object specifying the surface offset fraction assignments in the contact domain.

mainSecondaryAssignments

A *MainSecondaryAssignment* object specifying the main-secondary assignments in the contact domain.

initializationAssignments

An *InitializationAssignment* object specifying the contact initialization assignments in the contact domain.

stabilizationAssignments

A *StabilizationAssignment* object specifying the contact stabilization assignments in the contact domain.

smoothingAssignments

A *SmoothingAssignment* object specifying the surface smoothing assignments in the contact domain.

surfaceFeatureAssignments

A *SurfaceFeatureAssignment* object specifying the surface feature angle assignments in the contact domain.

slidingTransitionAssignments

A *SlidingTransitionAssignment* object specifying the sliding transition assignments in the contact domain.

assignBeamCrossSection

A Boolean specifying whether to assign the beam cross section. The default value is False.

beamCrossSection

A SymbolicConstant specifying whether the contact calculations should be based on a circumferential approximation or the actual cross section of the beam element. Possible values are CIRCUMSCRIBED_CIRCLE and EXACT.

assignEdgeToEdgeformulation

A Boolean specifying whether to assign the edge-to-edge formulation. The default value is False.

edgeToEdgeFormulation

A symbolic constant specifying edge-to-edge formulation. The default value is NO.

Corresponding analysis keywords

- **CONTACT*

ContactTangentialBehavior object

The ContactTangentialBehavior object specifies tangential behavior for a contact interaction property.

Access

```
import interaction
mdb.models[name].interactionProperties[name].tangentialBehavior
```

TangentialBehavior(...)

This method creates a ContactTangentialBehavior object.

Path

```
mdb.models[name].interactionProperties[name].TangentialBehavior
```

Required arguments

None.

Optional arguments

formulation

A SymbolicConstant specifying the friction formulation. Possible values are FRICTIONLESS, PENALTY, EXPONENTIAL_DECAY, ROUGH, LAGRANGE, and USER_DEFINED. The default value is FRICTIONLESS.

directionality

A SymbolicConstant specifying the directionality of the friction. Possible values are ISOTROPIC and ANISOTROPIC. The default value is ISOTROPIC.

slipRateDependency

A Boolean specifying whether the data depend on slip rate. The default value is OFF.

pressureDependency

A Boolean specifying whether the data depend on contact pressure. The default value is OFF.

temperatureDependency

A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies

An Int specifying the number of field variables. The default value is 0.

exponentialDecayDefinition

A SymbolicConstant specifying the exponential decay definition. Possible values are COEFFICIENTS and TEST_DATA. The default value is COEFFICIENTS.

table

A sequence of sequences of Floats specifying tangential behavior. The items in the table data are described below.

shearStressLimit

`None` or a Float specifying the shear stress limit. If *shearStressLimit*=`None`, there is no upper limit. The default value is `None`.

maximumElasticSlip A SymbolicConstant specifying what the maximum elastic slip will be. Possible values are FRACTION and ABSOLUTE_DISTANCE. The default value is FRACTION.

fraction A Float specifying the fraction of a characteristic surface dimension. The default value is 0.0.

absoluteDistance A Float specifying the absolute distance. The default value is 0.0.

elasticSlipStiffness `None` or a Float specifying the elastic slip stiffness. If *elasticSlipStiffness*=`None`, there is no upper limit. The default value is `None`.

nStateDependentVars An Int specifying the number of state-dependent variables. The default value is 0.

useProperties A Boolean specifying whether property values will be used. The default value is OFF.

Table data

If *formulation*=PENALTY or LAGRANGE, the table data specify the following:

- Friction coefficient in the first slip direction, μ_1.
- Friction coefficient in the second slip direction, μ_2 (if *directionality*=ANISOTROPIC).
- Slip rate, if the data depend on slip rate.
- Contact pressure, if the data depend on contact pressure.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *formulation*=EXPONENTIAL_DECAY and *exponentialDecayDefinition*=COEFFICIENTS, the table data specify the following:

- Static friction coefficient.
- Kinetic friction coefficient.
- Decay coefficient.

If *formulation*=EXPONENTIAL_DECAY and *exponentialDecayDefinition*=TEST_DATA, the table data specify the following:

- Friction coefficient.
- Slip rate.

If *formulation*=USER_DEFINED, the table data specify the following:

- Friction property.

Return value

A ContactTangentialBehavior object.

Exceptions

None.

setValues(...)

This method modifies the ContactTangentialBehavior object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ContactTangentialBehavior* method.

Return value

`None.`

Exceptions

None.

Members

The ContactTangentialBehavior object has the following members:

formulation

A SymbolicConstant specifying the friction formulation. Possible values are FRICTIONLESS, PENALTY, EXPONENTIAL_DECAY, ROUGH, LAGRANGE, and USER_DEFINED. The default value is FRICTIONLESS.

directionality

A SymbolicConstant specifying the directionality of the friction. Possible values are ISOTROPIC and ANISOTROPIC. The default value is ISOTROPIC.

slipRateDependency

A Boolean specifying whether the data depend on slip rate. The default value is OFF.

pressureDependency

A Boolean specifying whether the data depend on contact pressure. The default value is OFF.

temperatureDependency

A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies

An Int specifying the number of field variables. The default value is 0.

exponentialDecayDefinition

A SymbolicConstant specifying the exponential decay definition. Possible values are COEFFICIENTS and TEST_DATA. The default value is COEFFICIENTS.

shearStressLimit
`None` or a Float specifying the shear stress limit. If *shearStressLimit*=`None`, there is no upper limit. The default value is `None`.

maximumElasticSlip
A SymbolicConstant specifying what the maximum elastic slip will be. Possible values are FRACTION and ABSOLUTE_DISTANCE. The default value is FRACTION.

fraction
A Float specifying the fraction of a characteristic surface dimension. The default value is 0.0.

absoluteDistance
A Float specifying the absolute distance. The default value is 0.0.

elasticSlipStiffness
`None` or a Float specifying the elastic slip stiffness. If *elasticSlipStiffness*=`None`, there is no upper limit. The default value is `None`.

nStateDependentVars
An Int specifying the number of state-dependent variables. The default value is 0.

useProperties
A Boolean specifying whether property values will be used. The default value is OFF.

table
A tuple of tuples of Floats specifying tangential behavior. The items in the table data are described below.

Corresponding analysis keywords

- **FRICTION*
- **CHANGE FRICTION*

CyclicSymmetry object

The CyclicSymmetry object defines a cyclic symmetry analysis.

The CyclicSymmetry object is derived from the *Interaction* object.

Access

```
import interaction
mdb.models[name].interactions[name]
```

CyclicSymmetry(...)

This method creates a CyclicSymmetry object.

Path

```
mdb.models[name].CyclicSymmetry
```

Required arguments

name
A String specifying the repository key.

createStepName
A String specifying the name of the step in which the cyclic symmetry interaction should be created.

main
A *Region* object specifying the main surface.

secondary
A *Region* object specifying the secondary surface.

repetitiveSectors
An Int specifying the total number of sectors in the cyclic symmetric model.

axisPoint1
A *Region* object specifying the first point of the axis of symmetry. The region should contain exactly one mesh node, vertex, interesting point, reference point, or datum point. In a two-dimensional model *axisPoint1* is the only point used to define the axis of symmetry.

axisPoint2
A *Region* object specifying the second point of the axis of symmetry. The region should contain exactly one mesh node, vertex, interesting point, reference point, or datum point. This point is ignored in a two-dimensional model.

Optional arguments

extractedNodalDiameter
A SymbolicConstant specifying whether Abaqus should extract all possible nodal diameters or the nodal diameters between the user-specified values for *lowestNodalDiameter* and *highestNodalDiameter*. Possible values are ALL_NODAL_DIAMETER and SPECIFIED_NODAL_DIAMETER. The default value is ALL_NODAL_DIAMETER.

lowestNodalDiameter
An Int specifying the lowest nodal diameter to be used in the eigenfrequency analysis. The default value is 0.

highestNodalDiameter An Int specifying the highest nodal diameter to be used in the eigenfrequency analysis. This argument value should be less than or equal to the half of the total number of sectors (as specified in the *repetitiveSectors* parameter). The default value is 0.

excitationNodalDiameter An Int specifying the nodal diameter for which the modal-based steady-state dynamic analysis will be performed. This value should be greater than or equal to the lowest nodal diameter (specified in the *lowestNodalDiameter* parameter), and less than or equal to the highest nodal diameter (specified in the *highestNodalDiameter* parameter). The default value is 0.

adjustTie A Boolean specifying whether or not to adjust the secondary surface of the cyclic symmetry to tie it to the main surface. The default value is ON.

positionTolerance A Float specifying the position tolerance. The*positionTolerance* argument applies only when *positionToleranceMethod*=SPECIFY_TOLERANCE. The default value is 0.0.

positionToleranceMethod A SymbolicConstant specifying the method used to determine the position tolerance. Possible values are COMPUTED_TOLERANCE and SPECIFY_TOLERANCE. The default value is COMPUTED_TOLERANCE.

Return value

A CyclicSymmetry object.

Exceptions

None.

swapSurfaces()

This method switches the main and secondary surfaces of a cyclic symmetry interaction. This command is valid only during the step in which the interaction is created.

Arguments

None.

Return value

`None.`

Exceptions

None.

setValues(...)

This method modifies the data for an existing CyclicSymmetry object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *CyclicSymmetry* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data of an existing CyclicSymmetry object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the interaction is modified.

Optional arguments

extractedNodalDiameter A SymbolicConstant specifying whether Abaqus should extract all possible nodal diameters or the nodal diameters between the user-specified values for *lowestNodalDiameter* and *highestNodalDiameter*. Possible values are ALL_NODAL_DIAMETER and SPECIFIED_NODAL_DIAMETER. The default value is ALL_NODAL_DIAMETER.

lowestNodalDiameter An Int specifying the lowest nodal diameter to be used in the eigenfrequency analysis. The default value is 0.

highestNodalDiameter An Int specifying the highest nodal diameter to be used in the eigenfrequency analysis. This argument value should be less than or equal to the half of the total number of sectors (as specified in the *repetitiveSectors* parameter). The default value is 0.

excitationNodalDiameter An Int specifying the nodal diameter for which the modal-based steady-state dynamic analysis will be performed. This value should be greater than or equal to the lowest nodal diameter (specified in the *lowestNodalDiameter* parameter), and less than or equal to the highest nodal diameter (specified in the *highestNodalDiameter* parameter). The default value is 0.

Return value

`None.`

Exceptions

None.

Members

The CyclicSymmetry object has members with the same names and descriptions as the arguments to the *CyclicSymmetry* method except the optional arguments to the *setValuesInStep* method.

CyclicSymmetryState object

The CyclicSymmetryState object stores the propagating data for a *CyclicSymmetry* object. One instance of this object is created internally by the *CyclicSymmetry* object for each step. The instance is also deleted internally by the *CyclicSymmetry* object.

The CyclicSymmetryState object has no constructor or methods.

The CyclicSymmetryState object is derived from the *InteractionState* object.

Access

```
import interaction
mdb.models[name].steps[name].interactionStates[name]
```

Members

The CyclicSymmetryState object has the following members:

extractedNodalDiameter

A SymbolicConstant specifying whether Abaqus should extract all possible nodal diameters or the nodal diameters between the user-specified values for *lowestNodalDiameter* and *highestNodalDiameter*. Possible values are ALL_NODAL_DIAMETER and SPECIFIED_NODAL_DIAMETER. The default value is ALL_NODAL_DIAMETER.

extractedNodalDiameterState

A SymbolicConstant specifying the propagation state of the *extractedNodalDiameter* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

lowestNodalDiameter

An Int specifying the lowest nodal diameter to be used in the eigenfrequency analysis. The default value is 0.

lowestNodalDiameterState

A SymbolicConstant specifying the propagation state of the *lowestNodalDiameter* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

highestNodalDiameter

An Int specifying the highest nodal diameter to be used in the eigenfrequency analysis. This argument value should be less than or equal to the half of the total number of sectors. The default value is 0.

highestNodalDiameterState

A SymbolicConstant specifying the propagation state of the *highestNodalDiameter* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

excitiationNodalDiameter

An Int specifying the nodal diameter for which the modal-based steady-state dynamic analysis will be performed. This value should be greater than or equal to the lowest nodal diameter (specified in the *lowestNodalDiameter* parameter), and less than or equal to the highest nodal diameter (specified in the *highestNodalDiameter* parameter). The default value is 0.

excitiationNodalDiameterState

A SymbolicConstant specifying the propagation state of the *excitiationNodalDiameter* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *InteractionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

ElasticFoundation object

The ElasticFoundation object defines a mechanical foundation.

The ElasticFoundation object is derived from the *Interaction* object.

Access

```
import interaction
mdb.models[name].interactions[name]
```

ElasticFoundation(...)

This method creates an ElasticFoundation object.

Path

```
mdb.models[name].ElasticFoundation
```

Required arguments

name	A String specifying the repository key.
createStepName	A String specifying the name of the step in which the ElasticFoundation object is created. *createStepName* must be set to 'Initial'.
surface	A *Region* object specifying the surface to which the foundation applies.
stiffness	A Float specifying the foundation stiffness per area (or per length for beams).

Optional arguments

None.

Return value

An ElasticFoundation object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing ElasticFoundation object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ElasticFoundation* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data of an existing ElasticFoundation object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the interaction is modified.

Optional arguments

stiffness A Float specifying the foundation stiffness per area (or per length for beams).

Return value

`None.`

Exceptions

None.

Members

The ElasticFoundation object has members with the same names and descriptions as the arguments to the *ElasticFoundation* method except the optional arguments to the *setValuesInStep* method.

Corresponding analysis keywords

- **FOUNDATION*

ElasticFoundationState object

The ElasticFoundationState object stores the propagating data for an *ElasticFoundation* object. One instance of this object is created internally by the *ElasticFoundation* object for each step. The instance is also deleted internally by the *ElasticFoundation* object.

The ElasticFoundationState object has no constructor or methods.

The ElasticFoundationState object is derived from the *InteractionState* object.

Access

```
import interaction
mdb.models[name].steps[name].interactionStates[name]
```

Members

The ElasticFoundationState object has the following members:

stiffness

A Float specifying the foundation stiffness per area.

stiffnessState

A SymbolicConstant specifying the propagation state of the stiffness member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *InteractionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

ExpContactControl object

The ExpContactControl object is used in Abaqus/Explicit analyses to specify optional solution controls for problems involving contact between bodies.

The ExpContactControl object is derived from the *ContactControl* object.

Access

```
import interaction
mdb.models[name].contactControls[name]
```

ExpContactControl(...)

This method creates an ExpContactControl object.

Path

```
mdb.models[name].ExpContactControl
```

Required arguments

name
A String specifying the contact controls repository key.

Optional arguments

globTrkChoice
A SymbolicConstant specifying whether or not the default value will be used for the maximum number of increments between global contact searches. Possible values are DEFAULT and SPECIFY. The default value is DEFAULT.

globTrkInc
An Int specifying the maximum number of increments between global contact searches. The *globTrkInc* argument applies only when *globTrkChoice*=SPECIFY. The default value is 100 for surface-to-surface contact and 4 for self-contact.

fastLocalTrk
A Boolean specifying whether to use the more computationally efficient local tracking method. The default value is ON.

scalePenalty
A Float specifying the factor by which Abaqus/Explicit will scale the default penalty stiffness to obtain the stiffnesses used for the penalty contact pairs. The default value is 1.0.

warpCheckPeriod
An Int specifying the number of increments between checks for highly warped facets on main surfaces. The default value is 20.

warpCutoff
A Float specifying the out-of-plane warping angle (in degrees), at which a facet will be considered to be highly warped. The default value is 20.0.

Return value

An ExpContactControl object.

Exceptions

RangeError.

setValues(...)

This method modifies the ExpContactControl object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ExpContactControl* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The ExpContactControl object has members with the same names and descriptions as the arguments to the *ExpContactControl* method.

Corresponding analysis keywords

- **CONTACT CONTROLS*

ExpInitialization object

The ExpInitialization object is used in conjunction with *ContactExp* in Abaqus/Explicit analyses to specify contact initialization data.

The ExpInitialization object is derived from the *ContactInitialization* object.

Access

```
import interaction
mdb.models[name].contactInitializations[name]
```

ExpInitialization(...)

This method creates an ExpInitialization object.

Path

```
mdb.models[name].ExpInitialization
```

Required arguments

name
A String specifying the contact initialization repository key.

Optional arguments

overclosureType
A SymbolicConstant specifying the type of overclosure to be defined. Possible values are ADJUST, INTERFERENCE, and CLEARANCE. The default value is ADJUST.

interferenceDistance
`None` or a Float specifying the interference distance. This argument is valid only when *overclosureType*=INTERFERENCE. The default value is `None`.

clearanceDistance
`None` or a Float specifying the initial clearance distance. This argument is valid only when *overclosureType*=CLEARANCE and must be specified in that case. The default value is `None`.

openingTolerance
`None` or a Float specifying the distance tolerance within which initial openings will undergo strain-free adjustments. This argument is not valid when *overclosureType*=INTERFERENCE unless a value has been specified for *interferenceDistance*. The default value is `None`.

overclosureTolerance
`None` or a Float specifying the distance tolerance within which initial overclosures will undergo strain-free adjustments. The default value is `None`.

adjustNodalCoords
A Boolean specifying whether to resolve clearances/overclosures by adjusting the nodal coordinates without creating strain in the model. *adjustNodalCoords*=True can be used only for clearances/overclosures defined in the first step of an analysis. The default value is `True`.

secondaryNodesetName A String specifying the name of the node set containing the secondary nodes to be included in the initial clearance specification. This argument is not valid when *overclosureType*=INTERFERENCE and if *openingTolerance* or *overclosureTolerance* is specified. The default value is `None`.

stepFraction A Float specifying the fraction of the step time (between 0.0 and 1.0) in which the interference fit has to be solved. The default value is 1.0. This argument is valid only when *overclosureType*=INTERFERENCE.

Return value

An ExpInitialization object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the ExpInitialization object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ExpInitialization* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The ExpInitialization object has members with the same names and descriptions as the arguments to the *ExpInitialization* method.

Corresponding analysis keywords

FilmCondition object

The FilmCondition object defines film coefficients and associated sink temperatures for coupled temperature-displacement analyses.

The FilmCondition object is derived from the *Interaction* object.

Access

```
import interaction
mdb.models[name].interactions[name]
```

FilmCondition(...)

This method creates a FilmCondition object.

Path

```
mdb.models[name].FilmCondition
```

Required arguments

name
A String specifying the repository key.

createStepName
A String specifying the name of the step in which the FilmCondition object is created.

region
A *Region* object specifying the name of the surface to which the film condition interaction is applied or an Element set object specifying the elements to which the element-based film condition is applied.

definition
A SymbolicConstant specifying how the film condition is defined. Possible values are EMBEDDED_COEFF, PROPERTY_REF, USER_SUB, and FIELD.

Optional arguments

interactionProperty
A String specifying the name of the *FilmConditionProp* object associated with this interaction. The *interactionProperty* argument applies only when *definition*=PROPERTY_REF. The default value is an empty string.

sinkTemperature
A Float specifying the reference sink temperature, θ^0. The default value is 0.0.

sinkAmplitude
A String specifying the name of the *Amplitude* object that gives the variation of the sink temperature, θ^0, with time. The default value is an empty string.

Note:

Use empty string in an Abaqus/Standard analysis to specify that the reference sink temperature is applied immediately at the beginning of the step or linearly over the step. Use empty string in an Abaqus/Explicit analysis to specify that the reference sink temperature is applied throughout the step.

filmCoeff

A Float specifying the reference film coefficient value, h. The *filmCoeff* argument applies when *definition*=EMBEDDED_COEFF, *definition*=USER_SUB, or *definition*=FIELD. The default value is 0.0.

filmCoeffAmplitude

A String specifying the name of the *Amplitude* object that gives the variation of the film coefficient, h, with time. The default value is an empty string.

Note: Use empty string in an Abaqus/Standard analysis to specify that the reference film coefficient is applied immediately at the beginning of the step or linearly over the step. Use empty string in an Abaqus/Explicit analysis to specify that the reference film coefficient is applied throughout the step.

field

A String specifying the name of the *AnalyticalField* object associated with this interaction. The *field* argument applies only when *definition*=FIELD. The default value is an empty string.

sinkFieldName

A String specifying the name of the *AnalyticalField* or *DiscreteField* object associated with the sink temperature. The *sinkFieldName* argument applies only when *sinkDistributionType*=ANALYTICAL_FIELD or *sinkDistributionType*=DISCRETE_FIELD. The default value is an empty string.

sinkDistributionType

A SymbolicConstant specifying how the sink temperature is distributed. Possible values are UNIFORM, ANALYTICAL_FIELD, and DISCRETE_FIELD. The default value is UNIFORM.

dynamicSurfaceActivation

A Boolean specifying the activation of an element-based film condition on evolving faces of an element.

Return value

A FilmCondition object.

Exceptions

None.

`setValues(...)`

This method modifies the data for an existing FilmCondition object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *FilmCondition* method, except for the *name* and *createStepName* arguments.

Return value
`None.`

Exceptions
None.

`setValuesInStep(...)`

This method modifies the propagating data of an existing FilmCondition object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the interaction is modified.

Optional arguments
The optional arguments to `setValuesInStep` are the same as the optional arguments to the `FilmConditionState` method.

Return value
`None.`

Exceptions
None.

Members
The FilmCondition object has members with the same names and descriptions as the arguments to the *FilmCondition* method except the optional arguments to the *setValuesInStep* method.

FilmConditionProp object

The FilmConditionProp object is an interaction property that defines a film coefficient as a function of temperature and field variables.

The FilmConditionProp object is derived from the *InteractionProperty* object.

Access

```
import interaction
mdb.models[name].interactionProperties[name]
```

FilmConditionProp(...)

This method creates a FilmConditionProp object.

Path

```
mdb.models[name].FilmConditionProp
```

Required arguments

name A String specifying the interaction property repository key.

Optional arguments

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

property A sequence of sequences of Floats specifying the following:

- The film coefficient, h.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A FilmConditionProp object.

Exceptions

None.

setValues(...)

This method modifies the FilmConditionProp object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *FilmConditionProp* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The FilmConditionProp object has members with the same names and descriptions as the arguments to the *FilmConditionProp* method.

```

Members

The FilmConditionState object has the following members:

interactionPropertyState
A SymbolicConstant specifying the propagation state of the *interactionProperty* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

sinkTemperature
A Float specifying the sink temperature.

sinkTemperatureState
A SymbolicConstant specifying the propagation state of the *sinkTemperature* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

sinkAmplitudeState
A SymbolicConstant specifying the propagation state of the *sinkAmplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

filmCoeff
A Float specifying the film coefficient.

filmCoeffState
A SymbolicConstant specifying the propagation state of the *filmCoeff* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

filmCoeffAmplitudeState
A SymbolicConstant specifying the propagation state of the *filmCoeffAmplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

interactionProperty
A String specifying the *FilmConditionProp* object associated with this interaction.

sinkAmplitude
A String specifying the name of the Amplitude object that gives the variation of the sink temperature.

filmCoeffAmplitude
A String specifying the name of the Amplitude object that gives the variation of the film coefficient.

status
A SymbolicConstant specifying the propagation state of the *InteractionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED

- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

FluidCavity object

The FluidCavity object defines a surface-based cavity.

The FluidCavity object is derived from the *Interaction* object.

Access

```
import interaction
mdb.models[name].interactions[name]
```

FluidCavity(...)

This method creates an FluidCavity object.

Path

```
mdb.models[name].FluidCavity
```

Required arguments

name	A String specifying the repository key.
createStepName	A String specifying the name of the step in which the FluidCavity object is created.
cavityPoint	A *Region* object specifying the fluid cavity reference point.
cavitySurface	A *Region* object specifying the surface forming the boundary of the fluid cavity.
interactionProperty	A String specifying the *FluidCavityProperty* object associated with this interaction.

Optional arguments

ambientPressure	A Float specifying the magnitude of the ambient pressure. The default value is 0.0.
thickness	A Float specifying the out-of-plane thickness of the surface for two-dimensional models. This argument is valid only when using two-dimensional models. The default value is 1.0.
useAdiabatic	A Boolean specifying whether adiabatic behavior is assumed for the ideal gas. This argument is valid only when *interactionProperty* specifies a pneumatic definition. The default value is OFF.
checkNormals	A Boolean specifying whether the analysis will check the consistency of the surface normals. The default value is ON.

Return value

A FluidCavity object.

Exceptions

None.

setValues(...)

This method modifies the FluidCavity object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *FluidCavity* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

Members

The FluidCavity object has members with the same names and descriptions as the arguments to the *FluidCavity* method.

Corresponding analysis keywords

- **FLUID CAVITY*

FluidCavityProperty object

The FluidCavityProperty object is an interaction property that defines the fluid behavior for a surface-based fluid cavity.

The FluidCavityProperty object is derived from the *InteractionProperty* object.

Access

```
import interaction
mdb.models[name].interactionProperties[name]
```

FluidCavityProperty(...)

This method creates a FluidCavityProperty object.

Path

```
mdb.models[name].FluidCavityProperty
```

Required arguments

name A String specifying the interaction property repository key.

Optional arguments

definition A SymbolicConstant specifying the type of fluid cavity property to be defined. Possible values are HYDRAULIC and PNEUMATIC. The default value is HYDRAULIC.

fluidDensity `None` or a Float specifying the reference fluid density. This argument is applicable only when *definition*=HYDRAULIC, and is required in that case. The default value is `None`.

molecularWeight `None` or a Float specifying the molecular weight of the ideal gas species. This argument is applicable only when *definition*=PNEUMATIC, and is required in that case. The default value is `None`.

useExpansion A Boolean specifying whether thermal expansion coefficients will be defined. This argument is applicable only when *definition*=HYDRAULIC. The default value is OFF.

expansionTempDep A Boolean specifying whether the thermal fluid expansion data will have temperature dependency. This argument is applicable only when *definition*=HYDRAULIC and when *useExpansion*=True. The default value is OFF.

expansionDependencies An Int specifying the number of field variable dependencies in the thermal fluid expansion data. This argument is applicable only when *definition*=HYDRAULIC and when *useExpansion*=True. The default value is 0.

referenceTemperature A Float specifying the reference temperature for the coefficient of thermal expansion. This argument is applicable only when *definition*=HYDRAULIC, when

useExpansion=True, and when either *expansionTempDep*=True or when *expansionDependencies* is greater than 0. The default value is 0.0.

expansionTable

A sequence of sequences of Floats specifying the thermal expansion coefficients. This argument is applicable only when *definition*=HYDRAULIC and when *useExpansion*=True. Each sequence contains the following data:

- The mean coefficient of thermal expansion.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

useBulkModulus

A Boolean specifying whether fluid bulk modulus values will be defined. This argument is applicable only when *definition*=HYDRAULIC. The default value is OFF.

bulkModulusTempDep

A Boolean specifying whether the fluid bulk modulus data will have temperature dependency. This argument is applicable only when *definition*=HYDRAULIC and when *useBulkModulus*=True. The default value is OFF.

bulkModulusDependencies

An Int specifying the number of field variable dependencies in the fluid bulk modulus data. This argument is applicable only when *definition*=HYDRAULIC and when *useBulkModulus*=True. The default value is 0.

bulkModulusTable

A sequence of sequences of Floats specifying the fluid bulk modulus values. This argument is applicable only when *definition*=HYDRAULIC and when *useBulkModulus*=True. Each sequence contains the following data:

- The fluid bulk modulus.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

useCapacity

A Boolean specifying whether molar heat capacity values will be defined. This argument is applicable only when *definition*=PNEUMATIC. The default value is OFF.

capacityType

A SymbolicConstant specifying the method to define the molar heat capacity. Possible values are POLYNOMIAL and TABULAR. The default value is POLYNOMIAL.

capacityTempDep

A Boolean specifying whether the molar heat capacity data will have temperature dependency. This argument is applicable only when *definition*=PNEUMATIC, when *useCapacity*=True, and when *capacityType*=TABULAR. The default value is OFF.

capacityDependencies

An Int specifying the number of field variable dependencies in the molar heat capacity data. This argument is applicable only when *definition*=PNEUMATIC, when *useCapacity*=True, and when *capacityType*=TABULAR. The default value is 0.

capacityTable

A sequence of sequences of Floats specifying the molar heat capacity values in the form of a polynomial expression. This argument is applicable only when *definition*=PNEUMATIC, when *useCapacity*=True, and when *capacityType*=POLYNOMIAL. In this form, only one sequence is specified and that sequence contains the following data:

- The first molar heat capacity coefficient.
- The second molar heat capacity coefficient.
- The third molar heat capacity coefficient.
- The fourth molar heat capacity coefficient.
- The fifth molar heat capacity coefficient.

Alternatively, the sequence data may specify the molar heat capacity values at constant pressure for an ideal gas species. This argument is applicable only when *definition*=PNEUMATIC, when *useCapacity*=True, and when *capacityType*=TABULAR. Each sequence contains the following data:

- The molar heat capacity at constant pressure.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A FluidCavityProperty object.

Exceptions

None.

`setValues(...)`

This method modifies the FluidCavityProperty object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *FluidCavityProperty* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

- BUILT_INTO_BASE_STATE

FluidExchangeActivation object

The FluidExchnageActivation object is used to define the activation of fluid exchanges within the fluid cavity.

The FluidExchangeActivation object is derived from the *Interaction* object.

Access

```
import interaction
mdb.models[name].interactions[name]
```

FluidExchangeActivation(...)

This method creates a FluidExchangeActivation object.

Path

```
mdb.models[name].FluidExchangeActivation
```

Required arguments

name	A String specifying the repository key.
createStepName	A String specifying the name of the step in which the FluidExchange object is created.
exchanges	A List specifying fluid exchanges to be activated.

Optional arguments

amplitude	A String specifying the name of the amplitude curve defining a mapping between the inflation time and the actual time.
isBlockage	A Boolean specifying the vent and leakage area obstruction by contacted surfaces.
isOnlyOutflow	A Boolean specifying if the flow of fluid is only from the first fluid cavity to the second fluid cavity defined in the *FluidExchange* object.
deltaLeakageArea	A Float specifying the ratio of the actual surface area over the initial surface area at which you want the fluid to leak.

Return value

A FluidExchangeActivation object.

Exceptions

None.

setValues(...)

This method modifies the FluidExchangeActivation object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *FluidExchangeActivation* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

Members

The FluidExchangeActivationState object has the following members:

exchangesState

A SymbolicConstant specifying the propagation state of the *exchanges* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

exchanges

A String specifying the name of the *FluidExchange* object associated with this interaction.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

amplitude

A String specifying the name of the *Amplitude* object associated with this interaction.

isBlockageState

A SymbolicConstant specifying the propagation state of the *isBlockage* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

isBlockage

A Boolean specifying whether to consider vent and leakage area obstruction by contacted surfaces.

isOnlyOutflowState

A SymbolicConstant specifying the propagation state of the *isOnlyOutflow* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

isOnlyOutflow

A Boolean specifying whether the flow of fluid is allowed only from the first fluid cavity to the second fluid cavity defined in the *FluidExchange* object.

deltaLeakageAreaState

A SymbolicConstant specifying the propagation state of the *deltaLeakageArea* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

deltaLeakageArea

A Float specifying the ratio of the actual surface area over the initial surface area at which you want the fluid to leak.

status

A *SymbolicConstant* specifying the propagation state of the *InteractionState* object. Possible values are:

- NOT_YET_ACTIVE

- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

FluidExchange object

The FluidExchange object is used to define fluid exchange between two fluid cavities or between a fluid cavity and its environment.

The FluidExchange object is derived from the *Interaction* object.

Access

```
import interaction
mdb.models[name].interactions[name]
```

FluidExchange(...)

This method creates an FluidExchange object.

Path

```
mdb.models[name].FluidExchange
```

Required arguments

name
A String specifying the repository key.

createStepName
A String specifying the name of the step in which the FluidExchange object is created.

firstCavity
A String specifying the first *FluidCavity* object associated with this interaction. This will be the only cavity specified if *definition*=TO_ENVIRONMENT.

interactionProperty
A String specifying the *FluidExchangeProperty* object associated with this interaction.

Optional arguments

definition
A SymbolicConstant specifying the type of fluid exchange to be defined. Possible values are TO_ENVIRONMENT and BETWEEN_CAVITIES. The default value is TO_ENVIRONMENT.

secondCavity
A String specifying the second *FluidCavity* object associated with this interaction. This argument is applicable only when *definition*=BETWEEN_CAVITIES.

exchangeArea
A Float specifying the effective exchange area. The default value is 1.0.

Return value

A FluidExchange object.

Exceptions

None.

`setValues(...)`

This method modifies the FluidExchange object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *FluidExchange* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

FluidExchangeProperty object

The FluidExchangeProperty object is an interaction property that defines the fluid exchange property for a flow between two fluid cavities or between a fluid cavity and its environment.

The FluidExchangeProperty object is derived from the *InteractionProperty* object.

Access

```
import interaction
mdb.models[name].interactionProperties[name]
```

FluidExchangeProperty(...)

This method creates a FluidExchangeProperty object.

Path

```
mdb.models[name].FluidExchangeProperty
```

Required arguments

name A String specifying the interaction property repository key.

dataTable A sequence of sequences of Floats specifying the viscous and hydrodynamic resistance coefficients when *definition*=BULK_VISCOSITY. Each sequence contains the following data:

- The viscous resistance coefficient.
- The hydrodynamic resistance coefficient.
- The average absolute pressure, if the data depend on pressure.
- The average temperature, if the data depend on temperature.
- The value of the first field variable, if the data depend on field variables.
- The value of the second field variable.
- Etc.

Alternatively, the sequence data may specify the mass flow rate. This is applicable only when *definition*=MASS_FLUX. In this form, only one sequence is specified and that sequence contains the following data:

- The mass flow rate per unit area.

Alternatively, the sequence data may specify the mass rate leakage. This is applicable only when *definition*=MASS_RATE_LEAK. Each sequence contains the following data:

- The absolute value of the mass flow rate per unit area. (The first tabular value entered must always be zero.)
- The absolute value of the pressure difference. (The first tabular value entered must always be zero.)
- The average absolute pressure, if the data depend on pressure.
- The average temperature, if the data depend on temperature.
- The value of the first field variable, if the data depend on field variables.

- The value of the second field variable.
- Etc.

Alternatively, the sequence data may specify the volume flow rate. This is applicable only when *definition*=VOL_FLUX. In this form, only one sequence is specified and that sequence contains the following data:

- The volumetric flow rate per unit area.

Alternatively, the sequence data may specify the volume rate leakage. This is applicable only when *definition*=VOL_RATE_LEAK. Each sequence contains the following data:

- The absolute value of the volumetric flow rate per unit area. (The first tabular value entered must always be zero.)
- The absolute value of the pressure difference. (The first tabular value entered must always be zero.)
- The average absolute pressure, if the data depend on pressure.
- The average temperature, if the data depend on temperature.
- The value of the first field variable, if the data depend on field variables.
- The value of the second field variable.
- Etc.

Optional arguments

definition A SymbolicConstant specifying the type of fluid exchange property to be defined. Possible values are BULK_VISCOSITY, MASS_FLUX, MASS_RATE_LEAK, VOL_FLUX, and VOL_RATE_LEAK. The default value is BULK_VISCOSITY.

pressureDependency A Boolean specifying whether the data will have pressure dependency. This argument is applicable only when *definition*=BULK_VISCOSITY, or when *definition*=MASS_RATE_LEAK, or when *definition*=VOL_RATE_LEAK. The default value is OFF.

temperatureDependency A Boolean specifying whether the data will have temperature dependency. This argument is applicable only when *definition*=BULK_VISCOSITY, or when *definition*=MASS_RATE_LEAK, or when *definition*=VOL_RATE_LEAK. The default value is OFF.

fieldDependencies An Int specifying the number of field variable dependencies in the data. This argument is applicable only when *definition*=BULK_VISCOSITY, or when *definition*=MASS_RATE_LEAK, or when *definition*=VOL_RATE_LEAK. The default value is 0.

Return value

A FluidExchangeProperty object.

Exceptions

None.

`setValues(...)`

This method modifies the FluidExchangeProperty object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *FluidExchangeProperty* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The FluidExchangeProperty object has members with the same names and descriptions as the arguments to the *FluidExchangeProperty* method.

Corresponding analysis keywords

- **FLUID EXCHANGE PROPERTY*

FluidExchangeState object

The FluidExchangeState object stores the propagating data for an *FluidExchange* object. One instance of this object is created internally by the *FluidExchange* object for each step. The instance is also deleted internally by the *FluidExchange* object.

The FluidExchangeState object has no constructor or methods.

The FluidExchangeState object is derived from the *InteractionState* object.

Access

```
import interaction
mdb.models[name].steps[name].interactionStates[name]
```

Members

The FluidExchangeState object has the following member:

status

A SymbolicConstant specifying the propagation state of the *InteractionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

FluidInflatorActivation object

The FluidInflatorActivation object is used to define the activation of fluid inflators to model the deployment of an airbag.

The FluidInflatorActivation object is derived from the *Interaction* object.

Access

```
import interaction
mdb.models[name].interactions[name]
```

FluidInflatorActivation(...)

This method creates a FluidInflatorActivation object.

Path

```
mdb.models[name].FluidInflatorActivation
```

Required arguments

name	A string specifying the repository key.
createStepName	A string specifying the name of the step in which the FluidInflator object is created.
inflators	A list specifying fluid inflators to be activated.

Optional arguments

inflationTimeAmplitude	A string specifying the name of the amplitude curve defining a mapping between the inflation time and the actual time.
massFlowAmplitude	A string specifying the name of the amplitude curve by which to modify the mass flow rate.

Return value

A FluidInflatorActivation object.

Exceptions

None.

setValues(...)

This method modifies the FluidInflatorActivation object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *FluidInflatorActivation* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

Members

The FluidInflatorActivation object has members with the same names and descriptions as the arguments to the *FluidInflatorActivation* method.

FluidInflatorActivationState object

The FluidInflatorActivationState object stores the propagating data for a FluidInflatorActivation object.
One instance of this object is created internally by the *FluidInflatorActivation* object for each step. The instance is also deleted internally by the *FluidInflatorActivation* object.

The FluidInflatorActivationState object has no constructor or methods.

The FluidInflatorActivationState object is derived from the *InteractionState* object.

Access

```
import interaction
mdb.models[name].steps[name].interactionStates[name]
```

Members

The FluidInflatorActivationState object has the following member:

inflatorsState
A SymbolicConstant specifying the propagation state of the *inflators* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

inflators
A String specifying the name of the *FluidInflator* object associated with this interaction.

inflationTimeAmplitudeState
A SymbolicConstant specifying the propagation state of the *inflationTimeAmplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

inflationTimeAmplitude
A String specifying the name of the *Amplitude* object associated with this interaction.

massFlowAmplitudeState
A SymbolicConstant specifying the propagation state of the *massFlowAmplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

massFlowAmplitude
A String specifying the name of the *Amplitude* object associated with this interaction.

status
A *SymbolicConstant* specifying the propagation state of the *InteractionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

FluidInflator object

The FluidInflator object is used to define a fluid inflator to model deployment of an airbag.

The FluidInflator object is derived from the *Interaction* object.

Access

```
import interaction
mdb.models[name].interactions[name]
```

FluidInflator(...)

This method creates a FluidInflator object.

Path

```
mdb.models[name].FluidInflator
```

Required arguments

name	A String specifying the repository key.
createStepName	A String specifying the name of the step in which the FluidInflator object is created.
cavity	A String specifying the first *FluidCavity* object associated with this interaction.
interactionProperty	A String specifying the *FluidInflatorProperty* object associated with this interaction.

Return value

A FluidInflator object.

Exceptions

None.

setValues(...)

This method modifies the FluidInflator object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *FluidInflator* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

Members

The FluidInflator object has members with the same names and descriptions as the arguments to the *FluidInflator* method.

Corresponding analysis keywords

- **FLUID INFLATOR*

FluidInflatorProperty object

The FluidInflatorProperty object is an interaction property that defines a fluid inflator property to model the deployment of an airbag.
The inflator property defines the mass flow rate and temperature as a function of inflation time either directly or by entering tank test data. It also defines the mixture of gases entering the fluid cavity.

The FluidInflatorProperty object is derived from the *InteractionProperty* object.

Access

```
import interaction
mdb.models[name].interactionProperties[name]
```

FluidInflatorProperty(...)

This method creates a FluidInflatorProperty object.

Path

```
mdb.models[name].FluidInflatorProperty
```

Required arguments

name A String specifying the interaction property repository key.

definition A Symbolic constant specifying the method used for modeling the flow characteristics of inflators. The default value is *definition*=DUAL PRESSURE. The possible values are DUAL PRESSURE, PRESSURE AND MASS, TANK TEST, and TEMPERATURE AND MASS.

effectiveArea A Float specifying the total inflator orifice area. This argument is applicable only if *definition*=DUAL PRESSURE or *definition*=PRESSURE AND MASS.

tankVolume A Float specifying the tank volume. This argument is applicable only if *definition*=DUAL PRESSURE or *definition*=TANK TEST.

Optional arguments

dischargeCoefficient A Float specifying the discharge coefficient. This argument is applicable only if *definition*=DUAL PRESSURE or *definition*=PRESSURE AND MASS.

dataTable A sequence of sequences of Floats specifying the items described in the "Table data" section below.

numFluids An Int specifying the number of gas species used for this inflator.

mixtureType A Symbolic constant specifying whether to use mass fraction or the molar fraction for a mixture of ideal gases. The default value is MASS FRACTION. The possible values are MASS FRACTION or MOLAR FRACTION.

inflationTime A sequence of sequences of Floats specifying the inflation time.

fluidbehaviorName A sequence of sequences of Strings specifying fluid behavior names.

massFraction A sequence of sequences of Floats specifying the mass fraction or the molar fraction corresponding to entered fluid behavior.

Table data

If *definition*=DUAL PRESSURE, the table data specify the following:

- Inflation time.
- Inflator pressure.
- Tank pressure.

If *definition*=PRESSURE AND MASS, the table data specify the following:

- Inflation time.
- Inflator pressure.
- Inflator mass flow rate.

If *definition*=TANK TEST, the table data specify the following:

- Inflation time.
- Inflator gas temperature.
- Tank pressure.

If *definition*=TEMPERATURE AND MASS, the table data specify the following:

- Inflation time.
- Inflator gas temperature.
- Inflator mass flow rate.

Return value

A FluidInflatorProperty object.

Exceptions

None.

`setValues(...)`

This method modifies the FluidInflatorProperty object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *FluidInflatorProperty* method, except for the *name* argument.

Return value
`None.`

Exceptions
None.

Members
The FluidInflatorProperty object has members with the same names and descriptions as the arguments to the *FluidInflatorProperty* method.

FractureCriterion object

The FractureCriterion object specifies fractureCriterion options for a contact interaction property.

Access

```
import interaction
mdb.models[name].interactionProperties[name].fractureCriterion
```

FractureCriterion(...)

This method creates a FractureCriterion object.

Path

```
mdb.models[name].interactionProperties[name].FractureCriterion
```

Required arguments

initTable
A sequence of sequences of Floats specifying the value defining the fracture criterion. The items in the table data are described below.

Optional arguments

type
A SymbolicConstant specifying the type of data used to define the fracture criterion. Possible values are VCCT and ENHANCED VCCT. The default value is VCCT.

mixedModeBehavior
A SymbolicConstant specifying the mixed mode behavior type used to define fracture criterion. Possible values are BK, POWER, and REEDER. The default value is BK.

temperatureDependency
A Boolean specifying whether the fracture criterion data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of fracture criterion data field variables. The default value is 0.

tolerance
A Float specifying the tolerance for VCCT\Enhanced VCCT type. The default value is 0.2.

specifyUnstableCrackProp
A SymbolicConstant specifying whether to include unstable crack growth tolerance in fracture criterion. Possible values are ON and OFF. The default value is OFF.

unstableTolerance
The SymbolicConstant DEFAULT or a Float specifying the tolerance for unstable crack propagation. This parameter specified only if *specifyUnstableCrackProp*=ON. The default value is DEFAULT.

Table data

Table data for *initTable*:

If *type*=VCCT for *mixedModeBehavior*=BK or REEDER, the table data specify the following:

- Mode I critical energy release rate, G_{IC}.
- Mode II critical energy release rate, G_{IIC}.
- Mode III critical energy release rate, G_{IIIC}.
- Exponent, η.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=VCCT for *mixedModeBehavior*=POWER, the table data specify the following:

- Mode I critical energy release rate, G_{IC}.
- Mode II critical energy release rate, G_{IIC}.
- Mode III critical energy release rate, G_{IIIC}.
- Exponent, am.
- Exponent, an.
- Exponent, ao.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=ENHANCED VCCT for *mixedModeBehavior*=BK or REEDER, the table data specify the following:

- Mode I critical energy release rate for onset crack, G_{IC}.
- Mode II critical energy release rate for onset crack, G_{IIC}.
- Mode III critical energy release rate for onset crack, G_{IIIC}.
- Mode I critical energy release rate for crack propagation, G_{IC}.
- Mode II critical energy release rate for crack propagation, G_{IIC}.
- Mode III critical energy release rate for crack propagation, G_{IIIC}.
- Exponent, η.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=ENHANCED VCCT for *mixedModeBehavior*=POWER, the table data specify the following:

- Mode I critical energy release rate for onset crack, G_{IC}.
- Mode II critical energy release rate for onset crack, G_{IIC}.

- Mode III critical energy release rate for onset crack, G_{IIIC}.
- Mode I critical energy release rate for crack propagation, G_{IC}.
- Mode II critical energy release rate for crack propagation, G_{IIC}.
- Mode III critical energy release rate for crack propagation, G_{IIIC}.
- Exponent, am.
- Exponent, an.
- Exponent, ao.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A FractureCriterion object.

Exceptions

None.

setValues(...)

This method modifies the FractureCriterion object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *FractureCriterion* method.

Return value

`None.`

Exceptions

None.

Members

The FractureCriterion object has members with the same names and descriptions as the arguments to the *FractureCriterion* method.

GapDiffusivity object

The GapDiffusivity object specifies gap diffusivity for a contact interaction property.

Access

```
import interaction
mdb.models[name].interactionProperties[name].diffusivity
```

Diffusivity(...)

This method creates a GapDiffusivity object.

Path

```
mdb.models[name].interactionProperties[name].Diffusivity
```

Required arguments

Type
A SymbolicConstant specifying how the contact diffusivity is defined. Possible values are ION_CONCENTRATION or SPECIES_CONCENTRATION.

Optional arguments

cutoffFlowAcrossDist
A Float specifying a cutoff clearance distance above which no ion or species diffusion occurs across a contact interface.

cutoffGapFillDist
A Float specifying a cutoff clearance distance above which no ion or species diffusion occurs into or out of a contact interface due to changes in the clearance distance.

dependencies
An Int specifying the number of field variables to use with clearance dependency. The default value is 0.

concentrationDepTable
A sequence of sequences of Floats specifying concentration dependency data. The items in the table data are described below.

Table data

For *Type* = *ION_CONCENTRATION* with the *concentrationDepTable* data specify the following:

- Contact Diffusivity.
- Contact Pressure.
- Average Ion Concentration.
- Average Temperature
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

For *Type* = *SPECIES_CONCENTRATION* with the *concentrationDepTable* data specify the following:

- Contact Diffusivity.
- Contact Pressure.
- Average Species Concentration.
- Average Temperature
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A GapDiffusivity object.

Exceptions

None.

`setValues(...)`

This method modifies the GapDiffusvity object.

Required arguments

The required arguments to `setValues` are the same as the arguments to the *GapDiffusivity object* method.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *GapDiffusivity object* method.

Return value

`None.`

Exceptions

None.

GapElectricalConductance object

The GapElectricalConductance object specifies electrical conductance for a contact interaction property.

Access

```
import interaction
mdb.models[name].interactionProperties[name].electricalConductance
```

ElectricalConductance(...)

This method creates a GapElectricalConductance object.

Path

```
mdb.models[name].interactionProperties[name].ElectricalConductance
```

Required arguments

None.

Optional arguments

definition
A SymbolicConstant specifying how the electrical conductance is defined. Possible values are TABULAR and USER_DEFINED. The default value is TABULAR.

Type
A SymbolicConstant specifying the Type of material. Possible values are SOLID and LIQUID. The default value is SOLID.

clearanceDependency
A Boolean specifying whether to use clearance-dependent data. The default value is ON.

pressureDependency
A Boolean specifying whether to use pressure-dependent data. The default value is OFF.

temperatureDependencyC
A Boolean specifying whether to use temperature-dependent data with clearance dependency. The default value is OFF.

ionConcentrationDependencyC
A Boolean specifying whether to use ion-concentration-dependent data with clearance dependency. The default value is OFF.

dependenciesC
An Int specifying the number of field variables to use with clearance dependency. The default value is 0.

clearanceDepTable
A sequence of sequences of Floats specifying clearance dependency data. The items in the table data are described below.

temperatureDependencyP
A Boolean specifying whether to use temperature-dependent data with pressure dependency. The default value is OFF.

ionConcentrationDependencyP A Boolean specifying whether to use ion-concentration–dependent data with pressure dependency. The default value is OFF.

dependenciesP An Int specifying the number of field variables to use with pressure dependency. The default value is 0.

pressureDepTable A sequence of sequences of Floats specifying pressure dependency data. The items in the table data are described below.

Table data

For *Type* = *SOLID* with The *clearanceDepTable* data specify the following:

- Conductivity.
- Clearance.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

For *Type* = *SOLID* with the *pressureDepTable* data specify the following:

- Conductivity.
- Pressure.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

For *Type* = *LIQUID* with The *clearanceDepTable* data specify the following:

- Conductivity.
- Clearance.
- Temperature, if the data depend on temperature.
- ion Concentration, if the data depend on ion Concentration.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

For *Type* = *LIQUID* with the *pressureDepTable* data specify the following:

- Conductivity.
- Pressure.
- Temperature, if the data depend on temperature.
- ion Concentration, if the data depend on ion Concentration.
- Value of the first field variable, if the data depend on field variables.

- Value of the second field variable.
- Etc.

Return value

A GapElectricalConductance object.

Exceptions

None.

`setValues(...)`

This method modifies the GapElectricalConductance object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *GapElectricalConductance* method.

Return value

`None.`

Exceptions

None.

Members

The GapElectricalConductance object has members with the same names and descriptions as the arguments to the *GapElectricalConductance* method.

Corresponding analysis keywords

GapHeatGeneration object

The GapHeatGeneration object specifies heat generation for a contact interaction property.

Access

```
import interaction
mdb.models[name].interactionProperties[name].heatGeneration
```

HeatGeneration(...)

This method creates a GapHeatGeneration object.

Path

```
mdb.models[name].interactionProperties[name].HeatGeneration
```

Required arguments

None.

Optional arguments

conversionFraction
A Float specifying the fraction of dissipated energy caused by friction or electric currents that is converted to heat. The default value is 1.0.

secondaryFraction
A Float specifying the fraction of converted heat distributed to the secondary surface. The default value is 0.5.

mechanicalInteractionFraction
A Float specifying the fraction of dissipated energy converted into heat generated by mechanical interaction.

mechanicalInteractionWeightingFactor
A Float specifying the weighting factor for the distribution of heat between the interacting surfaces generated by mechanical interaction.

electricalConductionSolidsFraction
A Float specifying the fraction of dissipated energy converted into heat generated by electrical conduction in the solids.

electricalConductionSolidsWeightingFactor
A Float specifying the weighting factor for the distribution of heat between the interacting surfaces generated by electrical conduction in the solids.

electricalConductionLiquidsFraction
A Float specifying the fraction of dissipated energy converted into heat generated by electrical conduction in the liquids.

electricalConductionLiquidsWeightingFactor
A Float specifying the weighting factor for the distribution of heat between the interacting surfaces generated by electrical conduction in the liquids.

Return value

A GapHeatGeneration object.

Exceptions

None.

setValues(...)

This method modifies the GapHeatGeneration object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *GapHeatGeneration* method.

Return value

`None.`

Exceptions

None.

Members

The GapHeatGeneration object has the following members:

conversionFraction

A Float specifying the fraction of dissipated energy caused by friction or electric currents that is converted to heat. The default value is 1.0.

secondaryFraction

A Float specifying the fraction of converted heat distributed to the secondary surface. The default value is 0.5.

mechanicalInteractionFraction

A Float specifying the fraction of dissipated energy converted into heat generated by mechanical interaction.

mechanicalInteractionWeightingFactor

A Float specifying the weighting factor for the distribution of heat between the interacting surfaces generated by mechanical interaction.

electricalConductionSolidsFraction

A Float specifying the fraction of dissipated energy converted into heat generated by electrical conduction in the solids.

electricalConductionSolidsWeightingFactor

A Float specifying the weighting factor for the distribution of heat between the interacting surfaces generated by electrical conduction in the solids.

electricalConductionLiquidsFraction

A Float specifying the fraction of dissipated energy converted into heat generated by electrical conduction in the liquids.

electricalConductionLiquidsWeightingFactor A Float specifying the weighting factor for the distribution of heat between the interacting surfaces generated by electrical conduction in the liquids.

Corresponding analysis keywords

- **GAP HEAT GENERATION*

GeometricProperties object

The GeometricProperties object specifies surface interaction properties.

Access

```
import interaction
mdb.models[name].interactionProperties[name].geometricProperties
```

GeometricProperties(...)

This method creates a GeometricProperties object.

Path

```
mdb.models[name].interactionProperties[name].GeometricProperties
```

Required arguments

None.

Optional arguments

contactArea

A Float specifying the out-of-plane thickness of the surface for a two-dimensional model or cross-sectional area for every node in the node-based surface. The default value is 1.0.

padThickness

`None` or a Float specifying the thickness of an interfacial layer between the contacting surfaces. If *padThickness*=`None`, there is no interfacial layer. The default value is `None`.

trackingThickness

`None` or a Float specifying the thickness that determines the contacting surfaces to be tracked. The input value for this parameter cannot be negative. An internal default value is used if a zero value is input or if the parameter is omitted.

dependentVariables

An Int specifying the number of state-dependent variables. The default value is 0. This argument is applicable only if *modelType*=MODELTYPE_USER or *modelType*=MODELTYPE_USER_INTERACTION.

numProperties

An Int specifying the number of property values required. The default value is 0. This argument is applicable only if *modelType*=MODELTYPE_USER or *modelType*=MODELTYPE_USER_INTERACTION.

useUnsymmetricEqunProcedure

A Boolean specifying whether to use unsymmetric equation solution procedures. This argument is applicable only if *modelType*=MODELTYPE_USER or *modelType*=MODELTYPE_USER_INTERACTION.

modelType

A SymbolicConstant specifying the surface interaction model type.

Return value

A GeometricProperties object.

Exceptions

None.

setValues(...)

This method modifies the GeometricProperties object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *GeometricProperties* method.

Return value

`None.`

Exceptions

None.

IncidentWave object

The IncidentWave object defines incident wave interactions for acoustic and coupled acoustic-structural analyses.

The IncidentWave object is derived from the *Interaction* object.

Access

```
import interaction
mdb.models[name].interactions[name]
```

IncidentWave(...)

This method creates an IncidentWave object.

Path

```
mdb.models[name].IncidentWave
```

Required arguments

name
A String specifying the repository key.

createStepName
A String specifying the name of the step in which the IncidentWave object is created.

sourcePoint
A *Region* object specifying the incident wave source point.

standoffPoint
A *Region* object specifying the incident wave standoff point.

This argument is not valid when *definition*=CONWEP.

surface
A *Region* object specifying the surface defining the incident wave interaction. In problems involving fluid/surface boundaries, both the fluid surface and the solid surface comprising the boundary must have an incident wave interaction specified.

interactionProperty
A String specifying the *IncidentWaveProperty* object associated with this interaction.

Optional arguments

definition
A SymbolicConstant specifying the type of incident wave to be defined. The value must be PRESSURE for linear perturbation steps. An Explicit step is required when the value is set to CONWEP. Possible values are PRESSURE, ACCELERATION, UNDEX, and CONWEP. The default value is PRESSURE.

amplitude
A String specifying the name of the *Amplitude* object that defines the fluid pressure time history at the standoff point, if *definition*=PRESSURE. If *definition*=ACCELERATION, then this string specifies the name of the *Amplitude* object that defines the fluid particle acceleration time history at the standoff point. This member can be specified only if *definition*=PRESSURE or ACCELERATION. The default value is an empty string.

imaginaryAmplitude A String specifying the name of the *Amplitude* object that defines the imaginary component of the fluid pressure time history at the standoff point. This member is applicable only for linear perturbation steps and if *definition*=PRESSURE. The default value is an empty string.

surfaceNormal A sequence of three Floats specifying the X, Y, and Z components of the direction cosine of the fluid surface normal.

This argument is valid only when *definition*=UNDEX.

initialDepth `None` or a Float specifying the initial depth of the UNDEX bubble. The default value is `None`.

This argument is valid only when *definition*=UNDEX.

referenceMagnitude A Float specifying the reference magnitude.

This argument is not valid when *definition*=CONWEP.

detonationTime A Float specifying the time of detonation, given in total time.

This argument is valid only when *definition*=CONWEP.

magnitudeFactor A Float specifying the magnitude scale factor. The default value is 1.0.

This argument is valid only when *definition*=CONWEP.

Return value

An IncidentWave object.

Exceptions

None.

`setValues(...)`

This method modifies the IncidentWave object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *IncidentWave* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

Members

The IncidentWave object has members with the same names and descriptions as the arguments to the *IncidentWave* method.

mdb.models[name].IncidentWaveProperty
```

Required arguments

name
A String specifying the interaction property repository key.

Optional arguments

definition
A SymbolicConstant specifying the type of wave to be defined. Possible values are PLANAR, SPHERICAL, DIFFUSE, AIR_BLAST, and SURFACE_BLAST. The default value is PLANAR.

propagationModel
A SymbolicConstant specifying the spherical propagation model. Possible values are ACOUSTIC, UNDEX_CHARGE, and GENERALIZED_DECAY. The default value is ACOUSTIC.

This argument is valid only when *definition*=SPHERICAL.

soundSpeed
A Float specifying the speed of sound in the fluid.

This argument is not valid when *definition*=AIR_BLAST or when *definition*=SURFACE_BLAST.

fluidDensity
A Float specifying the fluid mass density.

This argument is not valid when *definition*=AIR_BLAST or when *definition*=SURFACE_BLAST.

specificHeatRatio
`None` or a Float specifying the ratio of specific heats for gas. The default value is `None`.

This argument is valid only when *definition*=SPHERICAL and *propagationModel*=UNDEX_CHARGE.

gravity
`None` or a Float specifying the acceleration due to gravity. The default value is `None`.

This argument is valid only when *definition*=SPHERICAL and *propagationModel*=UNDEX_CHARGE.

atmosphericPressure

`None` or a Float specifying the atmospheric pressure. The default value is `None`.

This argument is valid only when *definition*=SPHERICAL and *propagationModel*=UNDEX_CHARGE.

dragCoefficient

`None` or a Float specifying the fluid drag coefficient. The default value is `None`.

This argument is valid only when *definition*=SPHERICAL and *propagationModel*=UNDEX_CHARGE.

dragExponent

A Float specifying the fluid drag exponent. The default value is 2.0.

This argument is valid only when *definition*=SPHERICAL and *propagationModel*=UNDEX_CHARGE.

waveEffects

A Boolean specifying whether or not to include wave effects in the fluid and gas. The default value is ON.

This argument is valid only when *definition*=SPHERICAL and *propagationModel*=UNDEX_CHARGE.

chargeDensity

`None` or a Float specifying the density of the charge material. The default value is `None`.

This argument is valid only when *definition*=SPHERICAL and *propagationModel*=UNDEX_CHARGE.

chargeMass

`None` or a Float specifying the mass of the charge material. The default value is `None`.

This argument is valid only when *definition*=SPHERICAL and *propagationModel*=UNDEX_CHARGE.

constantK1

`None` or a Float specifying the charge material constant K. The default value is `None`.

This argument is valid only when *definition*=SPHERICAL and *propagationModel*=UNDEX_CHARGE.

constantK2

`None` or a Float specifying the charge material constant k. The default value is `None`.

This argument is valid only when *definition*=SPHERICAL and *propagationModel*=UNDEX_CHARGE.

constantA

`None` or a Float specifying the charge material constant A. The default value is `None`.

This argument is valid only when *definition*=SPHERICAL and *propagationModel*=UNDEX_CHARGE.

constantB

`None` or a Float specifying the charge material constant B. The default value is `None`.

This argument is valid only when *definition*=SPHERICAL and *propagationModel*=UNDEX_CHARGE.

constantKc

`None` or a Float specifying the charge material constant Kc. The default value is `None`.

This argument is valid only when *definition*=SPHERICAL and *propagationModel*=UNDEX_CHARGE.

duration

`None` or a Float specifying the time duration for the bubble simulation. The default value is `None`.

This argument is valid only when *definition*=SPHERICAL and *propagationModel*=UNDEX_CHARGE.

maximumSteps

An Int specifying the maximum number of time steps for the bubble simulation. The default value is 1500.

This argument is valid only when *definition*=SPHERICAL and *propagationModel*=UNDEX_CHARGE.

relativeStepControl

A Float specifying the relative step size control parameter. The default value is 1×10^{-11}.

This argument is valid only when *definition*=SPHERICAL and *propagationModel*=UNDEX_CHARGE.

absoluteStepControl

A Float specifying the absolute step size control parameter. The default value is 1×10^{-11}.

This argument is valid only when *definition*=SPHERICAL and *propagationModel*=UNDEX_CHARGE.

stepControlExponent

A Float specifying the step size control exponent. The default value is 0.2.

This argument is valid only when *definition*=SPHERICAL and *propagationModel*=UNDEX_CHARGE.

genDecayA

A Float specifying the constant A associated with the generalized decay propagation model. The default value is 0.0.

This argument is valid only when *definition*=SPHERICAL and *propagationModel*=GENERALIZED_DECAY.

genDecayB

A Float specifying the constant B associated with the generalized decay propagation model. The default value is 0.0.

This argument is valid only when *definition*=SPHERICAL and *propagationModel*=GENERALIZED_DECAY.

genDecayC

A Float specifying the constant C associated with the generalized decay propagation model. The default value is 0.0.

This argument is valid only when *definition*=SPHERICAL and *propagationModel*=GENERALIZED_DECAY.

seedNumber

An Int specifying the seed number (N) for the diffuse source calculation. N^2 sources will be used in the simulation.

This argument is valid only when *definition*=DIFFUSE.

massTNT

A Float specifying the equivalent mass of TNT, in any preferred mass unit.

This argument is valid only when *definition*=AIR_BLAST or *definition*=SURFACE_BLAST.

massFactor

A Float specifying the multiplication factor to convert from the preferred mass unit to kilograms. The default value is 1.0.

This argument is valid only when *definition*=AIR_BLAST or *definition*=SURFACE_BLAST.

lengthFactor

A Float specifying the multiplication factor to convert from the analysis length unit to meters. The default value is 1.0.

This argument is valid only when *definition*=AIR_BLAST or *definition*=SURFACE_BLAST.

timeFactor

A Float specifying the multiplication factor to convert from the analysis time unit to seconds. The default value is 1.0.

This argument is valid only when *definition*=AIR_BLAST or *definition*=SURFACE_BLAST.

pressureFactor

A Float specifying the multiplication factor to convert from the analysis pressure unit to pascals. The default value is 1.0.

This argument is valid only when *definition*=AIR_BLAST or *definition*=SURFACE_BLAST.

Return value

An IncidentWaveProperty object.

Exceptions

None.

`setValues(...)`

This method modifies the IncidentWaveProperty object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *IncidentWaveProperty* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The IncidentWaveProperty object has members with the same names and descriptions as the arguments to the *IncidentWaveProperty* method.

Corresponding analysis keywords

- **INCIDENT WAVE INTERACTION PROPERTY*
- **UNDEX CHARGE PROPERTY*
- **CONWEP CHARGE PROPERTY*

IncidentWaveState object

The IncidentWaveState object stores the propagating data of an *IncidentWave* object in a step. One instance of this object is created internally by the *IncidentWave* object for each step. The instance is also deleted internally by the *IncidentWave* object.

The IncidentWaveState object has no constructor or methods.

The IncidentWaveState object is derived from the *InteractionState* object.

Access

```
import interaction
mdb.models[name].steps[name].interactionStates[name]
```

Members

The IncidentWaveState object has the following member:

status

A SymbolicConstant specifying the propagation state of the *InteractionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

Corresponding analysis keywords

- **INCIDENT WAVE INTERACTION*

InitializationAssignment object

The InitializationAssignment object stores the contact initialization assignment definition for domain pairs in a *ContactStd* or *ContactExp* object. The InitializationAssignment object has no constructor or members.

Access

```
import interaction
mdb.models[name].interactions[name].initializationAssignments
```

changeValuesInStep(...)

This method allows modification of contact initialization assignments to domain pairs already defined in a given step.

Required arguments

stepName A String specifying the name of the step in which the contact initialization assignments are to be modified.

index An Int specifying the position of the contact initialization assignment whose value is to be modified.

value A String specifying the value of the contact initialization to be assigned to the domain pair whose index is referenced.

Optional arguments

None.

Return value

None.

Exceptions

None.

appendInStep(...)

This method allows addition of contact initialization assignments to new domain pairs in a given step.

Required arguments

stepName A String specifying the name of the step in which new contact initialization assignments are to be defined.

assignments A sequence of tuples specifying the initializations assigned to each surface pair. Each tuple contains four entries (fourth entry is for Abaqus/Explicit and is optional):

- A region object or the SymbolicConstant GLOBAL (for Abaqus/Standard only).
- A region object or the SymbolicConstant SELF (for Abaqus/Standard only).

- A String specifying a *StdInitialization* or *ExpInitialization*object associated with this pair of regions.
- A String specifying a secondary surface type. This entry is applicable only if the *ExpInitialization* object is defined with *overclosureType*=CLEARANCE and *adjustNodalCoords*=True.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`delete(...)`

The `delete` method allows you to delete existing contact initialization assignments from a *ContactStd* or *ContactExp* object.

Required arguments

indices A sequence of Ints specifying the index of each contact initialization assignment to delete.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

Members

The InitializationAssignment object has no members.

Corresponding analysis keywords

- **CONTACT INITIALIZATION ASSIGNMENT*

InteractionProperty object

The InteractionProperty object is the abstract base type for other InteractionProperty objects. The InteractionProperty object has no explicit constructor, members, or methods.

Access

```
import interaction
mdb.models[name].interactionProperties[name]
```

Members

The InteractionProperty object has no members.

InteractionState object

The InteractionState object is the abstract base type for other InteractionState objects. The InteractionState object has no explicit constructor. The members of the InteractionState object are common to all objects derived from InteractionState.

Access

```
import interaction
mdb.models[name].steps[name].interactionStates[name]
```

Members

The InteractionState object has the following member:

status

A SymbolicConstant specifying the propagation state of the InteractionState object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

MainSecondaryAssignment object

The MainSecondaryAssignment object stores the main-secondary assignment definition for surfaces in *ContactExp* and *ContactStd* objects. The MainSecondaryAssignment object has no constructor or members.

Access

```
import interaction
mdb.models[name].interactions[name].mainSecondaryAssignments
```

changeValuesInStep(...)

This method allows modification of main-secondary assignments already defined on surface pairs in a given step.

Required arguments

stepName A String specifying the name of the step in which the main-secondary assignments are to be modified.

index An Int specifying the position of the main-secondary assignment whose value is to be modified.

value A SymbolicConstant specifying the value of the main-secondary role to be assigned to the surface whose index is referenced. Possible values are MAIN, SECONDARY, and BALANCED. The SymbolicConstant BALANCED can be specified only in an Abaqus/Standard analysis.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

appendInStep(...)

This method allows addition of main-secondary assignments to new surface pairs in a given step.

Required arguments

stepName A String specifying the name of the step in which the main-secondary assignments are to be defined.

assignments A sequence of tuples specifying the main-secondary assignments. Each tuple contains two entries:

- A region object or the SymbolicConstant GLOBAL specifying the surface to which the main-secondary attribute is assigned.

- A SymbolicConstant specifying the overriding main-secondary value to be used for the first surface. Possible values of the SymbolicConstant are MAIN, SECONDARY, and BALANCED. The SymbolicConstant BALANCED can be specified only in an Abaqus/Standard analysis.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`delete(...)`

The `delete` method allows you to delete existing main-secondary assignments.

Required arguments

indices A sequence of Ints specifying the index of each main-secondary assignment to delete.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

Members

The MainSecondaryAssignment object has no members.

Corresponding analysis keywords

- **CONTACT FORMULATION*, TYPE=PURE MAIN-SECONDARY
- **CONTACT FORMULATION*, TYPE=MAIN SECONDARY ROLES

Model object

The following commands operate on Model objects. For more information about the Model object, see *Model object*.

Access

```
import interaction
```

`contactDetection(...)`

This method uses contact detection to create *SurfaceToSurfaceContactStd*, *SurfaceToSurfaceContactExp*, and *Tie* objects.

Required arguments

None.

Optional arguments

name

A String specifying the prefix used to generate repository keys. The default value is "CP-"

createStepName

A String specifying the name of the step in which the *SurfaceToSurfaceContactStd*, *SurfaceToSurfaceContactExp*, and *Tie* objects are created. The default value is "Initial."

searchDomain

A SymbolicConstant MODEL or a sequence of Strings specifying the names of instances to search. MODEL indicates the whole model is searched. The default value is MODEL.

defaultType

A SymbolicConstant specifying the default type of object to create. Possible values are CONTACT, CONTACT_STANDARD, CONTACT_EXPLICIT, and TIE. If CONTACT is used, the behavior is determined by the type of *Step* in the model. If an *ExplicitDynamicsStep* or *TempDisplacementDynamicsStep* exists, then *SurfaceToSurfaceContactExp* is created by default. Otherwise *SurfaceToSurfaceContactStd* is created by default. The default value is CONTACT.

interactionProperty

A String specifying the name of the *ContactProperty* object associated with any interactions created.

separationTolerance

A Float specifying the maximum separation for considering two surfaces to be candidates for contact, where separation is the maximum distance between the points of closest approach on the two surfaces. The default value is a function of the model.

extendByAngle

None or a Float specifying the angle for extending surface definitions to include adjacent faces. The default value is 20.

mergeWithinAngle
None or a Float specifying the angle for merging adjacent contact pairs that lie within the angle. The default value is 20.

searchSingleInstances
A Boolean specifying whether to include surface pairs within a single instance. The default value is OFF.

nameEachSurfaceFound
A Boolean specifying whether to assign a name to each surface found. The default value is ON.

createUnionOfMainSurfaces
A Boolean specifying whether to create a surface that is the union of all main surfaces found. The default value is OFF.

createUnionOfSecondarySurfaces
A Boolean specifying whether to create a surface that is the union of all secondary surfaces found. The default value is OFF.

createUnionOfMainSecondarySurfaces
A Boolean specifying whether to create a surface that is the union of all main and secondary surfaces found. The default value is OFF.

includePlanar
A Boolean specifying whether to include planar geometry. The default value is ON.

includeCylindricalSphericalToric
A Boolean specifying whether to include cylindrical, spherical, and toric geometry. The default value is ON.

includeSplineBased
A Boolean specifying whether to include spline-based geometry. The default value is ON.

includeMeshSolid
A Boolean specifying whether to include solid mesh entities. The default value is ON.

includeMeshShell
A Boolean specifying whether to include shell mesh entities. The default value is ON.

includeMeshMembrane
A Boolean specifying whether to include mesh membrane entities. The default value is OFF.

includeOverclosed
A Boolean specifying whether to include overclosed pairs. The default value is ON.

includeNonOverlapping
A Boolean specifying whether to include opposing geometry surfaces that do not overlap. The default value is OFF.

meshedGeometrySearchTechnique
A SymbolicConstant USE_GEOMETRY or USE_MESH specifying whether to locate pairs in meshed geometry using the geometric entities or mesh entities. The default value is USE_GEOMETRY.

useShellThickness
A Boolean specifying whether to account for shell thickness and offset during contact detection. The default value is ON.

surfaceSmoothing A SymbolicConstant specifying whether to use surface smoothing for geometric surfaces in *SurfaceToSurfaceContactStd* interactions. Possible values are NONE and AUTOMATIC. The default value isAUTOMATIC.

Return value

None

Exceptions

None.

`getSurfaceSeparation(...)`

This method returns a list of all possible contacts that can be created using the *ContactDetection* method.

Required arguments

None.

Optional arguments

The optional arguments to `getSurfaceSeparation` are the same as the arguments to the *ContactDetection* method, with the exception of the *createStepName*, *defaultType*, *interactionProperty*, and *nameEachSurfaceFound* arguments.

Return value

Tuple of tuples, where each tuple holds information, to be used in contact creation as follows:

A string specifying the name of the main surface used in contact.

A string specifying the name of the secondary surface used in contact.

A float specifying the separation distance between the main surface and the secondary surface.

A boolean specifying whether or not contact surfaces are overclosed.

Exceptions

None.

ModelChange object

The ModelChange object defines model change interactions for element removal and reactivation.

The ModelChange object is derived from the *Interaction* object.

Access

```
import interaction
mdb.models[name].interactions[name]
```

ModelChange(...)

This method creates a ModelChange object.

Path

```
mdb.models[name].ModelChange
```

Required arguments

name
A String specifying the repository key.

createStepName
A String specifying the name of the step in which the ModelChange object is created.

Optional arguments

isRestart
A Boolean specifying whether this interaction is being used solely to indicate that model change may be required in a subsequent restart analysis (either for elements or contact pairs). The default value is OFF.

regionType
A SymbolicConstant specifying the region selection type. This argument is valid only when *isRestart*=False. Possible values are GEOMETRY, SKINS, STRINGERS, and ELEMENTS. The default value is GEOMETRY.

region
A *Region* object specifying the elements to be removed or reactivated. This argument is valid only when *isRestart*=False.

activeInStep
A Boolean specifying whether elements are being removed or reactivated. This argument is valid only when *isRestart*=False. The default value is OFF.

includeStrain
A Boolean specifying whether stress/displacement elements are reactivated with strain. This argument is valid only when *isRestart*=False and when *activeInStep*=True. The default value is OFF.

Return value

A ModelChange object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing ModelChange object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ModelChange* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data of an existing ModelChange object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the interaction is modified.

Optional arguments

activeInStep A Boolean specifying whether elements are being removed or reactivated. This argument is valid only when *isRestart*=False. The default value is OFF.

includeStrain A Boolean specifying whether stress/displacement elements are reactivated with strain. This argument is valid only when *isRestart*=False and when *activeInStep*=True. The default value is OFF.

Return value

`None.`

Exceptions

None.

Members

The ModelChange object has members with the same names and descriptions as the arguments to the *ModelChange* method.

Corresponding analysis keywords

- **MODEL CHANGE*, TYPE=ELEMENT
- **MODEL CHANGE*, ACTIVATE

NormalBehavior object

The NormalBehavior object specifies normal behavior for a contact interaction property.

Access

```
import interaction
mdb.models[name].interactionProperties[name].normalBehavior
```

NormalBehavior(...)

This method creates a NormalBehavior object.

Path

```
mdb.models[name].interactionProperties[name].NormalBehavior
```

Required arguments

None.

Optional arguments

contactStiffness

The SymbolicConstant DEFAULT or a Float specifying the contact stiffness. This argument is valid for *pressureOverclosure*=LINEAR. This argument is also valid for *pressureOverclosure*=HARD when *constraintEnforcementMethod*=AUGMENTED_LAGRANGE or PENALTY. A value of DEFAULT is valid only when the later conditions are met. A value of zero is equivalent to specifying DEFAULT. The default value is DEFAULT.

pressureOverclosure

A SymbolicConstant specifying the pressure-overclosure relationship to be used. Possible values are HARD, EXPONENTIAL, LINEAR, TABULAR, and SCALE_FACTOR. The default value is HARD.

allowSeparation

A Boolean specifying whether to allow separation after contact. The default value is ON.

maxStiffness

`None` or a Float specifying the maximum stiffness. If *maxStiffness*=`None`, there is no upper limit. The default value is `None`.

table

A sequence of sequences of Floats specifying the normal behavior properties. This argument is valid only for *pressureOverclosure*=EXPONENTIAL or TABULAR. The items in the table data are described below.

constraintEnforcementMethod

A SymbolicConstant specifying the method for enforcement of the contact constraint. Possible values are DEFAULT, AUGMENTED_LAGRANGE, PENALTY, and DIRECT. The default value is DEFAULT.

overclosureFactor

A Float specifying the overclosure measure (used to delineate the segments of the pressure-overclosure curve) as a percentage of the minimum element size in the contact region. The default value is 0.0.

overclosureMeasure
A Float specifying the overclosure measure (used to delineate the segments of the pressure-overclosure curve) directly. The default value is 0.0.

contactStiffnessScaleFactor
A Float specifying scale factor for the penalty stiffness or the geometric scaling of the "base" stiffness. The default value is 1.0.

initialStiffnessScaleFactor
A Float specifying an additional scale factor for the "base" default contact stiffness. The default value is 1.0.

clearanceAtZeroContactPressure
A Float specifying the clearance at which the contact pressure is zero. The default value is 0.0.

stiffnessBehavior
A SymbolicConstant specifying the type of penalty stiffness to be defined. This argument is valid only when *constraintEnforcementMethod*=PENALTY. Possible values are LINEAR and NONLINEAR. The default value is LINEAR.

stiffnessRatio
A Float specifying the ratio of the initial stiffness divided by the final stiffness. This argument is valid only when *stiffnessBehavior*=NONLINEAR. Possible values are $0 \leq stiffnessRatio < 1$. The default value is 0.01.

upperQuadraticFactor
A Float specifying the ratio of the overclosure at the maximum stiffness divided by the characteristic facet length. This argument is valid only when *stiffnessBehavior*=NONLINEAR. The default value is 0.03.

lowerQuadraticRatio
A Float specifying the ratio of the overclosure at the initial stiffness divided by the overclosure at the maximum stiffness, both relative to the clearance at which the contact pressure is zero. This argument is valid only when *stiffnessBehavior*=NONLINEAR. Possible values are $0 \leq stiffnessRatio < 1$. The default value is 0.33333.

Table data

If *pressureOverclosure*=EXPONENTIAL, the table data specify the following:

- Pressure at zero clearance, p_0.
- Clearance at which the contact pressure is zero, c_0.

If *pressureOverclosure*=TABULAR, the table data specify the following:

- Pressure.
- Overclosure.

Return value

A NormalBehavior object.

Exceptions

None.

`setValues(...)`

This method modifies the NormalBehavior object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *NormalBehavior* method.

Return value

`None.`

Exceptions

None.

Members

The NormalBehavior object has members with the same names and descriptions as the arguments to the *NormalBehavior* method.

Corresponding analysis keywords

- **SURFACE BEHAVIOR*

PolarityAssignments object

The PolarityAssignments object stores the polarity assignment definition for surfaces in *ContactExp* objects. The PolarityAssignments object has no constructor or members.

Access

```
import interaction
mdb.models[name].interactions[name].polarityAssignments
```

changeValuesInStep(...)

This method allows you to modify polarity assignments already defined on surface pairs in a given step.

Required arguments

stepName A String specifying the name of the step in which the main-secondary assignments are to be modified.

index An Int specifying the position of the polarity assignment whose value is to be modified.

value A SymbolicConstant specifying the value of the polarity to be assigned to the surface whose index is referenced. Possible values are SPOS, SNEG, and TWO_SIDED.

Optional arguments

None.

Return value

None.

Exceptions

None.

appendInStep(...)

This method allows you to add polarity assignments to new surface pairs in a given step.

Required arguments

stepName A String specifying the name of the step in which the polarity assignments are to be defined.

assignments A sequence of tuples specifying the polarity assignments. Each tuple contains two entries:

- A region object or the SymbolicConstant GLOBAL specifying the surface to which the polarity attribute is assigned.
- A SymbolicConstant specifying the overriding polarity value to be used for the first surface. Possible values of the SymbolicConstant are SPOS, SNEG, and TWO_SIDED.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`delete(...)`

The `delete` method allows you to delete existing polarity assignments.

Required arguments

indices A sequence of Ints specifying the index of each polarity assignment to delete.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

Members

The PolarityAssignments object has no members.

Corresponding analysis keywords

- **CONTACT FORMULATION*, TYPE=POLARITY

PressurePenetration object

The PressurePenetration object defines pressure penetration loading simulated with surface-to-surface contact.

The PressurePenetration object is derived from the *Interaction* object.

Access

```
import interaction
mdb.models[name].interactions[name]
```

PressurePenetration(...)

This method creates a PressurePenetration object.

Path

```
mdb.models[name].PressurePenetration
```

Required arguments

name
A String specifying the repository key.

createStepName
A String specifying the name of the step in which the PressurePenetration object is created.

contactInteraction
A String specifying the name of the Surface-to-surface contact (Standard) interaction.

mainPoints
A *RegionArray* object specifying the points on the main surface that are exposed to the fluid.

secondaryPoints
A *RegionArray* object specifying the points on the secondary surface that are exposed to the fluid.

penetrationPressure
A tuple of Floats specifying the fluid pressure magnitude. For steady state dynamic analyses, a tuple of Complexes specifying the fluid pressure magnitude.

criticalPressure
A tuple of Floats specifying the critical contact pressure below which fluid penetration starts to occur.

Optional arguments

amplitude
A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

penetrationTime
A Float specifying the fraction of the current step time over which the fluid pressure on newly penetrated contact surface segments is ramped up to the current magnitude. The default value is 0.001.

Return value

A PressurePenetration object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing PressurePenetration object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *PressurePenetration* method, except for the *name* and *createStepName* arguments.

Return value

```
None.
```

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing PressurePenetration object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the interaction is modified.

Optional arguments

penetrationPressure A tuple of Floats specifying the fluid pressure magnitude. For steady state dynamic analyses, a tuple of Complexes specifying the fluid pressure magnitude.

criticalPressure A tuple of Floats specifying the critical contact pressure below which fluid penetration starts to occur.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the load is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

penetrationTime A Float specifying the fraction of the current step time over which the fluid pressure on newly penetrated contact surface segments is ramped up to the current magnitude. The default value is 0.001.

Return value

`None.`

Exceptions

None.

Members

The PressurePenetration object has the following members:

name A String specifying the repository key.

createStepName A String specifying the name of the step in which the PressurePenetration object is created.

contactInteraction A String specifying the name of the Surface-to-surface contact (Standard) interaction.

mainPoints A *RegionArray* object specifying the points on the main surface that are exposed to the fluid.

secondaryPoints A *RegionArray* object specifying the points on the secondary surface that are exposed to the fluid.

Corresponding analysis keywords

- **PRESSURE PENETRATION*

PressurePenetrationState object

The PressurePenetrationState object stores the propagating data of a *PressurePenetration* object in a step. One instance of this object is created internally by the *PressurePenetration* object for each step. The instance is also deleted internally by the *PressurePenetration* object.

The PressurePenetrationState object has no constructor or methods.

The PressurePenetrationState object is derived from the *InteractionState* object.

Access

```
import interaction
mdb.models[name].steps[name].interactionStates[name]
```

Members

The PressurePenetrationState object has the following members:

penetrationTime

A Float specifying the fraction of the current step time over which the fluid pressure on newly penetrated contact surface segments is ramped up to the current magnitude. The default value is 10^{-3}.

penetrationTimeState

A SymbolicConstant specifying the propagation state of the *penetrationTime* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

criticalPressureState

A SymbolicConstant specifying the propagation state of the *criticalPressure* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

penetrationPressureState

A SymbolicConstant specifying the propagation state of the *penetrationPressure* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

penetrationPressure

A tuple of Floats specifying the fluid pressure magnitude. For steady state dynamic analyses, a tuple of Complexes specifying the fluid pressure magnitude.

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

criticalPressure

A tuple of Floats specifying the critical contact pressure below which fluid penetration starts to occur.

status

A SymbolicConstant specifying the propagation state of the *InteractionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED

- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

Corresponding analysis keywords

- **PRESSURE PENETRATION*

Radiation object

The Radiation object specifies radiation for a contact interaction property.

Access

```
import interaction
mdb.models[name].interactionProperties[name].radiation
```

Radiation(...)

This method creates a Radiation object.

Path

```
mdb.models[name].interactionProperties[name].Radiation
```

Required arguments

mainEmissivity

A Float specifying the emissivity of the main surface.

secondaryEmissivity

A Float specifying the emissivity of the secondary surface.

table

A sequence of sequences of Floats specifying the following:

- Effective viewfactor, F.
- Gap clearance, d.

Optional arguments

None.

Return value

A Radiation object.

Exceptions

None.

`setValues(...)`

This method modifies the Radiation object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Radiation* method.

Return value

`None.`

Exceptions

None.

Members

The Radiation object has members with the same names and descriptions as the arguments to the *Radiation* method.

Corresponding analysis keywords

- **GAP RADIATION*

RadiationToAmbient object

The RadiationToAmbient object defines radiant heat transfer between a surface and its environment.

The RadiationToAmbient object is derived from the *Interaction* object.

Access

```
import interaction
mdb.models[name].interactions[name]
```

RadiationToAmbient(...)

This method creates a RadiationToAmbient object.

Path

```
mdb.models[name].RadiationToAmbient
```

Required arguments

name
A String specifying the repository key.

createStepName
A String specifying the name of the step in which the RadiationToAmbient object is created.

region
A *Region* object specifying the surface to which the radiation interaction is applied or an Element set object specifying the elements to which the element-based radiation interaction is applied.

emissivity
A Float specifying the emissivity, ϵ.

Optional arguments

field
A String specifying the name of the *AnalyticalField* object associated with this interaction. The *field* argument applies only when *distributionType*=ANALYTICAL_FIELD. The default value is an empty string.

distributionType
A SymbolicConstant specifying how the radiation is distributed. This argument applies only when *radiationType*=AMBIENT. Possible values are UNIFORM and ANALYTICAL_FIELD. The default value is UNIFORM.

radiationType
A SymbolicConstant specifying whether to use the default surface radiation behavior, or the cavity radiation approximation. Possible values are AMBIENT and CAVITY. The default value is AMBIENT.

ambientTemperature
A Float specifying the reference ambient temperature, θ^0. This argument applies only when *radiationType*=AMBIENT. The default value is 0.0.

ambientTemperatureAmp A String specifying the name of the *Amplitude* object that gives the variation of the ambient temperature with time.

Note: Use `None` in an Abaqus/Standard analysis to specify that the reference ambient temperature is applied immediately at the beginning of the step or linearly over the step. Use `None` in an Abaqus/Explicit analysis to specify that the reference ambient temperature is applied throughout the step. This argument applies only when *radiationType*=AMBIENT.

dynamicSurfaceActivation A Boolean specifying the activation of element-based radiation interaction on evolving faces of an element.

Return value

A RadiationToAmbient object.

Exceptions

None.

`setValues(...)`

This method modifies the data for an existing RadiationToAmbient object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *RadiationToAmbient* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data of an existing RadiationToAmbient object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the interaction is modified.

Optional arguments

The optional arguments to `setValuesInStep` are *emissivity*, *ambientTemperature*, and *ambientTemperatureAmp* arguments.

Return value

`None.`

Exceptions

None.

Members

The RadiationToAmbient object has members with the same names and descriptions as the arguments to the *RadiationToAmbient* method except the optional arguments to the *setValuesInStep* method.

RadiationToAmbientState object

The RadiationToAmbientState object stores the propagating data for a *RadiationToAmbient* object. One instance of this object is created internally by the *RadiationToAmbient* object for each step. The instance is also deleted internally by the *RadiationToAmbient* object.

The RadiationToAmbientState object has no constructor or methods.

The RadiationToAmbientState object is derived from the *InteractionState* object.

Access

```
import interaction
mdb.models[name].steps[name].interactionStates[name]
```

Members

The RadiationToAmbientState object has the following members:

ambientTemperature

A Float specifying the ambient temperature.

ambientTemperatureState

A SymbolicConstant specifying the propagation state of the *ambientTemperature* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

ambientTemperatureAmpState

A SymbolicConstant specifying the propagation state of the *ambientTemperatureAmp* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

emissivity

A Float specifying the emissivity.

emissivityState

A SymbolicConstant specifying the propagation state of the *emissivity* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

ambientTemperatureAmp

A String specifying the name of the Amplitude object that gives the variation of the ambient temperature with time.

status

A SymbolicConstant specifying the propagation state of the *InteractionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

Corresponding analysis keywords

- **SRADIATE*

RegionPairs object

The RegionPairs object stores the domain pair definition for *ContactExp* and *ContactStd* objects. The RegionPairs object has no constructor or members.

Access

```
import interaction
mdb.models[name].interactions[name].excludedPairs
mdb.models[name].interactions[name].includedPairs
```

setValuesInStep(...)

This method allows addition and removal of domain pairs in a given step.

Required arguments

stepName A String specifying the name of the step in which the region pair assignments are to be modified.

Optional arguments

useAllstar A Boolean specifying whether the contacting surface pair consists of all exterior faces and -- in an Abaqus/Explicit analysis -- analytical rigid surfaces, shell edges, and beam segments in the model.

addPairs A sequence of pairs of region objects or SymbolicConstants that specify the surface pairs to add to the included pairs of the *ContactExp* or *ContactStd* object in the given step. Possible values of the SymbolicConstants are GLOBAL and SELF. When used with a *ContactExp* object, the second parameter of each pair can also be a string that references an Eulerian material surface.

removePairs A sequence of pairs of region objects or SymbolicConstants that specify the surface pairs to remove from the included pairs of the *ContactExp* or *ContactStd* object in the given step. Possible values of the SymbolicConstants are GLOBAL and SELF. When used with a *ContactExp* object, the second parameter of each pair can also be a string that references an Eulerian material surface.

Return value

`None.`

Exceptions

None.

Members

The RegionPairs object has no members.

Corresponding analysis keywords

- **CONTACT INCLUSIONS*
- **CONTACT EXCLUSIONS*

SelfContactExp object

The SelfContactExp object defines self-contact during an Abaqus/Explicit analysis.

The SelfContactExp object is derived from the *Interaction* object.

Access

```
import interaction
mdb.models[name].interactions[name]
```

SelfContactExp(...)

This method creates a SelfContactExp object.

Path

```
mdb.models[name].SelfContactExp
```

Required arguments

name	A String specifying the repository key.
createStepName	A String specifying the name of the step in which the SelfContactExp object is created.
surface	A *Region* object specifying the surface where self-contact is defined.
interactionProperty	A String specifying the name of the *ContactProperty* object associated with this interaction.

Optional arguments

mechanicalConstraint	A SymbolicConstant specifying the mechanical constraint formulation. Possible values are KINEMATIC and PENALTY. The default value is KINEMATIC.
contactControls	A String specifying the name of the *ContactControl* object associated with this interaction. An empty string indicates that the default contact controls will be used. The default value is an empty string.

Return value

A SelfContactExp object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing SelfContactExp object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *SelfContactExp* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing SelfContactExp object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the interaction is modified.

Optional arguments

interactionProperty A String specifying the name of the *ContactProperty* object associated with this interaction.

contactControls A String specifying the name of the *ContactControl* object associated with this interaction. An empty string indicates that the default contact controls will be used. The default value is an empty string.

Return value

`None.`

Exceptions

None.

Members

The SelfContactExp object has members with the same names and descriptions as the arguments to the *SelfContactExp* method except the optional arguments to the *setValuesInStep* method.

SelfContactExpState object

The SelfContactExpState object stores the propagating data for a *SelfContactExp* object. One instance of this object is created internally by the *SelfContactExp* object for each step. The instance is also deleted internally by the *SelfContactExp* object.

The SelfContactExpState object has no constructor or methods.

The SelfContactExpState object is derived from the *InteractionState* object.

Access

```
import interaction
mdb.models[name].steps[name].interactionStates[name]
```

Members

The SelfContactExpState object has the following members:

interactionPropertyState

A SymbolicConstant specifying the propagation state of the *interactionProperty* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

contactControlsState

A SymbolicConstant specifying the propagation state of the *contactControls* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

interactionProperty

A String specifying the name of the *ContactProperty* object associated with this interaction.

contactControls

A String specifying the name of the *ContactControl* object associated with this interaction.

status

A SymbolicConstant specifying the propagation state of the *InteractionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

Corresponding analysis keywords

- **CONTACT CONTROLS*
- **CONTACT PAIR*

- **MODEL CHANGE*, TYPE=CONTACT PAIR

SelfContactStd object

The SelfContactStd object defines self-contact during an Abaqus/Standard analysis.

The SelfContactStd object is derived from the *Interaction* object.

Access

```
import interaction
mdb.models[name].interactions[name]
```

SelfContactStd(...)

This method creates a SelfContactStd object.

Path

```
mdb.models[name].SelfContactStd
```

Required arguments

name
A String specifying the repository key.

createStepName
A String specifying the name of the step in which the SelfContactStd object is created.

surface
A *Region* object specifying the surface where self-contact is defined.

interactionProperty
A String specifying the name of the *ContactProperty* object associated with this interaction.

Optional arguments

enforcement
A SymbolicConstant specifying the discretization method. Possible values are NODE_TO_SURFACE and SURFACE_TO_SURFACE. The default value is SURFACE_TO_SURFACE.

thickness
A Boolean specifying whether shell/membrane element thickness is considered. The default value is ON.

This argument in valid only when *enforcement*=SURFACE_TO_SURFACE.

smooth
A Float specifying the degree of smoothing used for deformable or rigid main surfaces involved when *enforcement*=NODE_TO_SURFACE. The value given must lie between 0.0 and 0.5. The default value is 0.2.

contactControls
A String specifying the name of the *ContactControl* object associated with this interaction. An empty string indicates that the default contact controls will be used. The default value is an empty string.

Return value

A SelfContactStd object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing SelfContactStd object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *SelfContactStd* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data of an existing SelfContactStd object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the interaction is modified.

Optional arguments

interactionProperty A String specifying the name of the *ContactProperty* object associated with this interaction.

contactControls A String specifying the name of the *ContactControl* object associated with this interaction. An empty string indicates that the default contact controls will be used. The default value is an empty string.

Return value

`None.`

Exceptions

None.

Members

The SelfContactStd object has members with the same names and descriptions as the arguments to the *SelfContactStd* method except the optional arguments to the *setValuesInStep* method.

In addition, the SelfContactStd object has the following members:

contactTracking

A SymbolicConstant specifying the choice of contact tracking algorithm. The STATE tracking algorithm uses only normal projections and is specified by using ONE_CONFIG. The PATH tracking algorithm uses crossing and normal projections and is specified by using TWO_CONFIG. Possible values are ONE_CONFIG and TWO_CONFIG. The default value is TWO_CONFIG.

This argument is valid only when *enforcement*=SURFACE_TO_SURFACE.

supplementaryContact

A SymbolicConstant specifying the manner in which mid-face constraints are employed. Possible values are SELECTIVE, NEVER, and ALWAYS. The default value is SELECTIVE.

This argument is valid only when *enforcement*=NODE_TO_SURFACE.

SelfContactStdState object

The SelfContactStdState object stores the propagating data for a *SelfContactStd* object. One instance of this object is created internally by the *SelfContactStd* object for each step. The instance is also deleted internally by the *SelfContactStd* object.

The SelfContactStdState object has no constructor or methods.

The SelfContactStdState object is derived from the *InteractionState* object.

Access

```
import interaction
mdb.models[name].steps[name].interactionStates[name]
```

Members

The SelfContactStdState object has the following members:

interactionPropertyState

A SymbolicConstant specifying the propagation state of the *interactionProperty* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

contactControlsState

A SymbolicConstant specifying the propagation state of the *contactControls* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

interactionProperty

A String specifying the *ContactProperty* object associated with this interaction.

contactControls

A String specifying the name of the *ContactControl* object associated with this interaction.

status

A SymbolicConstant specifying the propagation state of the *InteractionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

SlidingFormulationAssignment object

The SlidingFormulationAssignment object stores the sliding formulation assignment definition for surfaces in *ContactStd* objects. The SlidingFormulationAssignment object has no constructor or members.

Access

```
import interaction
mdb.models[name].interactions[name].slidingFormulationAssignments
```

changeValuesInStep(...)

This method allows you to modify sliding formulation assignments already defined on surface pairs in a given step.

Required arguments

stepName A String specifying the name of the step in which the sliding formulation assignments are to be modified.

index An Int specifying the position of the sliding formulation assignment whose value is to be modified.

value A SymbolicConstant specifying the value of the smoothness of the surface-to-surface formulation on sliding to be assigned to the surface whose index is referenced. Possible values are NONE and SMALL_SLIDING.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

appendInStep(...)

This method allows you to add sliding formulation assignments to new surface pairs in a given step.

Required arguments

stepName A String specifying the name of the step in which the sliding formulation assignments are to be defined.

assignments A sequence of tuples specifying the sliding formulation assignments. Each tuple contains two entries:

- A region object or the SymbolicConstant GLOBAL specifying the surface to which the sliding formulation attribute is assigned.

- A SymbolicConstant specifying the overriding the smoothness value to be used for the first surface. Possible values of the SymbolicConstant are NONE and SMALL_SLIDING.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

delete(...)

The `delete` method allows you to delete existing sliding formulation assignments.

Required arguments

indices A sequence of Ints specifying the index of each sliding formulation assignment to delete.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

Members

The SlidingFormulationAssignment object has no members.

Corresponding analysis keywords

- **CONTACT FORMULATION*, TYPE=SLIDING FORMULATION

slidingTransitionAssignments object

The SlidingTransitionAssignment object stores the sliding transition assignment definition for surfaces in *ContactStd* objects. The SlidingTransitionAssignment object has no constructor or members.

Access

```
import interaction
mdb.models[name].interactions[name].slidingTransitionAssignments
```

changeValuesInStep(...)

This method allows you to modify sliding transition assignments already defined on surface pairs in a given step.

Required arguments

stepName A String specifying the name of the step in which the sliding transition assignments are to be modified.

index An Int specifying the position of the sliding transition assignment whose value is to be modified.

value A SymbolicConstant specifying the value of the smoothness of the surface-to-surface formulation on sliding to be assigned to the surface whose index is referenced. Possible values are ELEMENT_ORDER_SMOOTHING, LINEAR_SMOOTHING, and QUADRATIC_SMOOTHING.

Optional arguments

None.

Return value

None.

Exceptions

None.

appendInStep(...)

This method allows you to add sliding transition assignments to new surface pairs in a given step.

Required arguments

stepName A String specifying the name of the step in which the sliding transition assignments are to be defined.

assignments A sequence of tuples specifying the sliding transition assignments. Each tuple contains two entries:

- A region object or the SymbolicConstant GLOBAL specifying the surface to which the sliding transition attribute is assigned.

- A SymbolicConstant specifying the overriding the smoothness value to be used for the first surface. Possible values of the SymbolicConstant are ELEMENT_ORDER_SMOOTHING, LINEAR_SMOOTHING, and QUADRATIC_SMOOTHING.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`delete(...)`

The `delete` method allows you to delete existing sliding transition assignments.

Required arguments

indices A sequence of Ints specifying the index of each sliding transition assignment to delete.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

Members

The SlidingTransitionAssignment object has no members.

Corresponding analysis keywords

- **CONTACT FORMULATION*, TYPE=SLIDING TRANSITION

SmoothingAssignment object

The SmoothingAssignment object stores the surface smoothing assignment definition for surfaces in *ContactExp* and *ContactStd* objects. The SmoothingAssignment object has no constructor or members.

Access

```
import interaction
mdb.models[name].interactions[name].smoothingAssignments
```

changeValuesInStep(...)

This method allows modification of surface smoothing assignments already defined on surfaces in a given step.

Required arguments

stepName A String specifying the name of the step in which the surface smoothing assignments are to be modified.

index An Int specifying the position of the surface smoothing assignment whose value is to be modified.

value A tuple specifying the value of the surface smoothing assignments for the surface whose index is referenced. Each tuple contains one entry:

- A SymbolicConstant specifying the surface smoothing value to be used for the surface. Possible values of the SymbolicConstant are NONE, REVOLUTION, SPHERICAL, and TOROIDAL.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

appendInStep(...)

This method allows addition of surface smoothing assignments to new surfaces in a given step.

Required arguments

stepName A String specifying the name of the step in which new surface smoothing assignments are to be defined.

assignments A sequence of tuples specifying the surface smoothing assignments. Each tuple contains two entries:

- A region object specifying the surface to which the smoothing is assigned.
- A SymbolicConstant specifying the surface smoothing value to be used for the surface. Possible values of the SymbolicConstant are NONE, REVOLUTION, SPHERICAL, and TOROIDAL.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`delete(...)`

The `delete` method allows you to delete existing surface smoothing assignments from *ContactExp* and *ContactStd* objects.

Required arguments

indices A sequence of Ints specifying the index of each surface smoothing assignment to delete.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

Members

The SmoothingAssignment object has no members.

Corresponding analysis keywords

- **SURFACE PROPERTY ASSIGNMENT*, PROPERTY=GEOMETRIC CORRECTION

StabilizationAssignment object

The StabilizationAssignment object stores the contact stabilization assignment definition for domain pairs in a *ContactStd* object. The StabilizationAssignment object has no constructor or members.

Access

```
import interaction
mdb.models[name].interactions[name].stabilizationAssignments
```

changeValuesInStep(...)

This method allows modification of contact stabilization assignments to domain pairs already defined in a given step.

Required arguments

stepName A String specifying the name of the step in which the contact stabilization assignments are to be modified.

index An Int specifying the position of the contact stabilization assignment whose value is to be modified.

value A String specifying the value of the contact stabilization to be assigned to the domain pair whose index is referenced.

Optional arguments

None.

Return value

None.

Exceptions

None.

appendInStep(...)

This method allows addition of contact stabilization assignments to new domain pairs in a given step.

Required arguments

stepName A String specifying the name of the step in which new contact stabilization assignments are to be defined.

assignments A sequence of tuples specifying the stabilizations assigned to each surface pair. Each tuple contains three entries:

- A region object or the SymbolicConstant GLOBAL.
- A region object or the SymbolicConstant SELF.

- A String specifying a *StdStabilization* object associated with this pair of regions.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`delete(...)`

The `delete` method allows you to delete existing contact stabilization assignments from a *ContactStd* object.

Required arguments

indices A sequence of Ints specifying the index of each contact stabilization assignment to delete.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

Members

The StabilizationAssignment object has no members.

Corresponding analysis keywords

- **CONTACT STABILIZATION*

StdContactControl object

The StdContactControl object is used in Abaqus/Standard analyses to specify optional solution controls for problems involving contact between bodies.

The StdContactControl object is derived from the *ContactControl* object.

Access

```
import interaction
mdb.models[name].contactControls[name]
```

StdContactControl(...)

This method creates an StdContactControl object.

Path

```
mdb.models[name].StdContactControl
```

Required arguments

name
A String specifying the contact controls repository key.

Optional arguments

stiffnessScaleFactor
A Float specifying the factor by which Abaqus/Standard will scale the default penalty stiffness to obtain the stiffnesses used for the contact pairs. Only contact interactions defined with augmented Lagrangian surface behavior will be affected by this argument. The default value is 1.0.

penetrationTolChoice
A SymbolicConstant specifying whether the allowable penetration is an absolute value or a value relative to the characteristic contact surface face dimension. Only contact interactions defined with augmented Lagrangian surface behavior will be affected by this argument. Possible values are RELATIVE and ABSOLUTE. The default value is RELATIVE.

relativePenetrationTolerance
A Float specifying the ratio of the allowable penetration to the characteristic contact surface face dimension. The float values represent percentages (e.g.: 0.001=0.1%). Only contact interactions defined with augmented Lagrangian surface behavior will be affected by this argument. The default value is 10^{-3}.

The *relativePenetrationTolerance* argument applies only when *penetrationTolChoice*=RELATIVE. The *relativePenetrationTolerance* and *absolutePenetrationTolerance* arguments are mutually exclusive.

absolutePenetrationTolerance
`None` or a Float specifying the allowable penetration. Only contact interactions defined with augmented Lagrangian surface behavior will be affected by this argument. The *absolutePenetrationTolerance* argument applies only when *penetrationTolChoice*=ABSOLUTE. The *relativePenetrationTolerance* and *absolutePenetrationTolerance* arguments are mutually exclusive. The default value is `None`.

frictionOnset

A SymbolicConstant specifying when the application of friction occurs. Possible values are:

- IMMEDIATE, specifying the friction is included in the increment when contact occurs.
- DELAYED, specifying the application of friction is delayed until the increment after contact occurs.

The default value is IMMEDIATE.

automaticTolerances

A Boolean specifying whether Abaqus/Standard should automatically compute an overclosure tolerance and a separation tolerance to prevent chattering in contact. The default value is OFF.

The *automaticTolerances* argument cannot be used with the *maxchp*, *perrmx*, and *uerrmx* arguments.

maxchp

An Int specifying the maximum number of points that are permitted to violate contact conditions in any increment. The default value is 0.

Either the *perrmx* or the *uerrmx* argument must be specified in conjunction with the *maxchp* argument.

perrmx

A Float specifying the maximum value of tensile stress (tensile force in GAP- or ITT-type contact elements) allowed to be transmitted at a contact point. The default value is 0.0.

The *perrmx* argument must be specified in conjunction with the *maxchp* argument.

uerrmx

A Float specifying the maximum overclosure distance allowed at a secondary node that is considered to be open. The default value is 0.0.

The *uerrmx* argument must be specified in conjunction with the *maxchp* argument.

stabilizeChoice

A SymbolicConstant specifying whether or not viscous damping will be specified, and if so, how it will be specified. Possible values are NONE, AUTOMATIC, and COEFFICIENT. The default value is NONE.

dampFactor

A Float specifying the value of the damping factor. This value is multiplied by the calculated damping coefficient. The default value is 1.0.

This argument is only valid when *stabilizeChoice*=AUTOMATIC.

dampCoef

A Float specifying the damping coefficient. The default value is 0.0.

This argument is only valid when *stabilizeChoice*=COEFFICIENT.

tangFraction

A Float specifying the tangential stabilization as a fraction of the normal stabilization (damping). The default value is 1.0.

This argument is valid only if *stabilizeChoice* = AUTOMATIC or COEFFICIENT.

eosFraction

A Float specifying the fraction of the damping that remains at the end of the step. The default value is 0.0.

This argument is valid only if *stabilizeChoice* = AUTOMATIC or COEFFICIENT.

zeroDampingChoice

A SymbolicConstant specifying how the zero-damping clearance will be specified. Possible values are COMPUTE and SPECIFY. The default value is COMPUTE.

This argument is valid only if *stabilizeChoice* = AUTOMATIC or COEFFICIENT.

zeroDamping

`None` or a Float specifying the clearance at which damping becomes zero. This argument is valid only when *zeroDampingChoice*=SPECIFY. This argument is valid only if *stabilizeChoice* = AUTOMATIC or COEFFICIENT. The default value is `None`.

enforceWithLagrangeMultipliers

A SymbolicConstant specifying whether to enforce the contact constraints with Lagrange multipliers. Possible values are DEFAULT, ENFORCEMENT_OFF, and ENFORCEMENT_ON. The default value is DEFAULT.

Return value

A StdContactControl object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the StdContactControl object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *StdContactControl* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The StdContactControl object has members with the same names and descriptions as the arguments to the *StdContactControl* method.

Corresponding analysis keywords

- **CONTACT CONTROLS*

StdInitialization object

The StdInitialization object is used in conjunction with *ContactStd* in Abaqus/Standard analyses to specify contact initialization data.

The StdInitialization object is derived from the *ContactInitialization* object.

Access

```
import interaction
mdb.models[name].contactInitializations[name]
```

StdInitialization(...)

This method creates a StdInitialization object.

Path

```
mdb.models[name].StdInitialization
```

Required arguments

name
A String specifying the contact initialization repository key.

Optional arguments

overclosureType
A SymbolicConstant specifying the type of overclosure to be defined. Possible values are ADJUST, INTERFERENCE, and CLEARANCE. The default value is ADJUST.

interferenceDistance
`None` or a Float specifying the interference distance. This argument is valid only when *overclosureType*=INTERFERENCE. The default value is `None`.

clearanceDistance
`None` or a Float specifying the initial clearance distance. This argument is valid only when *overclosureType*=CLEARANCE, and must be specified in that case. The default value is `None`.

openingTolerance
`None` or a Float specifying the distance tolerance within which initial openings will undergo strain-free adjustments. This argument is not valid when *overclosureType*=INTERFERENCE unless a value has been specified for *interferenceDistance*. The default value is `None`.

overclosureTolerance
`None` or a Float specifying the distance tolerance within which initial overclosures will undergo strain-free adjustments.. The default value is `None`.

Return value

A StdInitialization object.

Exceptions

RangeError.

setValues(...)

This method modifies the StdInitialization object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *StdInitialization* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The StdInitialization object has members with the same names and descriptions as the arguments to the *StdInitialization* method.

Corresponding analysis keywords

- **CONTACT INITIALIZATION DATA*

StdStabilization object

The StdStabilization object is used in conjunction with *ContactStd* in Abaqus/Standard analyses to specify contact stabilization.

The StdStabilization object is derived from the *ContactStabilization* object.

Access

```
import interaction
mdb.models[name].contactStabilizations[name]
```

StdStabilization(...)

This method creates a StdStabilization object.

Path

```
mdb.models[name].StdStabilization
```

Required arguments

name
A String specifying the contact stabilization repository key.

Optional arguments

zeroDistance
`None` or a Float specifying the clearance distance at which the stabilization becomes zero. The default value is `None`.

reductionFactor
A Float specifying the factor by which the analysis will reduce the contact stabilization coefficient per increment. The default value is 0.1.

scaleFactor
A Float specifying the factor by which the analysis will scale the contact stabilization coefficient. The default value is 1.0.

tangentialFactor
A Float specifying the factor that scales the contact stabilization coefficient in the tangential direction. The default value is 0.0.

amplitude
A String specifying the name of the *Amplitude* object that defines a time-dependent scale factor for contact stabilization over the step. The default value is an empty string.

reset
A Boolean specifying whether to cancel carryover effects from contact stabilization specifications involving nondefault amplitudes that appeared in previous steps. The default value is OFF.

Return value

A StdStabilization object.

Exceptions

RangeError.

setValues(...)

This method modifies the StdStabilization object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *StdStabilization* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The StdStabilization object has members with the same names and descriptions as the arguments to the *StdStabilization* method.

Corresponding analysis keywords

StdXplCosimulation object

The StdXplCosimulation object defines co-simulation behavior between Abaqus/Standard and Abaqus/Explicit.

The StdXplCosimulation object is derived from the *Interaction* object.

Access

```
import interaction
mdb.models[name].interactions[name]
```

StdXplCosimulation(...)

This method creates a StdXplCosimulation object.

Path

```
mdb.models[name].StdXplCosimulation
```

Required arguments

name
A String specifying the repository key.

createStepName
A String specifying the name of the step in which the StdXplCosimulation object is created.

region
A *Region* object specifying the import and export region upon which the co-simulation exchanges data with the coupled analysis program.

Optional arguments

incrementation
A SymbolicConstant specifying whether the analysis programs use the same time increments or one is allowed to use more time increments than the other before exchanging data. Possible values are ALLOW_SUBCYCLING and LOCKSTEP. The default value is ALLOW_SUBCYCLING.

stepSize
A Float specifying the size of the increments to be used by Abaqus/Standard and Abaqus/Explicit. The default value is 0.0.

stepSizeDefinition
A SymbolicConstant specifying whether the increment size is the analysis default or a supplied variable. Possible values are DEFAULT and SPECIFIED. The default value is DEFAULT.

Return value

A StdXplCosimulation object.

Exceptions

None.

`setValues(...)`

This method modifies the StdXplCosimulation object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *StdXplCosimulation* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

Members

The StdXplCosimulation object has members with the same names and descriptions as the arguments to the *StdXplCosimulation* method.

StdXplCosimulationState object

The StdXplCosimulationState object stores the propagating data for a *StdXplCosimulation* object. One instance of this object is created internally by the *StdXplCosimulation* object for each step. The instance is also deleted internally by the *StdXplCosimulation* object.

The StdXplCosimulationState object has no constructor or methods.

The StdXplCosimulationState object is derived from the *InteractionState* object.

Access

```
import interaction
mdb.models[name].steps[name].interactionStates[name]
```

Members

The StdXplCosimulationState object has the following member:

status

A SymbolicConstant specifying the propagation state of the *InteractionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

Corresponding analysis keywords

- **CO-SIMULATION REGION*,

SurfaceBeamSmoothingAssignment object

The SurfaceBeamSmoothingAssignment object stores the surface beam smoothing assignment definition for surfaces in *ContactStd* objects. The SurfaceBeamSmoothingAssignment object has no constructor or members.

Access

```
import interaction
mdb.models[name].interactions[name].surfaceBeamSmoothingAssignments
```

changeValuesInStep(...)

This method allows modification of surface beam smoothing assignments already defined on surfaces in a given step.

Required arguments

stepName A String specifying the name of the step in which the surface beam smoothing assignments are to be modified.

index An Int specifying the position of the surface beam smoothing assignment whose value is to be modified.

value A tuple specifying the value of the surface beam smoothing assignments for the surface whose index is referenced. Each tuple contains one entry:

- A Float specifying the surface beam smoothing value to be used for the surface.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

appendInStep(...)

This method allows addition of surface beam smoothing assignments to new surfaces in a given step.

Required arguments

stepName A String specifying the name of the step in which new surface beam smoothing assignments are to be defined.

assignments A sequence of tuples specifying the surface beam smoothing assignments. Each tuple contains two entries:

- A region object specifying the surface to which the smoothing is assigned.
- A Float specifying the surface smoothing value to be used for the surface.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`delete(...)`

The `delete` method allows you to delete existing surface beam smoothing assignments from *ContactStd* objects.

Required arguments

indices A sequence of Ints specifying the index of each surface beam smoothing assignment to delete.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

Members

The SurfaceBeamSmoothingAssignment object has no members.

Corresponding analysis keywords

- **SURFACE PROPERTY ASSIGNMENT*, PROPERTY=BEAM SMOOTHING

SurfaceCrushTriggerAssignment object

The SurfaceCrushTriggerAssignment object stores the surface crush trigger assignment definition for surfaces in *ContactExp* objects. The SurfaceCrushTriggerAssignment object has no constructor or members.

Access

```
import interaction
mdb.models[name].interactions[name].surfaceCrushTriggerAssignments
```

changeValuesInStep(...)

This method allows modification of surface crush trigger assignments already defined on surfaces in a given step.

Required arguments

stepName A String specifying the name of the step in which the surface crush trigger assignments are to be modified.

index An Int specifying the position of the surface crush trigger assignment whose value is to be modified.

value A tuple specifying the value of the surface crush trigger assignments for the surface whose index is referenced. Each tuple contains three entries:

- A SymbolicConstant specifying the trigger option to be used for the surface. Possible values of the SymbolicConstant are TRIGGER, NO_TRIGGER, or NO_CRUSH.
- A Float specifying the crush stress value to be used for the surface.
- A Float specifying the crush initiation angle value to be used for the surface.
- A Float specifying the crush continuation angle value to be used for the surface.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

appendInStep(...)

This method allows addition of surface crush trigger assignments to new surfaces in a given step.

Required arguments

stepName A String specifying the name of the step in which new surface crush trigger assignments are to be defined.

assignments A sequence of tuples specifying the surface crush trigger assignments. Each tuple contains four entries:

- A region or a material object or the SymbolicConstant GLOBAL specifying the surface to which the feature angle is assigned.
- A SymbolicConstant specifying the trigger option to be used for the surface. Possible values of the SymbolicConstant are TRIGGER, NO_TRIGGER, or NO_CRUSH.
- A Float specifying the crush stress value to be used for the surface.
- A Float specifying the crush initiation angle value to be used for the surface.
- A Float specifying the crush continuation angle value to be used for the surface.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`delete(...)`

The `delete` method allows you to delete existing surface crush trigger assignments from a *ContactExp* object.

Required arguments

indices A sequence of Ints specifying the index of each surface crush trigger assignment to delete.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

Members

The SurfaceCrushTriggerAssignment object has no members.

Corresponding analysis keywords

- **SURFACE PROPERTY ASSIGNMENT*, PROPERTY=CRUSH TRIGGER

SurfaceFeatureAssignment object

The SurfaceFeatureAssignment object stores the surface feature angle assignment definition for surfaces in *ContactExp* or *ContactStd* objects. The SurfaceFeatureAssignment object has no constructor or members.

Access

```
import interaction
mdb.models[name].interactions[name].surfaceFeatureAssignments
```

changeValuesInStep(...)

This method allows modification of surface feature angle assignments already defined on surfaces in a given step.

Required arguments

stepName A String specifying the name of the step in which the surface feature assignments are to be modified.

index An Int specifying the position of the surface feature angle assignment whose value is to be modified.

value A tuple specifying the value of the surface feature assignments for the surface whose index is referenced. Each tuple contains two entries for Abaqus/Standard and three entries for Abaqus/Explicit:

- A Float or a SymbolicConstant specifying the overriding surface primary feature angle value to be used for the surface. Possible values of the SymbolicConstant are PERIMETER, ALL, PICKED, or NONE. The ALL and PICKED values cannot be specified with the GLOBAL region constant and can be used only in the Abaqus/Explicit version of general contact.
- A Float or a SymbolicConstant specifying the overriding surface secondary feature angle value to be used for the surface. Possible values of the SymbolicConstant are PERIMETER, ALL, PICKED, or NONE. The ALL and PICKED values cannot be specified with the GLOBAL region constant and can be used only in the Abaqus/Explicit version of general contact.
- A SymbolicConstant ORIGINAL or CURRENT specifying the configuration.

Optional arguments

useDynFeatEdge A Boolean specifying whether the dynamic feature edge criterion should be activated for the contact surface in an Abaqus/Explicit analysis. This argument can be set to ON (default) or OFF.

Return value

`None.`

Exceptions

None.

appendInStep(...)

This method allows the addition of surface feature angle assignments to new surfaces in a given step.

Required arguments

stepName A String specifying the name of the step in which new surface feature angle assignments are to be defined.

assignments A sequence of tuples specifying the surface feature angle assignments. Each tuple contains three entries for Abaqus/Standard and four entries for Abaqus/Explicit:

- A region or a material object or the SymbolicConstant GLOBAL specifying the surface to which the feature angle is assigned.
- A Float or a SymbolicConstant specifying the overriding surface primary feature angle value to be used for the surface. Possible values of the SymbolicConstant are PERIMETER, ALL, PICKED, or NONE. The ALL and PICKED values cannot be specified with the GLOBAL region constant and can be used only in the Abaqus/Explicit version of general contact.
- A Float or a SymbolicConstant specifying the overriding surface secondary feature angle value to be used for the surface. Possible values of the SymbolicConstant are PERIMETER, ALL, PICKED, or NONE. The ALL and PICKED values cannot be specified with the GLOBAL region constant and can be used only in the Abaqus/Explicit version of general contact.
- A SymbolicConstant ORIGINAL or CURRENT specifying the configuration.

Optional arguments

useDynFeatEdge A Boolean specifying whether the dynamic feature edge criterion should be activated for the contact surface in an Abaqus/Explicit analysis. This argument can be set to ON (default) or OFF.

Return value

`None.`

Exceptions

None.

`delete(...)`

The `delete` method allows you to delete existing surface feature angle assignments from a *ContactExp* object.

Required arguments

indices A sequence of Ints specifying the index of each surface feature angle assignment to delete.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

Members

The SurfaceFeatureAssignment object has no members.

Corresponding analysis keywords

- **SURFACE PROPERTY ASSIGNMENT*, PROPERTY=FEATURE EDGE CRITERIA

SurfaceFrictionAssignment object

The SurfaceFrictionAssignment object stores the surface friction assignment definition for surfaces in *ContactExp* objects. The SurfaceFrictionAssignment object has no constructor or members.

Access

```
import interaction
mdb.models[name].interactions[name].surfaceFrictionAssignments
```

changeValuesInStep(...)

This method allows modification of surface friction assignments already defined on surfaces in a given step.

Required arguments

stepName A String specifying the name of the step in which the surface friction assignments are to be modified.

index An Int specifying the position of the surface friction assignment whose value is to be modified.

value A tuple specifying the value of the surface friction assignments for the surface whose index is referenced. Each tuple contains:

- A Float specifying the overriding friction coefficient value to be used in the contact definition.

Optional arguments

None.

Return value

None.

Exceptions

None.

appendInStep(...)

This method allows addition of surface friction assignments to new surfaces in a given step.

Required arguments

stepName A String specifying the name of the step in which new surface friction assignments are to be defined.

assignments A sequence of tuples specifying the surface friction assignments. Each tuple contains two entries:

- A region or a material object or the SymbolicConstant GLOBAL specifying the surface to which the friction coefficient is assigned.
- A Float specifying the overriding friction coefficient to be used in the contact definition.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`delete(...)`

The `delete` method allows you to delete existing surface friction assignments.

Required arguments

indices A sequence of Ints specifying the index of each surface friction assignment to delete.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

Members

The SurfaceFrictionAssignment object has no members.

Corresponding analysis keywords

- **SURFACE PROPERTY ASSIGNMENT*, PROPERTY=FRICTION

SurfaceOffsetAssignment object

The SurfaceOffsetAssignment object stores the surface offset fraction assignment definition for surfaces in *ContactExp* and *ContactStd* objects. The SurfaceOffsetAssignment object has no constructor or members.

Access

```
import interaction
mdb.models[name].interactions[name].surfaceOffsetAssignments
```

changeValuesInStep(...)

This method allows modification of surface offset fraction assignments already defined on surfaces in a given step.

Required arguments

stepName A String specifying the name of the step in which the surface offset assignments are to be modified.

index An Int specifying the position of the surface offset fraction assignment whose value is to be modified.

value A tuple specifying the value of the surface offset assignments for the surface whose index is referenced. Each tuple contains one entry:

- A Float or a SymbolicConstant specifying the surface offset fraction value to be used for the surface. Possible values of the SymbolicConstant are ORIGINAL, SPOS, and SNEG.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

appendInStep(...)

This method allows addition of surface offset fraction assignments to new surfaces in a given step.

Required arguments

stepName A String specifying the name of the step in which new surface offset fraction assignments are to be defined.

assignments A sequence of tuples specifying the surface offset fraction assignments. Each tuple contains two entries:

- A region or a material object or the SymbolicConstant GLOBAL specifying the surface to which the offset fraction is assigned.
- A Float or a SymbolicConstant specifying the surface offset fraction value to be used for the surface. Possible values of the SymbolicConstant are ORIGINAL, SPOS, and SNEG.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`delete(...)`

The `delete` method allows you to delete existing surface offset fraction assignments.

Required arguments

indices A sequence of Ints specifying the index of each surface offset fraction assignment to delete.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

Members

The SurfaceOffsetAssignment object has no members.

Corresponding analysis keywords

- **SURFACE PROPERTY ASSIGNMENT*, PROPERTY=OFFSET FRACTION

SurfaceThicknessAssignment object

The SurfaceThicknessAssignment object stores the surface thickness assignment definition for surfaces in *ContactExp* and *ContactStd* objects. The SurfaceThicknessAssignment object has no constructor or members.

Access

```
import interaction
mdb.models[name].interactions[name].surfaceThicknessAssignments
```

changeValuesInStep(...)

This method allows modification of surface thickness assignments already defined on surfaces in a given step.

Required arguments

stepName A String specifying the name of the step in which the surface thickness assignments are to be modified.

index An Int specifying the position of the surface thickness assignment whose value is to be modified.

value A tuple specifying the value of the surface thickness assignments for the surface whose index is referenced. Each tuple contains two entries:

- A Float or a SymbolicConstant specifying the overriding thickness value to be used in the contact definition. Possible values of the SymbolicConstant are ORIGINAL and THINNING. The SymbolicConstant THINNING can be specified only in an Abaqus/Explicit analysis.
- A Float specifying a scale factor that multiplies the thickness value specified in the second entry.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

appendInStep(...)

This method allows addition of surface thickness assignments to new surfaces in a given step.

Required arguments

stepName A String specifying the name of the step in which new surface thickness assignments are to be defined.

assignments A sequence of tuples specifying the surface thickness assignments. Each tuple contains three entries:

- A region or a material object or the SymbolicConstant GLOBAL specifying the surface to which the thickness is assigned.
- A Float or a SymbolicConstant specifying the overriding thickness value to be used in the contact definition. Possible values of the SymbolicConstant are ORIGINAL and THINNING. The SymbolicConstant THINNING can be specified only in an Abaqus/Explicit analysis.
- A Float specifying a scale factor that multiplies the thickness value specified in the second entry.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`delete(...)`

The `delete` method allows you to delete existing surface thickness assignments.

Required arguments

indices A sequence of Ints specifying the index of each surface thickness assignment to delete.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

Members

The SurfaceThicknessAssignment object has no members.

Corresponding analysis keywords

- **SURFACE PROPERTY ASSIGNMENT*, PROPERTY=THICKNESS

SurfaceToSurfaceContactExp object

The SurfaceToSurfaceContactExp object defines surface-to-surface contact during an Abaqus/Explicit analysis.

The SurfaceToSurfaceContactExp object is derived from the *Interaction* object.

Access

```
import interaction
mdb.models[name].interactions[name]
```

SurfaceToSurfaceContactExp(...)

This method creates a SurfaceToSurfaceContactExp object.

Path

```
mdb.models[name].SurfaceToSurfaceContactExp
```

Required arguments

name
A String specifying the repository key.

createStepName
A String specifying the name of the step in which the SurfaceToSurfaceContactExp object is created.

main
A *Region* object specifying the main surface.

secondary
A *Region* object specifying the secondary surface.

sliding
A SymbolicConstant specifying the contact formulation. Possible values are FINITE and SMALL.

interactionProperty
A String specifying the name of the *ContactProperty* object associated with this interaction.

Optional arguments

mechanicalConstraint
A SymbolicConstant specifying the mechanical constraint formulation. Possible values are KINEMATIC and PENALTY. The default value is KINEMATIC.

weightingFactorType
A SymbolicConstant specifying the weighting for node-to-face contact. Possible values are DEFAULT and SPECIFIED. The default value is DEFAULT.

weightingFactor
A Float specifying the weighting factor for the contact surfaces when *weightingFactorType*=SPECIFIED. The default value is 0.0.

contactControls
A String specifying the name of the *ContactControl* object associated with this interaction. An empty string indicates that the default contact controls will be used. The default value is an empty string.

initialClearance A SymbolicConstant or a Float specifying the initial clearance at regions of contact. Possible values are OMIT and COMPUTED. The default value is OMIT.

halfThreadAngle `None` or a sequence of Floats specifying the half thread angle used for bolt clearance. The default value is `None`.

pitch `None` or a sequence of Floats specifying the pitch used for bolt clearance. The default value is `None`.

majorBoltDiameter The SymbolicConstant COMPUTED or a Float specifying the major diameter of the bolt used for bolt clearance. The default value is COMPUTED.

meanBoltDiameter The SymbolicConstant COMPUTED or a Float specifying the mean diameter of the bolt used for bolt clearance. The default value is COMPUTED.

datumAxis A *DatumAxis* object specifying the orientation of the bolt hole when specifying bolt clearance.

useReverseDatumAxis A Boolean specifying whether to reverse the bolt clearance direction given by the datum axis. The default value is OFF.

clearanceRegion A *Region* object specifying the contact region for which clearance is specified.

Return value

A SurfaceToSurfaceContactExp object.

Exceptions

None.

swapSurfaces()

This method switches the main and secondary surfaces of a surface-to-surface contact pair. This command is valid only during the step in which the interaction is created.

Arguments

None.

Return value

`None.`

Exceptions

None.

setValues(...)

This method modifies the data for an existing SurfaceToSurfaceContactExp object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *SurfaceToSurfaceContactExp* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing SurfaceToSurfaceContactExp object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the interaction is modified.

Optional arguments

interactionProperty A String specifying the name of the *ContactProperty* object associated with this interaction.

contactControls A String specifying the name of the *ContactControl* object associated with this interaction. An empty string indicates that the default contact controls will be used. The default value is an empty string.

Return value

`None.`

Exceptions

None.

Members

The SurfaceToSurfaceContactExp object has members with the same names and descriptions as the arguments to the *SurfaceToSurfaceContactExp* method except the optional arguments to the *setValuesInStep* method.

SurfaceToSurfaceContactStd object

The SurfaceToSurfaceContactStd object defines surface-to-surface contact during an Abaqus/Standard analysis.

The SurfaceToSurfaceContactStd object is derived from the *Interaction* object.

Access

```
import interaction
mdb.models[name].interactions[name]
```

SurfaceToSurfaceContactStd(...)

This method creates a SurfaceToSurfaceContactStd object.

Path

```
mdb.models[name].SurfaceToSurfaceContactStd
```

Required arguments

name
A String specifying the repository key.

createStepName
A String specifying the name of the step in which the SurfaceToSurfaceContactStd object is created.

main
A *Region* object specifying the main surface.

secondary
A *Region* object specifying the secondary surface.

sliding
A SymbolicConstant specifying the contact formulation. Possible values are FINITE and SMALL.

interactionProperty
A String specifying the name of the *ContactProperty* object associated with this interaction.

Optional arguments

interferenceType
A SymbolicConstant specifying the type of time-dependent allowable interference for contact pairs and contact elements. Possible values are:

- NONE, specifying no allowable contact interference.
- SHRINK_FIT.
- UNIFORM.

The default value is NONE.

overclosure
A Float specifying the maximum overclosure distance allowed. This argument applies only when *interferenceType*=UNIFORM. The default value is 0.0.

interferenceDirectionType

A SymbolicConstant specifying the method used to determine the interference direction. Possible values are COMPUTED and DIRECTION_COSINE. The default value is COMPUTED.

direction

A sequence of three Floats specifying the following:

- ***X***-direction cosine of the interference direction vector.
- ***Y***-direction cosine of the interference direction vector.
- ***Z***-direction cosine of the interference direction vector.

This argument is required only when *interferenceDirectionType*=DIRECTION_COSINE.

amplitude

A String specifying the name of the amplitude curve that defines the magnitude of the prescribed interference during the step. Use `None` to specify that the prescribed interference is applied immediately at the beginning of the step and ramped down to zero linearly over the step.

smooth

A Float specifying the degree of smoothing used for deformable or rigid main surfaces involved when *enforcement*=NODE_TO_SURFACE. The value given must lie between 0.0 and 0.5. The default value is 0.2.

hcrit

A Float specifying the distance by which a secondary node must penetrate the main surface before Abaqus/Standard abandons the current increment and tries again with a smaller increment. The default value is 0.0.

extensionZone

A Float specifying a fraction of the end segment or facet edge length by which the main surface is to be extended to avoid numerical round-off errors associated with contact modeling. The value given must lie between 0.0 and 0.2. The default value is 0.1.

adjustMethod

A SymbolicConstant specifying the adjust method. Possible values are NONE, OVERCLOSED, TOLERANCE, and SET. The default value is NONE.

adjustTolerance

A Float specifying the adjust tolerance. The default value is 0.0.

adjustSet

A *Region* object specifying the Set object to which the adjustment is to be applied.

enforcement

A SymbolicConstant specifying the discretization method. Possible values are NODE_TO_SURFACE and SURFACE_TO_SURFACE. The default value is SURFACE_TO_SURFACE.

thickness

A Boolean specifying whether shell/membrane element thickness is considered. The default value is ON.

This argument is not valid when *sliding*=FINITE and *enforcement*=NODE_TO_SURFACE.

contactControls

A String specifying the name of the *ContactControl* object associated with this interaction. The empty string indicates that the default contact controls will be used. The default value is an empty string.

tied
A Boolean specifying whether the surfaces are to be "tied" together for the duration of the simulation. The default value is OFF.

initialClearance
A SymbolicConstant or a Float specifying the initial clearance at regions of contact. Possible values are OMIT and COMPUTED. The default value is OMIT.

halfThreadAngle
`None` or a sequence of Floats specifying the half thread angle used for bolt clearance. The default value is `None`.

pitch
`None` or a sequence of Floats specifying the pitch used for bolt clearance. The default value is `None`.

majorBoltDiameter
The SymbolicConstant COMPUTED or a Float specifying the major diameter of the bolt used for bolt clearance. The default value is COMPUTED.

meanBoltDiameter
The SymbolicConstant COMPUTED or a Float specifying the mean diameter of the bolt used for bolt clearance. The default value is COMPUTED.

datumAxis
A *DatumAxis* object specifying the orientation of the bolt hole when specifying bolt clearance.

useReverseDatumAxis
A Boolean specifying whether to reverse the bolt clearance direction given by the datum axis. The default value is OFF.

clearanceRegion
A *Region* object specifying the contact region for which clearance is specified.

surfaceSmoothing
A SymbolicConstant specifying whether to use surface smoothing for geometric surfaces in SurfaceToSurfaceContactStd interactions. Possible values are AUTOMATIC and NONE. The default value is NONE.

bondingSet
A *Region* object specifying the secondary node sub-set for bonding, used only when the contact property *CohesiveBehavior* option specifies use.

handedness
A SymbolicConstant specifying the bolt handedness formulation. Possible values are RIGHT and LEFT. The default value is RIGHT.

normalAdjustment
A SymbolicConstant specifying the bolt normal adjustment formulation for all secondary nodes. Possible values are UNIFORM AXIAL COMPONENT and LOCATION DEPENDENT. The default value is UNIFORM AXIAL COMPONENT.

Return value

A SurfaceToSurfaceContactStd object.

Exceptions

None.

swapSurfaces()

This method switches the main and secondary surfaces of a surface-to-surface contact pair. This command is valid only for the step in which the interaction is created.

Arguments

None.

Return value

`None.`

Exceptions

None.

setValues(...)

This method modifies the data for an existing SurfaceToSurfaceContactStd object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *SurfaceToSurfaceContactStd* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing SurfaceToSurfaceContactStd object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the interaction is modified.

Optional arguments

interactionProperty A String specifying the name of the *ContactProperty* object associated with this interaction.

interferenceType A SymbolicConstant specifying the type of time-dependent allowable interference for contact pairs and contact elements. Possible values are:

- NONE, specifying no allowable contact interference.
- SHRINK_FIT.
- UNIFORM.

The default value is NONE.

overclosure

A Float specifying the maximum overclosure distance allowed. This argument applies only when *interferenceType*=UNIFORM. The default value is 0.0.

interferenceDirectionType

A SymbolicConstant specifying the method used to determine the interference direction. Possible values are COMPUTED and DIRECTION_COSINE. The default value is COMPUTED.

direction

A sequence of three Floats specifying the following:

- ***X***-direction cosine of the interference direction vector.
- ***Y***-direction cosine of the interference direction vector.
- ***Z***-direction cosine of the interference direction vector.

This argument is required only when *interferenceDirectionType*=DIRECTION_COSINE.

amplitude

A String specifying the name of the amplitude curve that defines the magnitude of the prescribed interference during the step. Use `None` to specify that the prescribed interference is applied immediately at the beginning of the step and ramped down to zero linearly over the step.

contactControls

A String specifying the name of the *ContactControl* object associated with this interaction. The empty string indicates that the default contact controls will be used. The default value is an empty string.

Return value

`None.`

Exceptions

None.

Members

The SurfaceToSurfaceContactStd object has members with the same names and descriptions as the arguments to the *SurfaceToSurfaceContactStd* method except the optional arguments to the *setValuesInStep* method.

In addition, the SurfaceToSurfaceContactStd object has the following members:

contactTracking

A SymbolicConstant specifying the choice of contact tracking algorithm. The STATE tracking algorithm uses only normal projections and is specified by using ONE_CONFIG. The PATH tracking algorithm uses crossing and normal projections and is specified by using TWO_CONFIG. Possible values are ONE_CONFIG and TWO_CONFIG. The default value is TWO_CONFIG.

This argument is valid only when *sliding*=FINITE and *enforcement*=SURFACE_TO_SURFACE.

supplementaryContact

A SymbolicConstant specifying the manner in which midface constraints are employed. Possible values are SELECTIVE, NEVER, and ALWAYS. The default value is SELECTIVE.

This argument is not valid when *sliding*=FINITE and *enforcement*=SURFACE_TO_SURFACE.

SurfaceToSurfaceExpState object

The SurfaceToSurfaceExpState object stores the propagating data for a *SurfaceToSurfaceContactExp* object. One instance of this object is created internally by the *SurfaceToSurfaceContactExp* object for each step. The instance is also deleted internally by the *SurfaceToSurfaceContactExp* object.

The SurfaceToSurfaceExpState object has no constructor or methods.

The SurfaceToSurfaceExpState object is derived from the *InteractionState* object.

Access

```
import interaction
mdb.models[name].steps[name].interactionStates[name]
```

Members

The SurfaceToSurfaceExpState object has the following members:

interactionPropertyState

A SymbolicConstant specifying the propagation state of the *interactionProperty* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

contactControlsState

A SymbolicConstant specifying the propagation state of the *contactControls* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

interactionProperty

A String specifying the name of the *ContactProperty* object associated with this interaction.

contactControls

A String specifying the name of the *ContactControl* object associated with this interaction.

status

A SymbolicConstant specifying the propagation state of the *InteractionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

Corresponding analysis keywords

- **CONTACT PAIR*

SurfaceToSurfaceStdState object

The SurfaceToSurfaceStdState object stores the propagating data for a *SurfaceToSurfaceContactStd* object. One instance of this object is created internally by the *SurfaceToSurfaceContactStd* object for each step. The instance is also deleted internally by the *SurfaceToSurfaceContactStd* object.

The SurfaceToSurfaceStdState object has no constructor or methods.

The SurfaceToSurfaceStdState object is derived from the *InteractionState* object.

Access

```
import interaction
mdb.models[name].steps[name].interactionStates[name]
```

Members

The SurfaceToSurfaceStdState object has the following members:

interactionPropertyState
A SymbolicConstant specifying the propagation state of the *interactionProperty* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

interferenceType
A SymbolicConstant specifying the interference type. Possible values are NONE, SHRINK_FIT, and UNIFORM.

interferenceTypeState
A SymbolicConstant specifying the propagation state of the *interferenceType* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

overclosure
A Float specifying the allowable overclosure.

overclosureState
A SymbolicConstant specifying the propagation state of the *overclosure* member. Possible values are COMPUTED and DIRECTION_COSINE.

interferenceDirectionType
A SymbolicConstant specifying the interference direction type. Possible values are COMPUTED and DIRECTION_COSINE.

interferenceDirectionTypeState
A SymbolicConstant specifying the propagation state of the *interferenceDirectionType* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

directionState
A SymbolicConstant specifying the propagation state of the *direction* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

amplitudeState
A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

contactControlsState
A SymbolicConstant specifying the propagation state of the *contactControls* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

interactionProperty
A String specifying the name of the *ContactProperty* object associated with this interaction.

amplitude

A String specifying the name of the Amplitude object that defines the magnitude of the prescribed interference during the step.

contactControls

A String specifying the name of the *ContactControl* object associated with this interaction.

direction

A tuple of three Floats specifying the following:

- ***X***-direction cosine of the interference direction vector.
- ***Y***-direction cosine of the interference direction vector.
- ***Z***-direction cosine of the interference direction vector.

status

A SymbolicConstant specifying the propagation state of the *InteractionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

SurfaceVertexCriteriaAssignment object

The SurfaceVertexCriteriaAssignment object stores the surface vertex criteria assignment definition for surfaces in *ContactStd* objects. The SurfaceVertexCriteriaAssignment object has no constructor or members.

Access

```
import interaction
mdb.models[name].interactions[name].surfacevertexCriteriaAssignments
```

changeValuesInStep(...)

This method allows modification of surface vertex criteria assignments already defined on surfaces in a given step.

Required arguments

stepName
A String specifying the name of the step in which the surface vertex criteria assignments are to be modified.

index
An Int specifying the position of the surface vertex criteria assignment whose value is to be modified.

value
A tuple specifying the value of the surface vertex criteria assignments for the surface whose index is referenced. Each tuple contains:

- A Float or a SymbolicConstant specifying the vertex criteria value to be used for the surface. Possible values of the SymbolicConstant are ALL_VERTICES or NO_VERTICES.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

appendInStep(...)

This method allows addition of surface vertex criteria assignments to new surfaces in a given step.

Required arguments

stepName
A String specifying the name of the step in which new surface vertex criteria assignments are to be defined.

assignments
A sequence of tuples specifying the surface vertex criteria assignments. Each tuple contains two entries:

- A region or a material object or the SymbolicConstant GLOBAL specifying the surface to which the vertex criteria is assigned.
- A Float or a SymbolicConstant specifying the vertex criteria value to be used for the surface. Possible values of the SymbolicConstant are ALL_VERTICES or NO_VERTICES.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`delete(...)`

The `delete` method allows you to delete existing surface vertex criteria assignments from a *ContactStd* object.

Required arguments

indices
A sequence of Ints specifying the index of each surface vertex criteria assignment to delete.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

Members

The SurfaceVertexCriteriaAssignment object has no members.

Corresponding analysis keywords

- **SURFACE PROPERTY ASSIGNMENT*, PROPERTY=VERTEX CRITERIA

ThermalConductance object

The ThermalConductance object specifies thermal conductance for a contact interaction property.

Access

```
import interaction
mdb.models[name].interactionProperties[name].thermalConductance
```

ThermalConductance(...)

This method creates a ThermalConductance object.

Path

```
mdb.models[name].interactionProperties[name].ThermalConductance
```

Required arguments

None.

Optional arguments

definition
A SymbolicConstant specifying how the thermal conductance is defined. Possible values are TABULAR and USER_DEFINED. The default value is TABULAR.

clearanceDependency
A Boolean specifying whether to use clearance-dependent data. The default value is ON.

pressureDependency
A Boolean specifying whether to use pressure-dependent data. The default value is OFF.

temperatureDependencyC
A Boolean specifying whether to use temperature-dependent data with clearance dependency. The default value is OFF.

massFlowRateDependencyC
A Boolean specifying whether to use mass-flow-rate-dependent data with clearance dependency. The default value is OFF.

dependenciesC
An Int specifying the number of field variables to use with clearance dependency. The default value is 0.

clearanceDepTable
A sequence of sequences of Floats specifying clearance dependency data. The items in the table data are described below.

temperatureDependencyP
A Boolean specifying whether to use temperature-dependent data with pressure dependency. The default value is OFF.

massFlowRateDependencyP
A Boolean specifying whether to use mass-flow-rate-dependent data with pressure dependency. The default value is OFF.

dependenciesP An Int specifying the number of field variables to use with pressure dependency. The default value is 0.

pressureDepTable A sequence of sequences of Floats specifying pressure dependency data. The items in the table data are described below.

Table data

The *clearanceDepTable* data specify the following:

- Conductivity.
- Clearance.
- Temperature, if the data depend on temperature.
- Mass flow rate, if the data depend on mass flow rate.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

The *pressureDepTable* data specify the following:

- Conductivity.
- Pressure.
- Temperature, if the data depend on temperature.
- Mass flow rate, if the data depend on mass flow rate.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A ThermalConductance object.

Exceptions

None.

`setValues(...)`

This method modifies the ThermalConductance object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ThermalConductance* method.

Return value

`None.`

Exceptions

None.

Members

The ThermalConductance object has members with the same names and descriptions as the arguments to the *ThermalConductance* method.

Corresponding analysis keywords

- **GAP CONDUCTANCE*

WearProperty object

The WearProperty object defines a wear interaction property.

The WearProperty object is derived from the *InteractionProperty* object.

Access

```
import interaction
mdb.models[name].interactionProperties[name]
```

WearProperty(...)

This method creates a WearProperty object.

Path

```
mdb.models[name].WearProperty
```

Required arguments

name A String specifying the interaction property repository key.

Optional arguments

fricCoefDependency A Boolean specifying whether the Archard's wear equation depends explicitly on the friction coefficient. The default value is OFF.

unitlessWearCoefDependency A Boolean specifying whether the wear coefficient is dimensionless. The default value is OFF.

referenceStress A Float specifying the value of the reference stress. This parameter is required if unitlessWearCoefDependency is ON.

surfaceWearDistanceDependency A Boolean specifying whether the wear coefficient is dependent on the wear distance. The default value is OFF.

temperatureDependency A Boolean specifying whether the wear coefficient is dependent on the surface temperature. The default value is OFF.

contactPressureDependency A Boolean specifying whether the wear coefficient is dependent on the contact pressure. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Return value

A WearProperty object.

Exceptions

None.

Members

The WearProperty object can have the following members:

Corresponding analysis keywords

- **SURFACE INTERACTION*

WearSurfacePropertyAssignment object

The WearSurfacePropertyAssignment object stores the wear surface property assignment definition for domain pairs in *ContactExp* and *ContactStd* objects. The WearSurfacePropertyAssignment object has no constructor or members.

Access

```
import interaction
mdb.models[name].interactions[name].wearSurfacePropertyAssignments
```

changeValuesInStep(...)

This method allows modification of contact property assignments to domain pairs already defined in a given step.

Required arguments

stepName A String specifying the name of the step in which the contact property assignments are to be modified.

index An Int specifying the position of the contact property assignment whose value is to be modified.

value A String specifying the value of the wear surface property to be assigned to the domain pair whose index is referenced.

Optional arguments

None.

Return value

None.

Exceptions

None.

appendInStep(...)

This method allows the addition of wear surface property assignments to new domain pairs in a given step.

Required arguments

stepName A String specifying the name of the step in which new contact property assignments are to be defined.

assignments A sequence of tuples specifying the properties assigned to each surface pair. Each tuple contains two entries:

- A region or a material object or the SymbolicConstant GLOBAL.
- A String specifying a *WearProperty* object associated with this pair of regions.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`delete(...)`

The `delete` method allows you to delete existing contact property assignments.

Required arguments

indices
A sequence of Ints specifying the index of each contact property assignment to delete. The *indices* and *surfPair* arguments are mutually exclusive.

surfPair
A sequence of tuples specifying the surface pair of each contact property assignment to delete. Each tuple contains two entries:

- A region or a material object or the SymbolicConstant GLOBAL.

surfPair and *indices* arguments are mutually exclusive.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

Members

The WearSurfacePropertyAssignment object has no members.

Corresponding analysis keywords

- **SURFACE PROPERTY ASSIGNMENT*

XFEMCrackGrowth object

The XFEMCrackGrowth object defines the enrichment activation state for an *XFEMCrack*.

The XFEMCrackGrowth object is derived from the *Interaction* object.

Access

```
import interaction
mdb.models[name].interactions[name]
```

XFEMCrackGrowth(...)

This method creates an XFEMCrackGrowth object.

Path

```
mdb.models[name].XFEMCrackGrowth
```

Required arguments

name A String specifying the repository key.

createStepName A String specifying the name of the step in which the XFEMCrackGrowth object is created.

crackName A String specifying the *XFEMCrack* object associated with this interaction.

Optional arguments

allowGrowth A Boolean specifying whether the crack is allowed to grow (propagate) during this analysis step. The default value is ON.

Return value

A XFEMCrackGrowth object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing XFEMCrackGrowth object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *XFEMCrackGrowth* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing XFEMCrackGrowth object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the interaction is modified.

Optional arguments

allowGrowth A Boolean specifying whether the crack is allowed to grow (propagate) during this analysis step. The default value is ON.

Return value

`None.`

Exceptions

None.

Members

The XFEMCrackGrowth object has members with the same names and descriptions as the arguments to the *XFEMCrackGrowth* method.

Corresponding analysis keywords

- **ENRICHMENT ACTIVATION*

XFEMCrackGrowthState object

The XFEMCrackGrowthState object stores the propagating data of an *XFEMCrackGrowth* object in a step. One instance of this object is created internally by the *XFEMCrackGrowth* object for each step. The instance is also deleted internally by the *XFEMCrackGrowth* object.

The XFEMCrackGrowthState object has no constructor or methods.

The XFEMCrackGrowthState object is derived from the *InteractionState* object.

Access

```
import interaction
mdb.models[name].steps[name].interactionStates[name]
```

Members

The XFEMCrackGrowthState object has the following members:

allowGrowth

A Boolean specifying whether the crack is allowed to grow (propagate) during this analysis step. The default value is ON.

allowGrowthState

A SymbolicConstant specifying the propagation state of the *allowGrowth* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *InteractionState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

Corresponding analysis keywords

Job commands

The Job commands provide methods to create, modify, submit, and control jobs.

In this section:

- *Job object*
- *JobFromInputFile object*
- *Message object*
- *ModelJob object*
- *Queue object*
- *Coexecution object*
- *OptimizationProcess object*

Job object

The Job object is the abstract base type for other Job objects. The Job object has no explicit constructor. The methods and members of the Job object are common to all objects derived from Job.

Access

```
import job
mdb.coexecutions[name].jobs[name]
mdb.jobs[name]
```

kill()

This method ends the analysis of a job.

Arguments

None.

Return value

None.

Exceptions

None.

submit(...)

This method submits a job for analysis.

Required arguments

None.

Optional arguments

consistencyChecking A Boolean specifying whether to perform consistency checking for the job. The default value is ON. It is not recommended that you turn off the consistency checking unless you are absolutely sure the model is consistent.

datacheckJob A Boolean specifying whether to run the job as a datacheck analysis. The default value is False. The datacheckJob and continueJob arguments cannot both be True.

continueJob A Boolean specifying whether to run the job as a continuation analysis. The default value is False. The datacheckJob and continueJob arguments cannot both be True.

Return value

None.

Exceptions

None.

waitForCompletion()

This method interrupts the execution of the script until the end of the analysis. If you call the `waitForCompletion` method and the *status* member is neither SUBMITTED nor RUNNING, Abaqus assumes that the analysis has either completed or stopped and returns immediately.

Arguments

None.

Return value

`None.`

Exceptions

None.

clearMessages

This method clears *messages* and sets the *status* to NONE.

Arguments

None.

Return value

`None.`

Exceptions

None.

Members

The Job object can have the following members:

name

A String specifying the name of the new job. The name must be a valid Abaqus/CAE object name.

type

A SymbolicConstant specifying the type of job. Possible values are ANALYSIS, SYNTAXCHECK, RECOVER, and RESTART. The default value is ANALYSIS.

If the object has the type *JobFromInputFile*, *type*=RESTART is not available.

waitHours

An Int specifying the number of hours to wait before submitting the job. This argument is ignored if *queue* is set. The default value is 0.

This argument works in conjunction with *waitMinutes*. *waitHours* and *atTime* are mutually exclusive.

waitMinutes

An Int specifying the number of minutes to wait before submitting the job. This argument is ignored if *queue* is set. The default value is 0.

This argument works in conjunction with *waitHours*. *waitMinutes* and *atTime* are mutually exclusive.

numCpus

An Int specifying the number of CPUs to use for this analysis if parallel processing is available. Possible values are *numCpus*> 0. The default value is 1.

memory

An Int specifying the amount of memory available to an Abaqus analysis. The value should be expressed in the units supplied in *memoryUnits*. The default value is 90.

memoryUnits

A SymbolicConstant specifying the units for the amount of memory used in an Abaqus analysis. Possible values are PERCENTAGE, MEGA_BYTES, and GIGA_BYTES. The default value is PERCENTAGE.

getMemoryFromAnalysis

A Boolean specifying whether to retrieve the recommended memory settings from the last datacheck or analysis run and use those values in subsequent submissions. The default value is ON.

explicitPrecision

A SymbolicConstant specifying whether to use the double precision version of Abaqus/Explicit. Possible values are SINGLE, FORCE_SINGLE, DOUBLE, DOUBLE_CONSTRAINT_ONLY, and DOUBLE_PLUS_PACK. The default value is SINGLE.

nodalOutputPrecision

A SymbolicConstant specifying the precision of the nodal output written to the output database. Possible values are SINGLE and FULL. The default value is SINGLE.

numDomains

An Int specifying the number of domains for parallel execution in Abaqus/Explicit. When using more than 1 *numCpus*, *numDomains* must be a multiple of *numCpus*. The default value is 1.

activateLoadBalancing

A Boolean specifying whether to activate dyanmic load balancing for jobs running on multiple processors with multiple domains in Abaqus/Explicit. The default value is OFF.

multiprocessingMode

A SymbolicConstant specifying whether an analysis is decomposed into threads or into multiple processes that communicate through a message passing interface (MPI). Possible values are DEFAULT, THREADS,MPI, and HYBRID. The default value is DEFAULT.

numThreadsPerMpiProcess

An Int specifying the number of threads per MPI process to use for this analysis if parallel processing is available. Possible values are *numThreadsPerMpiProcess*> 0. The default value is 1.

analysis

A SymbolicConstant specifying whether the job will be analyzed by Abaqus/Standard or Abaqus/Explicit. Possible values are STANDARD, EXPLICIT, and UNKNOWN.

If the object has the type *JobFromInputFile*, *analysis*=UNKNOWN.

status

A SymbolicConstant specifying the status of the analysis. Possible values are SUBMITTED, RUNNING, ABORTED, TERMINATED, COMPLETED, CHECK_RUNNING, and CHECK_COMPLETED.

If the *message* member is empty, *status* is set to NONE.

queue

A String specifying the name of the queue to which to submit the job. The default value is an empty string.

Note:

You can use the *queue* argument when creating a Job object on a Windows workstation; however, remote queues are available only on Linux platforms.

atTime

A String specifying the time at which to submit the job. If *queue* is empty, the string syntax must be valid for the Linux`at` command. If *queue* is set, the syntax must be valid according to the system administrator. The default value is an empty string.

Note:

You can use the *atTime* argument when creating a Job object on a Windows workstation; however, the `at` command is available only on Linux platforms.

scratch

A String specifying the location of the scratch directory. The default value is an empty string.

userSubroutine

A String specifying the file containing the user's subroutine definitions. The default value is an empty string.

messages

A *MessageArray* object specifying the messages received during an analysis.

environment

A tuple of Strings specifying the environment variables and their values.

licenseType

A SymbolicConstant specifying the type of license type being used in the case of the DSLS SimUnit license model. Possible values are DEFAULT, TOKEN, and CREDIT. The default value is DEFAULT.

If the license model is not the DSLS SimUnit, the licenseType is not available.

Corresponding analysis keywords

- **HEADING*
- **PREPRINT*

JobFromInputFile object

The JobFromInputFile object defines a *Job* object that analyzes a model contained in an input file.

The JobFromInputFile object is derived from the *Job* object.

Access

```
import job
mdb.jobs[name]
```

JobFromInputFile(...)

This method creates an analysis job using an input file for the model definition.

Path

```
mdb.JobFromInputFile
```

Required arguments

name

A String specifying the name of the new job. The name must be a valid Abaqus/CAE object name.

inputFileName

A String specifying the input file to read. Possible values are any valid file name. If the `.inp` extension is not included in the value of the argument, the system will append it for the user.

Optional arguments

type

A SymbolicConstant specifying the type of job. Possible values are ANALYSIS, SYNTAXCHECK, and RECOVER. The default value is ANALYSIS.

For theJobFromInputFile object, *type*=RESTART is not currently supported.

queue

A String specifying the name of the queue to which to submit the job. The default value is an empty string.

Note: You can use the *queue* argument when creating a Job object on a Windows workstation; however, remote queues are available only on Linux platforms.

waitHours

An Int specifying the number of hours to wait before submitting the job. This argument is ignored if *queue* is set. The default value is 0.

This argument works in conjunction with *waitMinutes*. *waitHours* and *atTime* are mutually exclusive.

waitMinutes

An Int specifying the number of minutes to wait before submitting the job. This argument is ignored if *queue* is set. The default value is 0.

This argument works in conjunction with *waitHours*. *waitMinutes* and *atTime* are mutually exclusive.

atTime

A String specifying the time at which to submit the job. If *queue* is empty, the string syntax must be valid for the Linux`at` command. If *queue* is set, the syntax must be valid according to the system administrator. The default value is an empty string.

Note: You can use the *atTime* argument when creating a Job object on a Windows workstation; however, the `at` command is available only on Linux platforms.

scratch

A String specifying the location of the scratch directory. The default value is an empty string.

userSubroutine

A String specifying the file containing the user's subroutine definitions. The default value is an empty string.

numCpus

An Int specifying the number of CPUs to use for this analysis if parallel processing is available. Possible values are *numCpus*> 0. The default value is 1.

memory

An Int specifying the amount of memory available to an Abaqus analysis. The value should be expressed in the units supplied in *memoryUnits*. The default value is 90.

memoryUnits

A SymbolicConstant specifying the units for the amount of memory used in an Abaqus analysis. Possible values are PERCENTAGE, MEGA_BYTES, and GIGA_BYTES. The default value is PERCENTAGE.

explicitPrecision

A SymbolicConstant specifying whether to use the double precision version of Abaqus/Explicit. Possible values are SINGLE, FORCE_SINGLE, DOUBLE, DOUBLE_CONSTRAINT_ONLY, and DOUBLE_PLUS_PACK. The default value is SINGLE.

nodalOutputPrecision

A SymbolicConstant specifying the precision of the nodal output written to the output database. Possible values are SINGLE and FULL. The default value is SINGLE.

numDomains

An Int specifying the number of domains for parallel execution in Abaqus/Explicit. When using more than 1 *numCpus*, *numDomains* must be a multiple of *numCpus*. The default value is 1.

activateLoadBalancing

A Boolean specifying whether to activate dyanmic load balancing for jobs running on multiple processors with multiple domains in Abaqus/Explicit. The default value is OFF.

multiprocessingMode

A SymbolicConstant specifying whether an analysis is decomposed into threads or into multiple processes that communicate through a message passing interface (MPI). Possible values are DEFAULT, THREADS, and MPI. The default value is DEFAULT.

licenseType

A SymbolicConstant specifying the type of license type being used in the case of the DSLS SimUnit license model. Possible values are DEFAULT, TOKEN, and CREDIT. The default value is DEFAULT.

If the license model is not the DSLS SimUnit, the licenseType is not available.

Return value

A JobFromInputFile object.

Exceptions

AbaqusException

ValueError

If the user attempts to provide RESTART as a value to argument type:	ValueError: RESTART of input file job is not currently supported.

`setValues(...)`

This method modifies the JobFromInputFile object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *JobFromInputFile* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The JobFromInputFile object has members with the same names and descriptions as the arguments to the *JobFromInputFile* method.

In addition, the JobFromInputFile object can have the following members:

getMemoryFromAnalysis	A Boolean specifying whether to retrieve the recommended memory settings from the last datacheck or analysis run and use those values in subsequent submissions. The default value is ON.
analysis	A SymbolicConstant specifying whether the job will be analyzed by Abaqus/Standard or Abaqus/Explicit. Possible values are STANDARD, EXPLICIT, and UNKNOWN. If the object has the type JobFromInputFile, *analysis*=UNKNOWN.
status	A SymbolicConstant specifying the status of the analysis. Possible values are SUBMITTED, RUNNING, ABORTED, TERMINATED, COMPLETED, CHECK_RUNNING, and CHECK_COMPLETED. If the *message* member is empty, *status* is set to NONE.

messages

A *MessageArray* object specifying the messages received during an analysis.

environment

A tuple of Strings specifying the environment variables and their values.

Message object

The Message object contains information about a given phase of the simulation. Job messages are not returned if a script is run without the Abaqus/CAE GUI (using the `noGUI` option).

Access

```
import job
mdb.coexecutions[name].jobs[name].messages[i]
mdb.jobs[name].messages[i]
```

Members

The Message object has the following members:

type

A SymbolicConstant specifying the type of message. Possible values are:

- ABORTED
- ANY_JOB
- ANY_MESSAGE_TYPE
- COMPLETED
- END_STEP
- ERROR
- HEADING
- HEALER_JOB
- HEALER_TYPE
- INTERRUPTED
- ITERATION
- JOB_ABORTED
- JOB_COMPLETED
- JOB_INTERRUPTED
- JOB_SUBMITTED
- MONITOR_DATA
- ODB_FILE
- ODB_FRAME
- STARTED
- STATE_FRAME
- STATUS
- STEP
- WARNING

data

A Dictionary object specifying the data returned by the analysis product. The value depends on the message returned. For a list of the possible entries, see the members of *DataObject*.

ModelJob object

The ModelJob object defines a *Job* object that analyzes a model on a model database (MDB).

The ModelJob object is derived from the *Job* object.

Access

```
import job
mdb.adaptivityProcesses[name].job
mdb.jobs[name]
```

Job(...)

This method creates an analysis job using a model on a model database (MDB) for the model definition.

Path

mdb.Job

Required arguments

name

A String specifying the name of the new job. The name must be a valid Abaqus/CAE object name.

model

A String specifying the name of the model to be analyzed or a Model object specifying the model to be analyzed.

Optional arguments

description

A String specifying a description of the job.

type

A SymbolicConstant specifying the type of job. Possible values are ANALYSIS, SYNTAXCHECK, RECOVER, and RESTART. The default value is ANALYSIS.

If the object has the type *JobFromInputFile*, *type*=RESTART is not available.

queue

A String specifying the name of the queue to which to submit the job. The default value is an empty string.

Note:

You can use the *queue* argument when creating a Job object on a Windows workstation; however, remote queues are available only on Linux platforms.

waitHours

An Int specifying the number of hours to wait before submitting the job. This argument is ignored if *queue* is set. The default value is 0.

This argument works in conjunction with *waitMinutes*. *waitHours* and *atTime* are mutually exclusive.

waitMinutes

An Int specifying the number of minutes to wait before submitting the job. This argument is ignored if *queue* is set. The default value is 0.

This argument works in conjunction with *waitHours*. *waitMinutes* and *atTime* are mutually exclusive.

atTime

A String specifying the time at which to submit the job. If *queue* is empty, the string syntax must be valid for the Linux`at` command. If *queue* is set, the syntax must be valid according to the system administrator. The default value is an empty string.

Note:

You can use the *atTime* argument when creating a Job object on a Windows workstation; however, the `at` command is available only on Linux platforms.

echoPrint

A Boolean specifying whether an echo of the input data is printed. The default value is OFF.

contactPrint

A Boolean specifying whether contact constraint data are printed. The default value is OFF.

modelPrint

A Boolean specifying whether model definition data are printed. The default value is OFF.

historyPrint

A Boolean specifying whether history data are printed. The default value is OFF.

scratch

A String specifying the location of the scratch directory. The default value is an empty string.

userSubroutine

A String specifying the file containing the user's subroutine definitions. The default value is an empty string.

numCpus

An Int specifying the number of CPUs to use for this analysis if parallel processing is available. Possible values are *numCpus*> 0. The default value is 1.

memory

An Int specifying the amount of memory available to an Abaqus analysis. The value should be expressed in the units supplied in *memoryUnits*. The default value is 90.

memoryUnits

A SymbolicConstant specifying the units for the amount of memory used in an Abaqus analysis. Possible values are PERCENTAGE, MEGA_BYTES, and GIGA_BYTES. The default value is PERCENTAGE.

explicitPrecision

A SymbolicConstant specifying whether to use the double precision version of Abaqus/Explicit. Possible values are SINGLE, FORCE_SINGLE, DOUBLE, DOUBLE_CONSTRAINT_ONLY, and DOUBLE_PLUS_PACK. The default value is SINGLE.

nodalOutputPrecision

A SymbolicConstant specifying the precision of the nodal output written to the output database. Possible values are SINGLE and FULL. The default value is SINGLE.

numDomains

An Int specifying the number of domains for parallel execution in Abaqus/Explicit. When using more than 1 *numCpus*, *numDomains* must be a multiple of *numCpus*. The default value is 1.

activateLoadBalancing A Boolean specifying whether to activate dyanmic load balancing for jobs running on multiple processors with multiple domains in Abaqus/Explicit. The default value is OFF.

multiprocessingMode A SymbolicConstant specifying whether an analysis is decomposed into threads or into multiple processes that communicate through a message passing interface (MPI). Possible values are DEFAULT, THREADS, and MPI. The default value is DEFAULT.

licenseType A SymbolicConstant specifying the type of license type being used in the case of the DSLS SimUnit license model. Possible values are DEFAULT, TOKEN, and CREDIT. The default value is DEFAULT.

If the license model is not the DSLS SimUnit, the licenseType is not available.

Return value

A ModelJob object.

Exceptions

AbaqusException.

`writeInput(...)`

This method writes an input file.

Required arguments

None.

Optional arguments

consistencyChecking A Boolean specifying whether to perform consistency checking for the job. The default value is ON. It is not recommended that you turn off the consistency checking unless you are absolutely sure that the model is consistent.

Return value

`None.`

Exceptions

None.

`setValues(...)`

This method modifies the ModelJob object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ModelJob* method.

Return value

`None.`

Exceptions

None.

Members

The ModelJob object can have the following members:

name

A String specifying the name of the new job. The name must be a valid Abaqus/CAE object name.

echoPrint

A Boolean specifying whether an echo of the input data is printed. The default value is OFF.

contactPrint

A Boolean specifying whether contact constraint data are printed. The default value is OFF.

modelPrint

A Boolean specifying whether model definition data are printed. The default value is OFF.

historyPrint

A Boolean specifying whether history data are printed. The default value is OFF.

model

A String specifying the name of the model to be analyzed or a Model object specifying the model to be analyzed.

description

A String specifying a description of the job.

type

A SymbolicConstant specifying the type of job. Possible values are ANALYSIS, SYNTAXCHECK, RECOVER, and RESTART. The default value is ANALYSIS.

If the object has the type *JobFromInputFile*, *type*=RESTART is not available.

waitHours

An Int specifying the number of hours to wait before submitting the job. This argument is ignored if *queue* is set. The default value is 0.

This argument works in conjunction with *waitMinutes*. *waitHours* and *atTime* are mutually exclusive.

waitMinutes

An Int specifying the number of minutes to wait before submitting the job. This argument is ignored if *queue* is set. The default value is 0.

This argument works in conjunction with *waitHours*. *waitMinutes* and *atTime* are mutually exclusive.

numCpus

An Int specifying the number of CPUs to use for this analysis if parallel processing is available. Possible values are *numCpus*> 0. The default value is 1.

memory

An Int specifying the amount of memory available to an Abaqus analysis. The value should be expressed in the units supplied in *memoryUnits*. The default value is 90.

memoryUnits

A SymbolicConstant specifying the units for the amount of memory used in an Abaqus analysis. Possible values are PERCENTAGE, MEGA_BYTES, and GIGA_BYTES. The default value is PERCENTAGE.

getMemoryFromAnalysis

A Boolean specifying whether to retrieve the recommended memory settings from the last datacheck or analysis run and use those values in subsequent submissions. The default value is ON.

explicitPrecision

A SymbolicConstant specifying whether to use the double precision version of Abaqus/Explicit. Possible values are SINGLE, FORCE_SINGLE, DOUBLE, DOUBLE_CONSTRAINT_ONLY, and DOUBLE_PLUS_PACK. The default value is SINGLE.

nodalOutputPrecision

A SymbolicConstant specifying the precision of the nodal output written to the output database. Possible values are SINGLE and FULL. The default value is SINGLE.

parallelizationMethodExplicit

A SymbolicConstant specifying the parallelization method for Abaqus/Explicit. This value is ignored for Abaqus/Standard. Possible values are DOMAIN and LOOP. The default value is DOMAIN.

numDomains

An Int specifying the number of domains for parallel execution in Abaqus/Explicit. When *parallelizationMethodExplicit*=DOMAIN, *numDomains* must be a multiple of *numCpus*. The default value is 1.

activateLoadBalancing

A Boolean specifying whether to activate dyanmic load balancing for jobs running on multiple processors with multiple domains in Abaqus/Explicit. The default value is OFF.

multiprocessingMode

A SymbolicConstant specifying whether an analysis is decomposed into threads or into multiple processes that communicate through a message passing interface (MPI). Possible values are DEFAULT, THREADS, and MPI. The default value is DEFAULT.

analysis

A SymbolicConstant specifying whether the job will be analyzed by Abaqus/Standard or Abaqus/Explicit. Possible values are STANDARD, EXPLICIT, and UNKNOWN.

If the object has the type *JobFromInputFile*, *analysis*=UNKNOWN.

status

A SymbolicConstant specifying the status of the analysis. Possible values are SUBMITTED, RUNNING, ABORTED, TERMINATED, COMPLETED, CHECK_RUNNING, and CHECK_COMPLETED.

If the *message* member is empty, *status* is set to NONE.

queue

A String specifying the name of the queue to which to submit the job. The default value is an empty string.

Note:

You can use the *queue* argument when creating a Job object on a Windows workstation; however, remote queues are available only on Linux platforms.

atTime

A String specifying the time at which to submit the job. If *queue* is empty, the string syntax must be valid for the Linux`at` command. If *queue* is set, the syntax must be valid according to the system administrator. The default value is an empty string.

Note:

You can use the *atTime* argument when creating a Job object on a Windows workstation; however, the `at` command is available only on Linux platforms.

scratch

A String specifying the location of the scratch directory. The default value is an empty string.

userSubroutine

A String specifying the file containing the user's subroutine definitions. The default value is an empty string.

messages

A *MessageArray* object specifying the messages received during an analysis.

environment

A tuple of Strings specifying the environment variables and their values.

Queue object

A Queue object tells the job where and how to submit a job remotely. A Queue object can be used as the *queue* argument to the `Job` method.

Access

```
import job
session.queues[name]
```

Queue(...)

This method creates a Queue object.

Note:

Remote queues are available only on Linux platforms.

Path

```
session.Queue
```

Required arguments

name	A String specifying the name of the new Queue object.
queueName	A String specifying the name of the remote analysis queue.

Optional arguments

hostName	A String specifying the name of the remote host. The default value is an empty string.
fileCopy	A Boolean specifying if the results files are to be copied from the remote machine to the local machine. The default value is ON.
directory	A String specifying the remote location for the execution of the simulation. The default value is an empty string.
driver	A String specifying the designation of the remote driver. The default value is "abaqus".
remotePlatform	A SymbolicConstant specifying the type of operating system on the remote machine. The default value is Linux.
filesToCopy	A list of Strings specifying the files to be copied from the remote location to the local machine, or ALL. Strings specified in a list are the extensions of the job files that will be copied, such as ('log', 'dat', 'msg', 'sta', 'odb'). The default value is ALL.
deleteAfterCopy	A Boolean specifying whether remote files are to be deleted after they are copied to the local machine. The default value is OFF.

description A String specifying a description of the queue. The default value is an empty string.

Return value

A Queue object.

Exceptions

If *fileCopy*=ON and *hostName* is empty: Remote queue host name is not set.

If *fileCopy*=ON and *directory* is empty: Directory in which to run the job on the remote computer is not set.

Members

The Queue object has members with the same names and descriptions as the arguments to the *Queue* method.

Coexecution object

The Coexecution object contains a set of jobs as associated parameters to define a co-simulation analysis.

Access

```
import job
mdb.coexecutions[name]
```

kill()

This method ends the analysis of a co-execution.

Arguments

None.

Return value

None.

Exceptions

None.

submit(...)

This method submits a co-execution for analysis.

Required arguments

None.

Optional arguments

consistencyChecking A Boolean specifying whether to perform consistency checking for the individual jobs. The default value is ON. It is not recommended to turn the consistency checking off unless you are absolutely sure the models are all consistent.

datacheckJob A Boolean specifying whether to run the co-execution as a datacheck analysis. The default value is False. The *datacheckJob* and *continueJob* arguments cannot both be True.

continueJob A Boolean specifying whether to run the co-execution as a continuation analysis. The default value is False. The *datacheckJob* and *continueJob* arguments cannot both be True.

Return value

None.

Exceptions

None.

writeInput(...)

This method writes an input file for each analysis in the co-execution.

Required arguments

None.

Optional arguments

consistencyChecking A Boolean specifying whether to perform consistency checking for the individual jobs. The default value is ON. It is not recommended to turn the consistency checking off unless you are absolutely sure the models are all consistent.

Return value

`None.`

Exceptions

None.

waitForCompletion()

This method interrupts the execution of the script until the end of all the analyses. If you call the `waitForCompletion` method and the *status* member is neither SUBMITTED nor RUNNING, Abaqus assumes the analysis has either completed or aborted and returns immediately.

Arguments

None.

Return value

`None.`

Exceptions

None.

Members

The Coexecution object can have the following members:

name A String specifying the name of the new job. The name must be a valid Abaqus/CAE object name.

type A SymbolicConstant specifying the type of analysis to execute for the co-execution. Possible values are ANALYSIS, SYNTAXCHECK, RECOVER, and RESTART. The default value is ANALYSIS.

mainAnalysisProduct A SymbolicConstant specifying the analysis product type of the main model for the co-execution. The default value is ABAQUS.

waitHours

An Int specifying the number of hours to wait before submitting the co-execution. This argument is ignored if *queue* is set. The default value is 0.

This argument works in conjunction with *waitMinutes*. *waitHours* and *atTime* are mutually exclusive.

waitMinutes

An Int specifying the number of minutes to wait before submitting the job. This argument is ignored if *queue* is set. The default value is 0.

This argument works in conjunction with *waitHours*. *waitMinutes* and *atTime* are mutually exclusive.

status

A SymbolicConstant specifying the status of the co-execution. Possible values are SUBMITTED, RUNNING, ABORTED, TERMINATED, COMPLETED, CHECK_SUBMITTED, CHECK_RUNNING, and CHECK_COMPLETED.

If the *message* member of all the jobs are empty, *status* is set to NONE.

queue

A String specifying the name of the queue to which to submit the co-execution. The default value is an empty string.

Note:

You can use the *queue* argument when creating a Coexecution object on a Windows workstation; however, remote queues are available only on Linux platforms.

atTime

A String specifying the time at which to submit the co-execution. If *queue* is empty, the string syntax must be valid for the Linux`at` command. If *queue* is set, the syntax must be valid according to the system administrator. The default value is an empty string.

Note:

You can use the *atTime* argument when creating a Coexecution object on a Windows workstation; however, the `at` command is available only on Linux platforms.

jobs

A repository of *Job* objects specifying the jobs that comprise this co-execution.

secondaryModels

A tuple of Strings specifying the names of the secondary models for the co-execution.

secondaryAnalysisProducts

A tuple of SymbolicConstants specifying the analysis product types of the secondary models for the co-execution. The default value is an empty sequence.

mainModel

A String specifying the name of the main model for the co-execution.

licenseType

A SymbolicConstant specifying the type of license type being used in case of DSLS SimUnit license model. Possible values are DEFAULT, TOKEN, and CREDIT. The default value is DEFAULT.

If the license model is not DSLS SimUnit then the licenseType is not available.

Corresponding analysis keywords

- *HEADING
- *PREPRINT

OptimizationProcess object

The OptimizationProcess object defines a process to perform an optimization of a model defined using an optimization task.

Access

```
import job
mdb.optimizationProcesses[name]
```

OptimizationProcess(...)

This method creates an OptimizationProcess object.

Path

```
mdb.OptimizationProcess
```

Required arguments

name A String specifying name of the optimization process.

model A String specifying name of the model to be used for the optimization process.

task A String specifying name of the optimization task to be used for the optimization process.

prototypeJob A String specifying name of the job to be used as the prototype for all analysis jobs run by the optimization process.

Optional arguments

description A String specifying a description of the optimization process.

maxDesignCycle An Int specifying the maximum number of allowed design cycles for the optimization process. The default value is 15.

dataSaveFrequency An Enum specifying whether Abaqus should save every iteration file in the optimization process or a selection of iteration files saved at a user-specified frequency. If you set *dataSaveFrequency*=OPT_DATASAVE_EVERY_CYCLE, Abaqus saves every iteration file; if you set *dataSaveFrequency*=OPT_DATASAVE_SPECIFY_CYCLE, Abaqus saves iteration files according to the frequency defined by the *saveEvery* parameter. The default value is OPT_DATASAVE_SPECIFY_CYCLE.

saveInitial A Boolean specifying whether the initial cycle should be saved when *dataSaveFrequency* is OPT_DATASAVE_SPECIFY_CYCLE. The default value is True.

saveFirst A Boolean specifying whether the first cycle should be saved when *dataSaveFrequency* is OPT_DATASAVE_SPECIFY_CYCLE. The default value is True.

saveLast
A Boolean specifying whether the last cycle should be saved when *dataSaveFrequency* is OPT_DATASAVE_SPECIFY_CYCLE. The default value is True.

saveEvery
An Int specifying every nth cycle iterations to be saved when *dataSaveFrequency* is OPT_DATASAVE_SPECIFY_CYCLE. Abaqus saves file iterations for every nth iteration after iteration 1; if you set *saveEvery*=3, Abaqus saves file iterations for cycles 1, 4, 7, and so on. The default value is None.

licenseType
A SymbolicConstant specifying the type of license type being used in the case of the DSLS SimUnit license model. Possible values are DEFAULT, TOKEN, and CREDIT. The default value is DEFAULT.

For optimization job submission, the licenseType options are available regardless of the license model.

Return value

An OptimizationProcess object.

Exceptions

AbaqusException.

writeParAndInputFiles()

This method allows you to write par and input files for an optimization task.

Arguments

None.

Return value

`None.`

Exceptions

None.

submit(...)

This method submits an optimization process.

Required arguments

None.

Optional arguments

validate
A Boolean specifying whether Abaqus should perform the validation of the optimization process only. The default value is False.

Return value
None.

Exceptions
None.

waitForCompletion()

This method interrupts the execution of the script until the end of all the analyses. If you call the `waitForCompletion` method and the *status* member is neither SUBMITTED nor RUNNING, Abaqus assumes the analysis has either completed or aborted and returns immediately.

Arguments
None.

Return value
None.

Exceptions
None.

extract(...)

This method extracts a surface mesh from the optimized model.

Required arguments

outputFileName	Name of the output file for the extracted surface mesh.
designCycle	The design cycle number for which the surface mesh should be extracted.

Optional arguments

isoValue	Value used to determine the positions on the element edges where the new nodes are created. Value between 0 and 1. The default value is 0.3.
smoothCycles	Number of smoothing cycles; if set to 0, no smoothing is performed. The default value is 5.
reductionPercent	Defines the percent of faces that should be removed during the data reduction. If set to 0, no data reduction occurs. If set to 100, the data reduction stops when no faces can be removed (that is checked using reductionAngle parameter). Value between 0 and 100. The default value is 0.
reductionAngle	Defines the maximal angle between adjacent faces at a node such that the node may be removed during the data reduction. Value in degrees between 0 and 90. The default value is15.

targetVolume Defines the target volume that is to be achieved iteratively by varying the isovalue. Value between 0 and 1. The default value is 0.

extractFormat A tuple for the types of format of the output. Possible values are OPT_EXTRACT_SMOOTH_ABAQUS_INPUT_FILE, OPT_EXTRACT_SMOOTH_STL, OPT_EXTRACT_SMOOTH_IGES1, OPT_EXTRACT_SMOOTH_IGES2, or OPT_EXTRACT_SMOOTH_IGES3. The default value is OPT_EXTRACT_SMOOTH_ABAQUS_INPUT_FILE.

resultFiltering Possible string values are OFF, MODERATE, or FULL. Defines if the element material values are to be filtered (averaged locally) before the isocut, and to what extent. The default value is OFF.

instances Defines a list of names of part instances to be used for surface extraction. One file (according to extractFormat) is created for each part instance. If the argument is not specified, no part instance is selected and surface is generated for the whole model.

Return value

`None.`

Exceptions

None.

`setValues(...)`

This method modifies the OptimizationProcess object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *OptimizationProcess* method, except for the *name* argument.

Return value

`None.`

Exceptions

None.

Members

The OptimizationProcess object has members with the same names and descriptions as the arguments to the *OptimizationProcess* method.

Load and Load Case commands

A specific type of load object and a specific type of load state object are designed for each type of load. A load object stores the non-propagating data of a load as well as a number of instances of the corresponding load state object, each of which stores the propagating data of the load in a single step. Instances of the load state object are created and deleted internally by its corresponding load object.

Load Case commands are used for configuring load cases in specific types of steps that may use them.

In this section:

- *Load object*
- *LoadCase object*
- *LoadState object*
- *BodyCharge object*
- *BodyChargeState object*
- *BodyConcentrationFlux object*
- *BodyConcentrationFluxState object*
- *BodyCurrent object*
- *BodyCurrentDensity object*
- *BodyCurrentState object*
- *BodyForce object*
- *BodyForceState object*
- *BodyHeatFlux object*
- *BodyHeatFluxState object*
- *BoltLoad object*

Load object

The Load object is the abstract base type for other Load objects. The Load object has no explicit constructor. The methods and members of the Load object are common to all objects derived from Load.

Access

```
import load
mdb.models[name].loads[name]
```

deactivate(...)

This method deactivates the load in the specified step and all its subsequent steps.

Required arguments

stepName	A String specifying the name of the step in which the load is deactivated.

Optional arguments

None.

Return value

None.

Exceptions

TextError.

move(...)

This method moves the load state object from one step to a different step.

Required arguments

fromStepName	A String specifying the name of the step from which the load state is moved.
toStepName	A String specifying the name of the step to which the load state is moved.

Optional arguments

None.

Return value

None.

Exceptions

TextError.

reset(...)

This method resets the load state of the specified step to the state of the previous general analysis step.

Required arguments

stepName	A String specifying the name of the step in which the load state is reset.

Optional arguments

None.

Return value

`None.`

Exceptions

TextError.

resume()

This method resumes the load that was previously suppressed.

Arguments

None.

Return value

`None.`

Exceptions

None.

suppress()

This method suppresses the load.

Arguments

None.

Return value

`None.`

Exceptions

None.

delete(...)

This method allows you to delete existing loads.

Required arguments

indices A sequence of Ints specifying the index of each load to delete.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

Members

The Load object can have the following members:

name A String specifying the load repository key.

region A *Region* object specifying the region to which the load is applied.

LoadCase object

The LoadCase object is used to define the loads and constraints comprising a particular loading condition and the linear response of a structure subjected to that loading condition.

Access

```
import step
mdb.models[name].steps[name].loadCases[name]
```

LoadCase(...)

This method creates a load case in a step.

Path

```
mdb.models[name].steps[name].LoadCase
```

Required arguments

name A String specifying the name of the object.

Optional arguments

boundaryConditions A sequence of (String, Float) sequences specifying the name of a BoundaryCondition followed by a nonzero Float scaling factor. The default value is an empty sequence.

loads A sequence of (String, Float) sequences specifying the name of a Load followed by a nonzero Float specifying a scale factor. The default value is an empty sequence.

includeActiveBaseStateBC A Boolean specifying whether to include all active boundary conditions propagated or modified from the base state. The default value is ON.

Return value

A LoadCase object.

Exceptions

RangeError.

resume()

This method resumes the load case that was previously suppressed.

Arguments

None.

Return value

```
None.
```

Exceptions

None.

suppress()

This method suppresses the load case.

Arguments

None.

Return value

`None.`

Exceptions

None.

setValues(...)

This method modifies the LoadCase object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *LoadCase* method, except for the *name* argument.

Return value

`None.`

Exceptions

RangeError.

Members

The LoadCase object has members with the same names and descriptions as the arguments to the *LoadCase* method.

In addition, the LoadCase object has the following member:

suppressed A Boolean specifying whether the load case is suppressed or not. The default value is OFF.

LoadState object

The LoadState object is the abstract base type for other LoadState objects. The LoadState object has no explicit constructor or methods. The members of the LoadState object are common to all objects derived from LoadState.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The LoadState object has the following members:

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the LoadState object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

BodyCharge object

The BodyCharge object stores the data for a body charge.

The BodyCharge object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

BodyCharge(...)

This method creates a BodyCharge object.

Path

```
mdb.models[name].BodyCharge
```

Required arguments

name	A String specifying the load repository key.
createStepName	A String specifying the name of the step in which the load is created. This must be the first analysis step name.
region	A *Region* object specifying the region to which the load is applied.
magnitude	A Float specifying the load magnitude.

Optional arguments

amplitude	A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.
distributionType	A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.
field	A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

Return value

A BodyCharge object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing BodyCharge object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *BodyCharge* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing BodyCharge object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

magnitude A Float specifying the load magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous static analysis step. FREED should be used if the load is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The BodyCharge object can have the following members:

name A String specifying the load repository key.

distributionType A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.

field A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

region A *Region* object specifying the region to which the load is applied.

BodyChargeState object

The BodyChargeState object stores the propagating data of a body charge in a step. One instance of this object is created internally by the *BodyCharge* object for each step. The instance is also deleted internally by the *BodyCharge* object.

The BodyChargeState object has no constructor or methods.

The BodyChargeState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The BodyChargeState object has the following members:

magnitude

A Float specifying the load magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the load magnitude. Possible values are UNSET, SET, UNCHANGED, and FREED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **DECHARGE* (load type label: EBF)

BodyConcentrationFlux object

The BodyConcentrationFlux object defines body concentration flux from a region or into a region.

The BodyConcentrationFlux object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

BodyConcentrationFlux(...)

This method creates a BodyConcentrationFlux object.

Path

```
mdb.models[name].BodyConcentrationFlux
```

Required arguments

name
A String specifying the load repository key.

createStepName
A String specifying the name of the step in which the load is created.

region
A *Region* object specifying the region to which the load is applied.

magnitude
A Float specifying the body concentration flux magnitude. *magnitude* is optional if *distributionType*=USER_DEFINED.

Optional arguments

field
A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

distributionType
A SymbolicConstant specifying how the body concentration flux is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

amplitude
A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

A BodyConcentrationFlux object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing BodyConcentrationFlux object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *BodyConcentrationFlux* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing BodyConcentrationFlux object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the Body heat flux is modified.

Optional arguments

magnitude A Float specifying the Body concentration flux magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the load has no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The BodyConcentrationFlux object can have the following members:

name A String specifying the load repository key.

distributionType

A SymbolicConstant specifying how the body concentration flux is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

field

A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

region

A *Region* object specifying the region to which the load is applied.

BodyConcentrationFluxState object

The BodyConcentrationFluxState object stores the propagating data for a *BodyConcentrationFlux* object in a step. One instance of this object is created internally by the *BodyConcentrationFlux* object for each step. The instance is also deleted internally by the *BodyConcentrationFlux* object.

The BodyConcentrationFluxState object has no constructor or methods.

The BodyConcentrationFluxState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The BodyConcentrationFluxState object has the following members:

magnitude

A Float specifying the body concentration flux magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the body concentration flux magnitude. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **CFLUX*

BodyCurrent object

The BodyCurrent object stores the data for a body current.

The BodyCurrent object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

BodyCurrent(...)

This method creates a BodyCurrent object.

Path

```
mdb.models[name].BodyCurrent
```

Required arguments

name	A String specifying the load repository key.
createStepName	A String specifying the name of the step in which the load is created. This must be the first analysis step name.
region	A *Region* object specifying the region to which the load is applied.
magnitude	A Float specifying the load magnitude.

Optional arguments

amplitude	A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.
distributionType	A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.
field	A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

Return value

A BodyCurrent object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing BodyCurrent object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *BodyCurrent* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing BodyCurrent object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

magnitude A Float specifying the load magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous static analysis step. FREED should be used if the load is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The BodyCurrent object can have the following members:

name A String specifying the load repository key.

distributionType A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.

field A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

region A *Region* object specifying the region to which the load is applied.

BodyCurrentDensity object

The BodyCurrentDensity object stores the data for a body current.

The BodyCurrentDensity object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

BodyCurrentDensity(...)

This method creates a BodyCurrentDensity object.

Path

```
mdb.models[name].BodyCurrentDensity
```

Required arguments

name	A String specifying the load repository key.
createStepName	A String specifying the name of the step in which the load is created. This must be the first analysis step name.
region	A *Region* object specifying the region to which the load is applied.
comp1	A Complex specifying the first component of the load.
comp2	A Complex specifying the second component of the load.
comp3	A Complex specifying the third component of the load.

Optional arguments

amplitude	A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.
distributionType	A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and USER_DEFINED. The default value is UNIFORM.

Return value

A BodyCurrentDensity object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing BodyCurrentDensity object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *BodyCurrentDensity* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing BodyCurrentDensity object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

comp1 A Complex specifying the first component of the load.

comp2 A Complex specifying the second component of the load.

comp3 A Complex specifying the third component of the load.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous static analysis step. FREED should be used if the load is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The BodyCurrentDensity object can have the following members:

name

A String specifying the load repository key.

distributionType

A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and USER_DEFINED. The default value is UNIFORM.

region

A *Region* object specifying the region to which the load is applied.

BodyCurrentState object

The BodyCurrentState object stores the propagating data of a body current in a step. One instance of this object is created internally by the *BodyCurrent* object for each step. The instance is also deleted internally by the *BodyCurrent* object.

The BodyCurrentState object has no constructor or methods.

The BodyCurrentState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The BodyCurrentState object has the following members:

magnitude

A Float specifying the load magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the load magnitude. Possible values are UNSET, SET, UNCHANGED, and FREED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **DECURRENT* (load type label: CBF)

BodyForce object

The BodyForce object defines a distributed load.

The BodyForce object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

BodyForce(...)

This method creates a BodyForce object.

Path

```
mdb.models[name].BodyForce
```

Required arguments

name A String specifying the load repository key.

createStepName A String specifying the name of the step in which the load is created.

region A *Region* object specifying the region to which the load is applied.

Optional arguments

field A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

distributionType A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

comp1 A Float or a Complex specifying the body force component in the 1-direction.

Note:

Although *comp1*, *comp2*, and *comp3* are optional arguments, at least one of them must be nonzero unless *distributionType*=USER_DEFINED.

comp2 A Float or a Complex specifying the body force component in the 2-direction.

comp3 A Float or a Complex specifying the body force component in the 3-direction.

amplitude A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

A BodyForce object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing BodyForce object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *BodyForce* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing BodyForce object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

comp1 A Float, a Complex, or the SymbolicConstant UNCHANGED specifying the body force component in the 1-direction. UNCHANGED should be used if the body force component is propagated from the previous analysis step.

comp2 A Float, a Complex, or the SymbolicConstant UNCHANGED specifying the body force component in the 2-direction. UNCHANGED should be used if the body force component is propagated from the previous analysis step.

comp3 A Float, a Complex, or the SymbolicConstant UNCHANGED specifying the body force component in the 3-direction. UNCHANGED should be used if the body force component is propagated from the previous analysis step.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the

amplitude is propagated from the previous analysis step. FREED should be used if the load is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

```
None.
```

Exceptions

None.

Members

The BodyForce object can have the following members:

name
A String specifying the load repository key.

distributionType
A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

field
A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

region
A *Region* object specifying the region to which the load is applied.

Corresponding analysis keywords

- **DLOAD* (load type label: BX, BY, BZ, BR, BXNU, BYNU, BZNU, or BRNU)

BodyForceState object

The BodyForceState object stores the propagating data of a body force in a step. One instance of this object is created internally by the *BodyForce* object for each step. The instance is also deleted internally by the *BodyForce* object.

The BodyForceState object has no constructor or methods.

The BodyForceState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The BodyForceState object has the following members:

comp1

A Float or a Complex specifying the body force component in the 1-direction.

comp2

A Float or a Complex specifying the body force component in the 2-direction.

comp3

A Float or a Complex specifying the body force component in the 3-direction.

comp1State

A SymbolicConstant specifying the propagation state of the body force component in the 1-direction. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

comp2State

A SymbolicConstant specifying the propagation state of the body force component in the 2-direction. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

comp3State

A SymbolicConstant specifying the propagation state of the body force component in the 3-direction. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **DLOAD* (load type label: BX, BY, BZ, BR, BXNU, BYNU, BZNU, or BRNU)

BodyHeatFlux object

The BodyHeatFlux object defines body heat flux from a region or into a region.

The BodyHeatFlux object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

BodyHeatFlux(...)

This method creates a BodyHeatFlux object.

Path

```
mdb.models[name].BodyHeatFlux
```

Required arguments

name	A String specifying the load repository key.
createStepName	A String specifying the name of the step in which the load is created.
region	A *Region* object specifying the region to which the load is applied.
magnitude	A Float specifying the body heat flux magnitude. *magnitude* is optional if *distributionType*=USER_DEFINED.

Optional arguments

field	A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.
distributionType	A SymbolicConstant specifying how the body heat flux is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.
amplitude	A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

A BodyHeatFlux object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing BodyHeatFlux object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *BodyHeatFlux* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing BodyHeatFlux object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the body heat flux is modified.

Optional arguments

magnitude A Float specifying the body heat flux magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the load has no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The BodyHeatFlux object can have the following members:

name A String specifying the load repository key.

distributionType A SymbolicConstant specifying how the body heat flux is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

field A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

region A *Region* object specifying the region to which the load is applied.

BodyHeatFluxState object

The BodyHeatFluxState object stores the propagating data for a Body *BodyHeatFlux* object in a step. One instance of this object is created internally by the *BodyHeatFlux* object for each step. The instance is also deleted internally by the *BodyHeatFlux* object.

The BodyHeatFluxState object has no constructor or methods.

The BodyHeatFluxState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The BodyHeatFluxState object has the following members:

magnitude

A Float specifying the Body heat flux magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the Body heat flux magnitude. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **DFLUX*

BoltLoad object

The BoltLoad object defines a bolt load.

The BoltLoad object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

BoltLoad(...)

This method creates a BoltLoad object.

Path

```
mdb.models[name].BoltLoad
```

Required arguments

name
A String specifying the load repository key.

createStepName
A String specifying the name of the step in which the load is created. This must be the first analysis step name.

region
A *Region* object specifying the region to which the load is applied.

magnitude
A Float specifying the bolt load magnitude.

Optional arguments

boltMethod
A SymbolicConstant specifying the method of applying the bolt load. Possible values are APPLY_FORCE and ADJUST_LENGTH. The default value is APPLY_FORCE.

datumAxis
A *DatumAxis* object specifying the orientation of the pre-tension section normal.

Note: *datumAxis* is applicable only for Solid and Shell regions; it has no meaning for Wire regions.

amplitude
A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

preTenSecPartLevel
A Boolean specifying whether the pre-tension section is to be defined at the part level. The default value is False. You should provide the *preTenSecPartLevel* argument only if the selected region belongs to a dependent part instance. A pre-tension section cannot be defined at the part level for independent and model instances.

Return value

A BoltLoad object.

Exceptions

TextError.

setValues(...)

This method modifies the data for an existing BoltLoad object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *BoltLoad* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing BoltLoad object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

boltMethod A SymbolicConstant specifying the type of bolt load. Possible values are APPLY_FORCE, ADJUST_LENGTH, and FIX_LENGTH. The default is APPLY_FORCE.

magnitude A Float specifying the bolt load magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the load is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The BoltLoad object can have the following members:

name

A String specifying the load repository key.

datumAxis

A *DatumAxis* object specifying the orientation of the pre-tension section normal.

Note:

datumAxis is required only for Solid and Shell regions; it has no meaning for Wire regions.

region

A *Region* object specifying the region to which the load is applied.

Corresponding analysis keywords

- **PRE-TENSION SECTION*
- **NODE* (for the reference node)
- **NSET* (for the reference node)

BoltLoadState object

The BoltLoadState object stores the propagating data of a bolt load in a step. One instance of this object is created internally by the *BoltLoad* object for each step. The instance is also deleted internally by the *BoltLoad* object.

The BoltLoadState object has no constructor or methods.

The BoltLoadState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The BoltLoadState object has the following members:

boltMethod

A SymbolicConstant specifying the type of bolt load. Possible values are APPLY_FORCE, ADJUST_LENGTH, and FIX_LENGTH.

boltMethodState

A SymbolicConstant specifying the propagation state of the bolt load type. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

magnitude

A Float specifying the bolt load magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the bolt load magnitude. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **CLOAD* (when *boltMethod*=APPLY_FORCE)
- **BOUNDARY* (when *boltMethod*=ADJUST_LENGTH or FIX_LENGTH)

ConcCharge object

The ConcCharge object stores the data for a concentrated charge.

The ConcCharge object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

ConcCharge(...)

This method creates a ConcCharge object.

Path

```
mdb.models[name].ConcCharge
```

Required arguments

name	A String specifying the load repository key.
createStepName	A String specifying the name of the step in which the load is created. This must be the first analysis step name.
region	A *Region* object specifying the region to which the load is applied.
magnitude	A Float specifying the load magnitude.

Optional arguments

distributionType	A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.
field	A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.
amplitude	A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

A ConcCharge object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing ConcCharge object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConcCharge* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing ConcCharge object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

magnitude A Float specifying the load magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous static analysis step. FREED should be used if the load is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The ConcCharge object can have the following members:

name A String specifying the load repository key.

distributionType

A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.

field

A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

region

A *Region* object specifying the region to which the load is applied.

ConcConcFlux object

The ConcConcFlux object stores the data for a concentrated concentration flux.

The ConcConcFlux object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

ConcConcFlux(...)

This method creates a ConcConcFlux object.

Path

```
mdb.models[name].ConcConcFlux
```

Required arguments

name	A String specifying the load repository key.
createStepName	A String specifying the name of the step in which the load is created. This must be the first analysis step name.
region	A *Region* object specifying the region to which the load is applied.
magnitude	A Float specifying the load magnitude.

Optional arguments

distributionType	A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.
field	A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.
amplitude	A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

A ConcConcFlux object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing ConcConcFlux object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConcConcFlux* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing ConcConcFlux object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

magnitude A Float specifying the load magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous static analysis step. FREED should be used if the load is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The ConcConcFlux object can have the following members:

name A String specifying the load repository key.

distributionType

A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.

field

A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

region

A *Region* object specifying the region to which the load is applied.

ConcCurrent object

The ConcCurrent object stores the data for a concentrated current.

The ConcCurrent object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

ConcCurrent(...)

This method creates a ConcCurrent object.

Path

```
mdb.models[name].ConcCurrent
```

Required arguments

name	A String specifying the load repository key.
createStepName	A String specifying the name of the step in which the load is created. This must be the first analysis step name.
region	A *Region* object specifying the region to which the load is applied.
magnitude	A Float specifying the load magnitude.

Optional arguments

distributionType	A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.
field	A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.
amplitude	A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

A ConcCurrent object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing ConcCurrent object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConcCurrent* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing ConcCurrent object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

magnitude A Float specifying the load magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous static analysis step. FREED should be used if the load is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The ConcCurrent object can have the following members:

name A String specifying the load repository key.

distributionType A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.

field A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

region A *Region* object specifying the region to which the load is applied.

ConcCurrentState object

The ConcCurrentState object stores the propagating data of a concentrated current in a step. One instance of this object is created internally by the *ConcCurrent* object for each step. The instance is also deleted internally by the *ConcCurrent* object.

The ConcCurrentState object has no constructor or methods.

The ConcCurrentState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The ConcCurrentState object has the following members:

magnitude

A Float specifying the load magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the load magnitude. Possible values are UNSET, SET, UNCHANGED, and FREED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **CECURRENT*

ConcentratedChargeState object

The ConcentratedChargeState object stores the propagating data of a concentrated charge in a step. One instance of this object is created internally by the *ConcCharge* object for each step. The instance is also deleted internally by the *ConcCharge* object.

The ConcentratedChargeState object has no constructor or methods.

The ConcentratedChargeState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The ConcentratedChargeState object has the following members:

magnitude

A Float specifying the load magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the load magnitude. Possible values are UNSET, SET, UNCHANGED, and FREED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **CECHARGE*

ConcentratedConcentrationFluxState object

The ConcentratedConcentrationFluxState object stores the propagating data of a concentrated concentration flux in a step. One instance of this object is created internally by the *ConcConcFlux* object for each step. The instance is also deleted internally by the *ConcConcFlux* object.

The ConcentratedConcentrationFluxState object has no constructor or methods.

The ConcentratedConcentrationFluxState object is derived from the *LoadState* object.

Access

```

Members

The ConcentratedConcentrationFluxState object has the following members:

magnitude

A Float specifying the load magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the load magnitude. Possible values are UNSET, SET, UNCHANGED, and FREED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **CFLUX* (degree of freedom: 11, which is assumed)

ConcentratedForce object

The ConcentratedForce object defines a concentrated force.

The ConcentratedForce object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

ConcentratedForce(...)

This method creates a ConcentratedForce object.

Path

```
mdb.models[name].ConcentratedForce
```

Required arguments

name A String specifying the load repository key.

createStepName A String specifying the name of the step in which the load is created.

region A *Region* object specifying the region to which the load is applied.

Optional arguments

distributionType A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.

field A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

cf1 A Float or a Complex specifying the concentrated force component in the 1-direction. Although *cf1*, *cf2*, and *cf3* are optional arguments, at least one of them must be nonzero.

cf2 A Float or a Complex specifying the concentrated force component in the 2-direction.

cf3 A Float or a Complex specifying the concentrated force component in the 3-direction.

amplitude A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

follower A Boolean specifying whether the direction of the force rotates with the rotation at each node of the region. You should provide the *follower* argument only if it is valid for the specified step. The default value is OFF.

localCsys `None` or a *DatumCsys* object specifying the local coordinate system of the load's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. When this member is queried, it returns an Int. The default value is `None`.

Return value

A ConcentratedForce object.

Exceptions

None.

`setValues(...)`

This method modifies the data for an existing ConcentratedForce object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConcentratedForce* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing ConcentratedForce object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

cf1 A Float, a Complex, or the SymbolicConstant UNCHANGED specifying the concentrated force component in the 1-direction. UNCHANGED should be used if the concentrated force component is propagated from the previous analysis step.

cf2 A Float, a Complex, or the SymbolicConstant UNCHANGED specifying the concentrated force component in the 2-direction. UNCHANGED should be used if the concentrated force component is propagated from the previous analysis step.

cf3
A Float, a Complex, or the SymbolicConstant UNCHANGED specifying the concentrated force component in the 3-direction. UNCHANGED should be used if the concentrated force component is propagated from the previous analysis step.

amplitude
A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the load is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value
`None`.

Exceptions
None.

Members
The ConcentratedForce object can have the following members:

name
A String specifying the load repository key.

distributionType
A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.

follower
A Boolean specifying whether the direction of the force rotates with the rotation at each node of the region. You should provide the *follower* argument only if it is valid for the specified step. The default value is OFF.

localCsys
`None` or a *DatumCsys* object specifying the local coordinate system of the load's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system. When this member is queried, it returns an Int. The default value is `None`.

field
A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

region
A *Region* object specifying the region to which the load is applied.

ConcentratedForceState object

The ConcentratedForceState object stores the propagating data for a concentrated force in a step. One instance of this object is created internally by the *ConcentratedForce* object for each step. The instance is also deleted internally by the *ConcentratedForce* object.

The ConcentratedForceState object has no constructor or methods.

The ConcentratedForceState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The ConcentratedForceState object has the following members:

cf1

A Float or a Complex specifying the concentrated force component in the 1-direction. Although *cf1*, *cf2*, and *cf3* are optional arguments, at least one of them must be nonzero.

cf2

A Float or a Complex specifying the concentrated force component in the 2-direction.

cf3

A Float or a Complex specifying the concentrated force component in the 3-direction.

cf1State

A SymbolicConstant specifying the propagation state of the concentrated force component in the 1-direction. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

cf2State

A SymbolicConstant specifying the propagation state of the concentrated force component in the 2-direction. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

cf3State

A SymbolicConstant specifying the propagation state of the concentrated force component in the 3-direction. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE

- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **CLOAD* (degree of freedom: 1, 2, or 3)

ConcentratedHeatFlux object

The ConcentratedHeatFlux object stores the data for a concentrated heat flux load.

The ConcentratedHeatFlux object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

ConcentratedHeatFlux(...)

This method creates a ConcentratedHeatFlux object.

Path

```
mdb.models[name].ConcentratedHeatFlux
```

Required arguments

name	A String specifying the load repository key.
createStepName	A String specifying the name of the step in which the load is created. This must be the first analysis step name.
region	A *Region* object specifying the region to which the load is applied.
magnitude	A Float specifying the load magnitude.

Optional arguments

distributionType	A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.
field	A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.
amplitude	A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.
dof	An Int specifying the degree of freedom of the node, to which the concentrated heat flux should be applied. The default value is 11.

Return value

A ConcentratedHeatFlux object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing ConcentratedHeatFlux object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConcentratedHeatFlux* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing ConcentratedHeatFlux object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

magnitude A Float specifying the load magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous static analysis step. FREED should be used if the load is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The ConcentratedHeatFlux object can have the following members:

name

A String specifying the load repository key.

distributionType

A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.

dof

An Int specifying the degree of freedom of the node, to which the concentrated heat flux should be applied. The default value is 11.

field

A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

region

A *Region* object specifying the region to which the load is applied.

ConcentratedHeatFluxState object

The ConcentratedHeatFluxState object stores the propagating data of a concentrated heat flux load in a step. One instance of this object is created internally by the *ConcentratedHeatFlux* object for each step. The instance is also deleted internally by the *ConcentratedHeatFlux* object.

The ConcentratedHeatFluxState object has no constructor or methods.

The ConcentratedHeatFluxState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The ConcentratedHeatFluxState object has the following members:

magnitude

A Float specifying the load magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the load magnitude. Possible values are UNSET, SET, UNCHANGED, and FREED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **CFLUX* (degree of freedom: one out of integers 11 to 31)

ConcentratedPoreFluidState object

The ConcentratedPoreFluidState object stores the propagating data of a concentrated pore fluid flow load in a step. One instance of this object is created internally by the *ConcPoreFluid* object for each step. The instance is also deleted internally by the *ConcPoreFluid* object.

The ConcentratedPoreFluidState object has no constructor or methods.

The ConcentratedPoreFluidState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The ConcentratedPoreFluidState object has the following members:

magnitude

A Float specifying the load magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the load magnitude. Possible values are UNSET, SET, UNCHANGED, and FREED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **CLOAD* (degree of freedom: 8)

ConcPoreFluid object

The ConcPoreFluid object stores the data for a concentrated pore fluid flow load.

The ConcPoreFluid object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

ConcPoreFluid(...)

This method creates a ConcPoreFluid object.

Path

```
mdb.models[name].ConcPoreFluid
```

Required arguments

name	A String specifying the load repository key.
createStepName	A String specifying the name of the step in which the load is created. This must be the first analysis step name.
region	A *Region* object specifying the region to which the load is applied.
magnitude	A Float specifying the load magnitude.

Optional arguments

distributionType	A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.
field	A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.
amplitude	A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

A ConcPoreFluid object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing ConcPoreFluid object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConcPoreFluid* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing ConcPoreFluid object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

magnitude A Float specifying the load magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous static analysis step. FREED should be used if the load is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The ConcPoreFluid object can have the following members:

name A String specifying the load repository key.

distributionType A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.

field A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

region A *Region* object specifying the region to which the load is applied.

ConnectorForce object

The ConnectorForce object defines a connector force.

The ConnectorForce object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

ConnectorForce(...)

This method creates a ConnectorForce object on a wire region. Alternatively, the load may also be applied to a wire set referenced from an assembled fastener template model.

Path

```
mdb.models[name].ConnectorForce
```

Required arguments

name
A String specifying the load repository key.

createStepName
A String specifying the name of the step in which the load is created.

Optional arguments

region
The wire region to which the load is applied. This argument is not valid when *fastenerName* and *fastenerSetName* are specified.

fastenerName
A String specifying the name of the assembled fastener to which the load will be applied. This argument is not valid when *region* is specified. When this argument is specified, *fastenerSetName* must also be specified. The default value is an empty string.

fastenerSetName
A String specifying the assembled fastener template model set to which the load will be applied. This argument is not valid when *region* is specified. When this argument is specified, *fastenerName* must also be specified. The default value is an empty string.

f1
A Float or a Complex specifying the connector force component in the connector's local 1-direction.

Note:

Although *f1*, *f2*, and *f3* are optional arguments, at least one of them must be nonzero.

f2
A Float or a Complex specifying the connector force component in the connector's local 2-direction.

f3
A Float or a Complex specifying the connector force component in the connector's local 3-direction.

amplitude
A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

A ConnectorForce object.

Exceptions

None.

`setValues(...)`

This method modifies the data for an existing ConnectorForce object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConnectorForce* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing ConnectorForce object in the specified step.

Required arguments

stepName
A String specifying the name of the step in which the load is modified.

Optional arguments

f1
A Float, a Complex, or the SymbolicConstant UNCHANGED specifying the connector force component in the connector's local 1-direction. UNCHANGED should be used if the connector force component is propagated from the previous analysis step.

f2
A Float, a Complex, or the SymbolicConstant UNCHANGED specifying the connector force component in the connector's local 2-direction. UNCHANGED should be used if the connector force component is propagated from the previous analysis step.

f3
A Float, a Complex, or the SymbolicConstant UNCHANGED specifying the connector force component in the connector's local 3-direction. UNCHANGED should be used if the connector force component is propagated from the previous analysis step.

amplitude
A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the load is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value
`None.`

Exceptions
None.

Members
The ConnectorForce object can have the following members:

name
A String specifying the load repository key.

fastenerName
A String specifying the name of the assembled fastener to which the load will be applied. This argument is not valid when *region* is specified. When this argument is specified, *fastenerSetName* must also be specified. The default value is an empty string.

fastenerSetName
A String specifying the assembled fastener template model set to which the load will be applied. This argument is not valid when *region* is specified. When this argument is specified, *fastenerName* must also be specified. The default value is an empty string.

region
A *Region* object specifying the region to which the load is applied.

ConnectorForceState object

The ConnectorForceState object stores the propagating data for a connector force in a step. One instance of this object is created internally by the *ConnectorForce* object for each step. The instance is also deleted internally by the *ConnectorForce* object.

The ConnectorForceState object has no constructor or methods.

The ConnectorForceState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The ConnectorForceState object has the following members:

f1

A Float or a Complex specifying the connector force component in the connector's local 1-direction.

f2

A Float or a Complex specifying the connector force component in the connector's local 2-direction.

f3

A Float or a Complex specifying the connector force component in the connector's local 3-direction.

f1State

A SymbolicConstant specifying the propagation state of the connector force component in the connector's local 1-direction. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

f2State

A SymbolicConstant specifying the propagation state of the connector force component in the connector's local 2-direction. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

f3State

A SymbolicConstant specifying the propagation state of the connector force component in the connector's local 3-direction. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **CONNECTOR LOAD* (degree of freedom: 1, 2, or 3)

ConnectorMoment object

The ConnectorMoment object stores the data for a connector moment.

The ConnectorMoment object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

ConnectorMoment(...)

This method creates a ConnectorMoment object on a wire region. Alternatively, the load may also be applied to a wire set referenced from an assembled fastener template model.

Path

```
mdb.models[name].ConnectorMoment
```

Required arguments

name	A String specifying the load repository key.
createStepName	A String specifying the name of the step in which the load is created.

Optional arguments

region	The wire region to which the load is applied. This argument is not valid when *fastenerName* and *fastenerSetName* are specified.
fastenerName	A String specifying the name of the assembled fastener to which the load will be applied. This argument is not valid when *region* is specified. When this argument is specified, *fastenerSetName* must also be specified. The default value is an empty string.
fastenerSetName	A String specifying the assembled fastener template model set to which the load will be applied. This argument is not valid when *region* is specified. When this argument is specified, *fastenerName* must also be specified. The default value is an empty string.
m1	A Float or a Complex specifying the moment component in the connector's local 4-direction.
m2	A Float or a Complex specifying the moment component in the connector's local 5-direction.
m3	A Float or a Complex specifying the moment component in the connector's local 6-direction.
amplitude	A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

A ConnectorMoment object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing ConnectorMoment object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConnectorMoment* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing ConnectorMoment object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

m1 A Float, a Complex, or a SymbolicConstant specifying the moment component in the connector's local 4-direction. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the load component is propagated from the previous static analysis step. Use FREED to remove a previously defined load component.

m2 A Float, a Complex, or a SymbolicConstant specifying the moment component in the connector's local 5-direction. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the load component is propagated from the previous static analysis step. Use FREED to remove a previously defined load component.

m3 A Float, a Complex, or a SymbolicConstant specifying the moment component in the connector's local 6-direction. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the load component is propagated from the previous static analysis step. Use FREED to remove a previously defined load component.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous static analysis step. FREED should be used if the load is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The ConnectorMoment object can have the following members:

name A String specifying the load repository key.

fastenerName A String specifying the name of the assembled fastener to which the load will be applied. This argument is not valid when *region* is specified. When this argument is specified, *fastenerSetName* must also be specified. The default value is an empty string.

fastenerSetName A String specifying the assembled fastener template model set to which the load will be applied. This argument is not valid when *region* is specified. When this argument is specified, *fastenerName* must also be specified. The default value is an empty string.

region A *Region* object specifying the region to which the load is applied.

ConnectorMomentState object

The ConnectorMomentState object stores the propagating data for a connector moment in a step. One instance of this object is created internally by the *ConnectorMoment* object for each step. The instance is also deleted internally by the *ConnectorMoment* object.

The ConnectorMomentState object has no constructor or methods.

The ConnectorMomentState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The ConnectorMomentState object has the following members:

m1

A Float or a Complex specifying the connector moment component in the connector's local 4-direction. Although *m1*, *m2*, and *m3* are optional arguments, at least one of them must be nonzero.

m2

A Float or a Complex specifying the connector moment component in the connector's local 5direction.

m3

A Float or a Complex specifying the connector moment component in the connector's local 6-direction.

m1State

A SymbolicConstant specifying the propagation state of the load component in the connector's local 4-direction. Possible values are UNSET, SET, UNCHANGED, and FREED.

m2State

A SymbolicConstant specifying the propagation state of the load component in the connector's local 5-direction. Possible values are UNSET, SET, UNCHANGED, and FREED.

m3State

A SymbolicConstant specifying the propagation state of the load component in the connector's local 6-direction. Possible values are UNSET, SET, UNCHANGED, and FREED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE

- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **CONNECTOR LOAD* (degree of freedom: 4, 5, or 6)

CoriolisForce object

The CoriolisForce object stores the data for a coriolis force.

The CoriolisForce object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

CoriolisForce(...)

This method creates a CoriolisForce object.

Path

```
mdb.models[name].CoriolisForce
```

Required arguments

name	A String specifying the load repository key.
createStepName	A String specifying the name of the step in which the load is created. This must be the first analysis step name.
region	A *Region* object specifying the region to which the load is applied.
magnitude	A Float specifying the load magnitude.
point1	A sequence of Floats specifying the first point on the axis of rotation for the load.
point2	A sequence of Floats specifying the second point on the axis of rotation for the load.

Optional arguments

amplitude	A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.
distributionType	A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.
field	A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

Return value

A CoriolisForce object.

Exceptions

None.

`setValues(...)`

This method modifies the data for an existing CoriolisForce object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *CoriolisForce* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing CoriolisForce object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

magnitude A Float specifying the load magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous static analysis step. FREED should be used if the load is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The CoriolisForce object can have the following members:

name
A String specifying the load repository key.

distributionType
A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.

point1
A tuple of Floats specifying the first point on the axis of rotation for the load.

point2
A tuple of Floats specifying the second point on the axis of rotation for the load.

field
A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

region
A *Region* object specifying the region to which the load is applied.

CoriolisForceState object

The CoriolisForceState object stores the propagating data of a coriolis force in a step. One instance of this object is created internally by the *CoriolisForce* object for each step. The instance is also deleted internally by the *CoriolisForce* object.

The CoriolisForceState object has no constructor or methods.

The CoriolisForceState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The CoriolisForceState object has the following members:

magnitude

A Float specifying the load magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the load magnitude. Possible values are UNSET, SET, UNCHANGED, and FREED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **DLOAD* (load type label: CORIO)

DistIonConcBodyFlux object

The DistIonConcBodyFlux object defines distributed ion concentration body flux from a region or into a region.

The DistIonConcBodyFlux object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

DistIonConcBodyFlux(...)

This method creates a DistIonConcBodyFlux object.

Path

```
mdb.models[name].DistIonConcBodyFlux
```

Required arguments

name	A String specifying the load repository key.
createStepName	A String specifying the name of the step in which the load is created.
region	A *Region* object specifying the region to which the load is applied.
magnitude	A Float specifying the body heat flux magnitude. *magnitude* is optional if *distributionType* is USER_DEFINED.

Optional arguments

field	A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType* is FIELD. The default value is an empty string.
distributionType	A SymbolicConstant specifying how the distributed ion concentration body flux is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.
amplitude	A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

A DistIonConcBodyFlux object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing DistIonConcBodyFlux object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *DistIonConcBodyFlux* method, except for the *name* and *createStepName* arguments.

Return value

```
None.
```

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing DistIonConcBodyFlux object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the body heat flux is modified.

Optional arguments

magnitude A Float specifying the body heat flux magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the load has no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

```
None.
```

Exceptions

None.

Members

The DistIonConcBodyFlux object can have the following members:

name A String specifying the load repository key.

distributionType

A SymbolicConstant specifying how the distributed ion concentration body flux is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

field

A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType* = FIELD. The default value is an empty string.

region

A *Region* object specifying the region to which the load is applied.

DistIonConcBodyFluxState object

The DistIonConcBodyFluxState object stores the propagating data for a DistIonConcBodyFlux object in a step. One instance of this object is created internally by the *DistIonConcBodyFlux* object for each step. The instance is also deleted internally by the *DistIonConcBodyFlux* object.

The DistIonConcBodyFluxState object has no constructor or methods.

The DistIonConcBodyFluxState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The DistIonConcBodyFluxState object has the following members:

magnitude

A Float specifying the distributed ion concentration body flux magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the distributed ion concentration body flux magnitude. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **DFLUX*

FluidPressurePenetration object

The FluidPressurePenetration object defines a fluid pressure penetration load.

The FluidPressurePenetration object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

FluidPressurePenetration(...)

This method creates a FluidPressurePenetration object.

Path

```
mdb.models[name].FluidPressurePenetration
```

Required arguments

name A String specifying the load repository key.

createStepName A String specifying the name of the step in which the pressure is created.

region A *Region* object specifying the region to which the load is applied.

magnitude A Float specifying the fluid pressure magnitude.

Optional arguments

amplitude A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

criticalPressure A Float specifying the critical contact interface pressure threshold at which fluid penetration starts to occur. The default value is 0.0.

timePeriod A Float specifying the time period over which the fluid pressure on the newly penetrated contact surface segments is ramped up to the current magnitude. The *timePeriod* argument applies only in Abaqus/Standard and is neglected in the linear perturbation analysis. The default value is 0.001.

evolutionRegionMethod A SymbolicConstant LOCAL or WETTING_ADVANCE used for specifying the algorithm to control the evolution of the region exposed to the fluid pressure. The *evolutionRegionMethod* argument applies WETTING_ADVANCE only in an Abaqus/Explicit analysis. The default value is LOCAL.

wettedRegion A *Region* object specifying the node or node set on the surface initially exposed to fluid pressure. The *wettedRegion* argument applies only when the *evolutionRegionMethod* argument has the value WETTING_ADVANCE.

Return value

A FluidPressurePenetration object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing FluidPressurePenetration object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Pressure* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing Pressure object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

magnitude A Float specifying the fluid pressure magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the load has no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

criticalPressure A Float specifying the critical contact interface pressure threshold at which fluid penetration starts to occur. The default value is 0.0.

timePeriod A Float specifying the time period over which the fluid pressure on the newly penetrated contact surface segments is ramped up to the current magnitude. The *timePeriod* argument applies only in Abaqus/Standard and is neglected in the linear perturbation analysis. The default value is 0.001.

evolutionRegionMethod A SymbolicConstant LOCAL or WETTING_ADVANCE used for specifying the algorithm to control the evolution of the region exposed to the fluid pressure. The *evolutionRegionMethod* argument applies WETTING_ADVANCE only in an Abaqus/Explicit analysis. The default value is LOCAL.

wettedRegion A *Region* object specifying the node or node set on the surface initially exposed to fluid pressure. The *wettedRegion* argument applies only when the *evolutionRegionMethod* argument has the value WETTING_ADVANCE.

Return value

`None.`

Exceptions

None.

Members

The Pressure object can have the following members:

name A String specifying the load repository key.

region A *Region* object specifying the region to which the load is applied.

FluidPressurePenetrationState object

The FluidPressurePenetrationState object stores the propagating data for a pressure in a step.
One instance of this object is created internally by the *FluidPressurePenetration* object for each step. The instance is also deleted internally by the *FluidPressurePenetration* object.

The FluidPressurePenetrationState object has no constructor or methods.

The FluidPressurePenetrationState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The FluidPressurePenetrationState object has the following members:

magnitude
A Float specifying the pressure magnitude.

magnitudeState
A SymbolicConstant specifying the propagation state of the pressure magnitude. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

amplitude
A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

amplitudeState
A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

criticalPressure
A Float specifying the critical contact interface pressure threshold at which fluid penetration starts to occur. The default value is 0.0.

criticalPressureState
A SymbolicConstant specifying the propagation state of the criticalPressure member. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

timePeriod
A Float specifying the time period over which the fluid pressure on the newly penetrated contact surface segments is ramped up to the current magnitude. The *timePeriod* argument applies only in *Abaqus/Standard* and is neglected in the linear perturbation analysis. The default value is 0.001.

timePeriodState
A SymbolicConstant specifying the propagation state of the timePeriod member. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

evolutionRegionMethod
A SymbolicConstant LOCAL or WETTING_ADVANCE used for specifying the algorithm to control the evolution of the region exposed to the fluid pressure. The *evolutionRegionMethod* argument applies WETTING_ADVANCE only in an *Abaqus/Explicit* analysis. The default value is LOCAL.

evolutionRegionMethodState
A SymbolicConstant specifying the propagation state of the evolutionRegionMethod member. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

wettedRegion
A *Region* object specifying the node or node set on the surface initially exposed to fluid pressure. The *wettedRegion* argument applies only when the *evolutionRegionMethod* argument has the value WETTING_ADVANCE.

wettedRegionState
A SymbolicConstant specifying the propagation state of the wettedRegion member. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

status
A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

Corresponding analysis keywords

- **DSLOAD*
- **DLOAD*

FluidSurfaceCurrent object

The FluidSurfaceCurrent object stores the data for a fluid surface current.

The FluidSurfaceCurrent object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

FluidSurfaceCurrent(...)

This method creates a FluidSurfaceCurrent object.

Path

```
mdb.models[name].FluidSurfaceCurrent
```

Required arguments

name	A String specifying the load repository key.
createStepName	A String specifying the name of the step in which the load is created. This must be the first analysis step name.
region	A *Region* object specifying the region to which the load is applied.
magnitude	A Float specifying the load magnitude.

Optional arguments

distributionType	A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.
field	A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType* is FIELD. The default value is an empty string.
amplitude	A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

A FluidSurfaceCurrent object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing FluidSurfaceCurrent object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *FluidSurfaceCurrent* method, except for the *name* and *createStepName* arguments.

Return value

```
None.
```

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing FluidSurfaceCurrent object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

magnitude A Float specifying the load magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous static analysis step. FREED should be used if the load is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

```
None.
```

Exceptions

None.

Members

The FluidSurfaceCurrent object can have the following members:

name A String specifying the load repository key.

distributionType A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.

field A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType* is FIELD. The default value is an empty string.

region A *Region* object specifying the region to which the load is applied.

FluidSurfaceCurrentState object

The FluidSurfaceCurrentState object stores the propagating data of a surface current in a step.
One instance of this object is created internally by the *FluidSurfaceCurrent* object for each step. The instance is also deleted internally by the *FluidSurfaceCurrent* object.

The FluidSurfaceCurrentState object has no constructor or methods.

The FluidSurfaceCurrentState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The FluidSurfaceCurrentState object has the following members:

magnitude

A Float specifying the load magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the load magnitude. Possible values are UNSET, SET, UNCHANGED, and FREED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **DSECURRENT* (load type label: ECS)

Gravity object

The Gravity object stores the data of a gravity load.

The Gravity object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

Gravity(...)

This method creates a Gravity object.

Path

```
mdb.models[name].Gravity
```

Required arguments

name
A String specifying the load repository key.

createStepName
A String specifying the name of the step in which the load is created.

Optional arguments

distributionType
A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.

field
A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

region
A *Region* object specifying the region to which the load is applied.

comp1
A Float or a Complex specifying the component of the load in the 1-direction.

Note:

Although *comp1*, *comp2*, and *comp3* are optional arguments, at least one of them must be nonzero.

comp2
A Float or a Complex specifying the component of the load in the 2-direction.

comp3
A Float or a Complex specifying the component of the load in the 3-direction.

amplitude
A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

A Gravity object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing Gravity object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Gravity* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing Gravity object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

comp1 A Float, a Complex, or a SymbolicConstant specifying the load component in the 1-direction. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the load component is propagated from the previous static analysis step. Use FREED to remove a previously defined load component.

comp2 A Float, a Complex, or a SymbolicConstant specifying the load component in the 2-direction. For details see *comp1*.

comp3 A Float, a Complex, or a SymbolicConstant specifying the load component in the 3-direction. For details see *comp1*.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous static analysis step. FREED should be used if the load

is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The Gravity object can have the following members:

name
A String specifying the load repository key.

distributionType
A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.

field
A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

region
A *Region* object specifying the region to which the load is applied.

GravityState object

The GravityState object stores the propagating data for a gravity load in a step. One instance of this object is created internally by the *Gravity* object for each step. The instance is also deleted internally by the *Gravity* object.

The GravityState object has no constructor or methods.

The GravityState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The GravityState object has the following members:

comp1

A Float or a Complex specifying the load component in the 1-direction.

comp2

A Float or a Complex specifying the load component in the 2-direction.

comp3

A Float or a Complex specifying the load component in the 3-direction.

comp1State

A SymbolicConstant specifying the propagation state of the load component in the 1-direction. Possible values are UNSET, SET, UNCHANGED, and FREED.

comp2State

A SymbolicConstant specifying the propagation state of the load component in the 2-direction. Possible values are UNSET, SET, UNCHANGED, and FREED.

comp3State

A SymbolicConstant specifying the propagation state of the load component in the 3-direction. Possible values are UNSET, SET, UNCHANGED, and FREED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **DLOAD* (load type label:GRAV)

HydrostaticFluidFlowState object

The HydrostaticFluidFlowState object stores the propagating data for a concentrated HydrostaticFluidFlow object in a step. One instance of this object is created internally by the HydrostaticFluidFlow object for each step. The instance is also deleted internally by the HydrostaticFluidFlow object.

The HydrostaticFluidFlowState object has no constructor or methods.

The HydrostaticFluidFlowState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The HydrostaticFluidFlowState object has the following members:

magnitude

A Float specifying the load magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the load magnitude. Possible values are UNSET, SET, UNCHANGED, and FREED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **FLUID FLUX*

InertiaRelief object

The InertiaRelief object defines an inertia relief load.

The InertiaRelief object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

InertiaRelief(...)

This method creates an InertiaRelief object.

Path

```
mdb.models[name].InertiaRelief
```

Required arguments

name A String specifying the load repository key.

createStepName A String specifying the name of the step in which the load is created.

Optional arguments

u1 A Boolean specifying the 1-direction as a free direction.

Note:

Although *u1*, *u2*, *u3*, *ur1*, *ur2*, and *ur3* are optional arguments, at least one of them must be specified. Further, any specified set of free directions cannot include only two rotational degrees of freedom.

u2 A Boolean specifying the 2-direction as a free direction.

u3 A Boolean specifying the 3-direction as a free direction.

ur1 A Boolean specifying the rotation about the 1–direction as a free direction.

ur2 A Boolean specifying the rotation about the 2–direction as a free direction.

ur3 A Boolean specifying the rotation about the 3–direction as a free direction.

referencePoint A sequence of Floats specifying the *X*, *Y* and *Z*-coordinates of a fixed rotation point or a point on the rotation axis or a point on the symmetry line, about which rotations are defined. Such a point must be specified only for certain combinations of free directions.

localCoordinates `None` or a *DatumCsys* object specifying the local coordinate system of the rigid body degrees of freedom for the inertia relief load. If *localCoordinates*=`None`, the free directions are defined in the global coordinate system. When this member is queried, it returns an Int. The default value is `None`.

Return value

An InertiaRelief object.

Exceptions

None.

`setValues(...)`

This method modifies the data for an existing InertiaRelief object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *InertiaRelief* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing InertiaRelief object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

u1 A Boolean specifying the 1-direction as a free direction.

u2 A Boolean specifying the 2-direction as a free direction.

u3 A Boolean specifying the 3-direction as a free direction.

ur1 A Boolean specifying the rotation about the 1–direction as a free direction.

ur2
A Boolean specifying the rotation about the 2–direction as a free direction.

ur3
A Boolean specifying the rotation about the 3–direction as a free direction.

referencePoint
A sequence of Floats specifying the point about which rotations are defined. The point can be specified only for certain combinations of free directions. The *referencePoint* argument can be one of the following:

- The *X*, *Y* and *Z*-coordinates of a fixed rotation point.
- A point on the rotation axis.
- A point on the symmetry line.

fixed
A Boolean specifying whether the inertia relief loading should remain fixed at the current loading at the start of the step. The default value is OFF.

Return value
`None`.

Exceptions
None.

Members
The InertiaRelief object can have the following members:

name
A String specifying the load repository key.

localCoordinates
`None` or a *DatumCsys* object specifying the local coordinate system of the rigid body degrees of freedom for the inertia relief load. If *localCoordinates*=`None`, the free directions are defined in the global coordinate system. When this member is queried, it returns an Int. The default value is `None`.

region
A *Region* object specifying the region to which the load is applied.

InertiaReliefState object

The InertiaReliefState object stores the propagating data for an inertia relief load in a step. One instance of this object is created internally by the *InertiaRelief* object for each step. The instance is also deleted internally by the *InertiaRelief* object.

The InertiaReliefState object has no constructor or methods.

The InertiaReliefState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The InertiaReliefState object has the following members:

u1

A Boolean specifying the 1-direction as a free direction.

u2

A Boolean specifying the 2-direction as a free direction.

u3

A Boolean specifying the 3-direction as a free direction.

ur1

A Boolean specifying the rotation about the 1–direction as a free direction.

ur2

A Boolean specifying the rotation about the 2–direction as a free direction.

ur3

A Boolean specifying the rotation about the 3–direction as a free direction.

u1State

A SymbolicConstant specifying the propagation state of the Boolean that identifies the local 1-direction as a free direction. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

u2State

A SymbolicConstant specifying the propagation state of the Boolean that identifies the local 2-direction as a free direction. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

u3State

A SymbolicConstant specifying the propagation state of the Boolean that identifies the local the 3-direction as a free direction. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

ur1State

A SymbolicConstant specifying the propagation state of the Boolean that identifies rotation about the local 1-direction as a free direction. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

ur2State

A SymbolicConstant specifying the propagation state of the Boolean that identifies the rotation about the local the 2-direction as a free direction. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

ur3State
A SymbolicConstant specifying the propagation state of the Boolean that identifies the rotation about the local the 3-direction as a free direction. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

fixed
A Boolean specifying whether the inertia relief loading should remain fixed at the current loading at the start of the step. The default value is OFF.

fixedState
A SymbolicConstant specifying the propagation state of the Boolean that identifies whether the inertia relief load should remain fixed at current level at the start of the step. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

referencePointState
A SymbolicConstant specifying the propagation state of the reference point of the inertia relief load. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

referencePoint
A tuple of Floats specifying the point about which rotations are defined. The point can be specified only for certain combinations of free directions. The *referencePoint* argument can be one of the following:

- The *X*, *Y* and *Z*-coordinates of a fixed rotation point.
- A point on the rotation axis.
- A point on the symmetry line.

amplitudeState
A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status
A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude
A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **INERTIA RELIEF*

InwardVolAccel object

The InwardVolAccel object stores the data for an inward volume acceleration acoustic load.

The InwardVolAccel object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

InwardVolAccel(...)

This method creates a InwardVolAccel object.

Path

```
mdb.models[name].InwardVolAccel
```

Required arguments

name	A String specifying the load repository key.
createStepName	A String specifying the name of the step in which the load is created. This must be the name of the first analysis step.
region	A *Region* object specifying the region to which the load is applied.
magnitude	A Float specifying the load magnitude.

Optional arguments

distributionType	A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.
field	A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.
amplitude	A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

An InwardVolAccel object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing InwardVolAccel object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *InwardVolAccel* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing InwardVolAccel object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

magnitude A Float specifying the load magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous static analysis step. FREED should be used if the load is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The InwardVolAccel object can have the following members:

name A String specifying the load repository key.

distributionType A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.

field A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

region A *Region* object specifying the region to which the load is applied.

InwardVolAccelState object

The InwardVolAccelState object stores the propagating data of an inward volume acceleration acoustic load in a step. One instance of this object is created internally by the *InwardVolAccel* object for each step. The instance is also deleted internally by the *InwardVolAccel* object.

The InwardVolAccelState object has no constructor or methods.

The InwardVolAccelState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The InwardVolAccelState object has the following members:

magnitude

A Float specifying the load magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the load magnitude. Possible values are UNSET, SET, UNCHANGED, and FREED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **CLOAD* (degree of freedom: 8)

IonConcentrationFlux object

The IonConcentrationFlux object stores the data for an ion concentration flux load.

The IonConcentrationFlux object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

IonConcentrationFlux(...)

This method creates an IonConcentrationFlux object.

Path

```
mdb.models[name].IonConcentrationFlux
```

Required arguments

name	A String specifying the load repository key.
createStepName	A String specifying the name of the step in which the load is created. This must be the first analysis step name.
region	A *Region* object specifying the region to which the load is applied.
magnitude	A Float specifying the load magnitude.

Optional arguments

distributionType	A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.
field	A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType* = FIELD. The default value is an empty string.
amplitude	A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

A IonConcentrationFlux object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing IonConcentrationFlux object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *IonConcentrationFlux* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing IonConcentrationFlux object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

magnitude A Float specifying the load magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous static analysis step. FREED should be used if the load is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The IonConcentrationFlux object can have the following members:

name A String specifying the load repository key.

distributionType

A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.

field

A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType* = FIELD. The default value is an empty string.

region

A *Region* object specifying the region to which the load is applied.

IonConcentrationFluxState object

The IonConcentrationFluxState object stores the propagating data of an ion concentration flux load in a step. One instance of this object is created internally by the *IonConcentrationFlux* object for each step. The instance is also deleted internally by the *IonConcentrationFlux* object.

The IonConcentrationFluxState object has no constructor or methods.

The IonConcentrationFluxState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The IonConcentrationFluxState object has the following members:

magnitude

A Float specifying the load magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the load magnitude. Possible values are UNSET, SET, UNCHANGED, and FREED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **CFLUX* (degree of freedom: integer 33)

LineLoad object

The LineLoad object stores the data of an applied line load.

The LineLoad object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

LineLoad(...)

This method creates a LineLoad object.

Path

```
mdb.models[name].LineLoad
```

Required arguments

name A String specifying the load repository key.

createStepName A String specifying the name of the step in which the load is created.

region A *Region* object specifying the region to which the load is applied.

Optional arguments

distributionType A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

field A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

comp1 A Float or a Complex specifying the component of the load in the global or the beam local 1-direction.

Note:

Although *comp1*, *comp2*, and *comp3* are optional arguments, at least one of them must be nonzero unless *distributionType*=USER_DEFINED.

comp2 A Float or a Complex specifying the component of the load in the global or the beam local 2-direction.

comp3 A Float or a Complex specifying the component of the load in the global 3-direction.

amplitude A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

system A SymbolicConstant specifying whether the load is applied in a global or the beam local frame of reference. Possible values are GLOBAL and LOCAL. The default value is GLOBAL.

Return value

A LineLoad object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing LineLoad object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *LineLoad* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing LineLoad object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

comp1 A Float, a Complex, or a SymbolicConstant specifying the load component in the global or the beam local 1-direction. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the load component is propagated from the previous static analysis step. Use FREED to remove a previously defined load component.

comp2
A Float, a Complex, or a SymbolicConstant specifying the load component in the global or the beam local 2-direction. For details see *comp1*.

comp3
A Float, a Complex, or a SymbolicConstant specifying the load component in the global 3-direction. For details see *comp1*.

amplitude
A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous static analysis step. FREED should be used if the load is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value
`None.`

Exceptions
None.

Members
The LineLoad object can have the following members:

name
A String specifying the load repository key.

distributionType
A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

system
A SymbolicConstant specifying whether the load is applied in a global or the beam local frame of reference. Possible values are GLOBAL and LOCAL. The default value is GLOBAL.

field
A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

region
A *Region* object specifying the region to which the load is applied.

LineLoadState object

The LineLoadState object stores the propagating data of a line load in a step. One instance of this object is created internally by the *LineLoad* object for each step. The instance is also deleted internally by the *LineLoad* object.

The LineLoadState object has no constructor or methods.

The LineLoadState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The LineLoadState object has the following members:

comp1

A Float or a Complex specifying the load component in the global or the beam local 1-direction.

comp2

A Float or a Complex specifying the load component in the global or the beam local 2-direction.

comp3

A Float or a Complex specifying the load component in the global 3-direction.

comp1State

A SymbolicConstant specifying the propagation state of the load component in the global or the beam local 1-direction. Possible values are UNSET, SET, UNCHANGED, and FREED.

comp2State

A SymbolicConstant specifying the propagation state of the load component in the global or the beam local 2-direction. Possible values are UNSET, SET, UNCHANGED, and FREED.

comp3State

A SymbolicConstant specifying the propagation state of the load component in the global 3-direction. Possible values are UNSET, SET, UNCHANGED, and FREED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **DLOAD* (load type label: PX, PY, PZ for a global reference frame, and P1, P2 for a local reference frame)

Moment object

The Moment object stores the data for a moment.

The Moment object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

Moment(...)

This method creates a Moment object.

Path

```
mdb.models[name].Moment
```

Required arguments

name A String specifying the load repository key.

createStepName A String specifying the name of the step in which the load is created.

region A *Region* object specifying the region to which the load is applied.

Optional arguments

cm1 A Float or a Complex specifying the load component in the 4-direction.

Note:

Although *comp1*, *comp2*, and *comp3* are optional arguments, at least one of them must be nonzero.

cm2 A Float or a Complex specifying the load component in the 5- direction.

cm3 A Float or a Complex specifying the load component in the 6-direction.

amplitude A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

follower A Boolean specifying whether the direction of the force rotates with the rotation of the node. You should provide the *follower* argument only if it is valid for the specified step. The default value is OFF.

localCsys `None` or a *DatumCsys* object specifying the ID of the Datum coordinate system used as the local coordinate system of the load. If *localCsys*=`None`, the load is defined in the global coordinate system. When this member is queried, it returns an Int. The default value is `None`.

distributionType A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.

field A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

Return value

A Moment object.

Exceptions

None.

`setValues(...)`

This method modifies the data for an existing Moment object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Moment* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing Moment object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

comp1 A Float, a Complex, or a SymbolicConstant specifying the load component in the 4-direction. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should

be used if the load component is propagated from the previous static analysis step. Use FREED to remove a previously defined load component.

comp2
A Float, a Complex, or a SymbolicConstant specifying the load component in the 5-direction. For details see *comp1*.

comp3
A Float, a Complex, or a SymbolicConstant specifying the load component in the 6-direction. For details see *comp1*.

amplitude
A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous static analysis step. FREED should be used if the load is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value
`None`.

Exceptions
None.

Members
The Moment object can have the following members:

name
A String specifying the load repository key.

distributionType
A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.

follower
A Boolean specifying whether the direction of the force rotates with the rotation of the node. You should provide the *follower* argument only if it is valid for the specified step. The default value is OFF.

localCsys
`None` or a *DatumCsys* object specifying the ID of the Datum coordinate system used as the local coordinate system of the load. If *localCsys*=`None`, the load is defined in the global coordinate system. When this member is queried, it returns an Int. The default value is `None`.

field
A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

region
A *Region* object specifying the region to which the load is applied.

MomentState object

The MomentState object stores the propagating data for a moment in a step. One instance of this object is created internally by the *Moment* object for each step. The instance is also deleted internally by the *Moment* object.

The MomentState object has no constructor or methods.

The MomentState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The MomentState object has the following members:

cm1

A Float or a Complex specifying the load component in the 4-direction.

cm2

A Float or a Complex specifying the load component in the 5-direction.

cm3

A Float or a Complex specifying the load component in the 6-direction.

cm1State

A SymbolicConstant specifying the propagation state of the load component in the 4-direction. Possible values are UNSET, SET, UNCHANGED, and FREED.

cm2State

A SymbolicConstant specifying the propagation state of the load component in the 5-direction. Possible values are UNSET, SET, UNCHANGED, and FREED.

cm3State

A SymbolicConstant specifying the propagation state of the load component in the 6-direction. Possible values are UNSET, SET, UNCHANGED, and FREED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **CLOAD* (degree of freedom: 4, 5, or 6)

PEGLoad object

The PEGLoad object stores the data for a PEG load.

The PEGLoad object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

PEGLoad(...)

This method creates a PEGLoad object.

Path

```
mdb.models[name].PEGLoad
```

Required arguments

name
A String specifying the load repository key.

createStepName
A String specifying the name of the step in which the load is created.

region
A *Region* object specifying the region to which the load is applied.

Optional arguments

distributionType
A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.

field
A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

comp1
A Float or a Complex specifying the load component at dof 1 of reference node 1.

Note:

Although *comp1*, *comp2*, and *comp3* are optional arguments, at least one of them must be nonzero.

comp2
A Float or a Complex specifying the load component at dof 1 of reference node 2.

comp3
A Float or a Complex specifying the load component at dof 2 of reference node 2.

amplitude
A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

A PEGLoad object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing PEGLoad object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *PEGLoad* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing PEGLoad object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

comp1 A Float, a Complex, or a SymbolicConstant specifying the load component at dof 1 of reference node 1. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the load component is propagated from the previous static analysis step. Use FREED to remove a previously defined load component.

comp2 A Float, a Complex, or a SymbolicConstant specifying the load component at dof 1 of reference node 2. For details see *comp1*.

comp3 A Float, a Complex, or a SymbolicConstant specifying the load component at dof 2 of reference node 2. For details see *comp1*.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous static analysis step. FREED should be used if the load

is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The PEGLoad object can have the following members:

name
A String specifying the load repository key.

distributionType
A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.

field
A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

region
A *Region* object specifying the region to which the load is applied.

PEGLoadState object

The PEGLoadState object stores the propagating data for a concentrated force in a step. One instance of this object is created internally by the *PEGLoad* object for each step. The instance is also deleted internally by the *PEGLoad* object.

The PEGLoadState object has no constructor or methods.

The PEGLoadState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The PEGLoadState object has the following members:

comp1

A Float or a Complex specifying the load component at dof 1 of reference node 1.

comp2

A Float or a Complex specifying the load component at dof 1 of reference node 2.

comp3

A Float or a Complex specifying the load component at dof 2 of reference node 2.

comp1State

A SymbolicConstant specifying the propagation state of the load component at dof 1 of reference node 1. Possible values are UNSET, SET, UNCHANGED, and FREED.

comp2State

A SymbolicConstant specifying the propagation state of the load component at dof 1 of reference node 2. Possible values are UNSET, SET, UNCHANGED, and FREED.

comp3State

A SymbolicConstant specifying the propagation state of the load component at dof 2 of reference node 2. Possible values are UNSET, SET, UNCHANGED, and FREED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **CLOAD* (degree of freedom: 1 or 2)

PipePressure object

The PipePressure object stores the data for a pressure applied to pipe or elbow elements.

The PipePressure object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

PipePressure(...)

This method creates a *Pressure* object.

Path

```
mdb.models[name].PipePressure
```

Required arguments

name
A String specifying the load repository key.

createStepName
A String specifying the name of the step in which the pressure is created.

region
A *Region* object specifying the region to which the load is applied.

magnitude
A Float specifying the pressure magnitude.

Note:

magnitude is optional if *distributionType*=USER_DEFINED.

diameter
A Float specifying the effective inner or outer diameter.

hZero
A Float specifying the height of the zero pressure level when *distributionType*=HYDROSTATIC.

hReference
A Float specifying the height of the reference pressure level when *distributionType*=HYDROSTATIC.

Optional arguments

field
A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

amplitude
A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

distributionType A SymbolicConstant specifying whether the load is uniform. Possible values are UNIFORM, HYDROSTATIC, USER_DEFINED, and FIELD. The default value is UNIFORM.

side A SymbolicConstant specifying whether the pressure is applied internally or externally. Possible values are INTERNAL and EXTERNAL. The default value is INTERNAL.

Return value

A PipePressure object.

Exceptions

None.

`setValues(...)`

This method modifies the data for an existing PipePressure object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *PipePressure* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing PipePressure object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

magnitude A Float specifying the pressure magnitude.

hZero A Float specifying the height of the zero pressure level when *distributionType*=HYDROSTATIC.

hReference A Float specifying the height of the reference pressure level when *distributionType*=HYDROSTATIC.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous static analysis step. FREED should be used if the load has no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The PipePressure object can have the following members:

name A String specifying the load repository key.

distributionType A SymbolicConstant specifying whether the load is uniform. Possible values are UNIFORM, HYDROSTATIC, USER_DEFINED, and FIELD. The default value is UNIFORM.

side A SymbolicConstant specifying whether the pressure is applied internally or externally. Possible values are INTERNAL and EXTERNAL. The default value is INTERNAL.

diameter A Float specifying the effective inner or outer diameter.

field A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

region A *Region* object specifying the region to which the load is applied.

PipePressureState object

The PipePressureState object stores the propagating data for a pipe pressure in a step. One instance of this object is created internally by the *PipePressure* object for each step. The instance is also deleted internally by the *PipePressure* object.

The PipePressureState object has no constructor or methods.

The PipePressureState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The PipePressureState object has the following members:

magnitude

A Float or a Complex specifying the load magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the load magnitude. Possible values are UNSET, SET, UNCHANGED, and FREED.

hZero

A Float specifying the height of the zero pressure level when the pipe pressure *distributionType*=HYDROSTATIC.

hZeroState

A SymbolicConstant specifying the propagation state of *hZero*. Possible values are UNSET, SET, UNCHANGED, and FREED.

hReference

A Float specifying the height of the reference pressure level when the pipe pressure *distributionType*=HYDROSTATIC.

hReferenceState

A SymbolicConstant specifying the propagation state of *hReference*. Possible values are UNSET, SET, UNCHANGED, and FREED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE

- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **DSLOAD*
- **DLOAD*

Pressure object

The Pressure object defines a pressure load.

The Pressure object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

Pressure(...)

This method creates a Pressure object.

Path

```
mdb.models[name].Pressure
```

Required arguments

name
A String specifying the load repository key.

createStepName
A String specifying the name of the step in which the pressure is created.

region
A *Region* object specifying the region to which the load is applied.

magnitude
A Float or a Complex specifying the pressure magnitude.

Note:

magnitude is optional if *distributionType*=USER_DEFINED.

hZero
A Float specifying the height of the zero pressure level when *distributionType*=HYDROSTATIC.

hReference
A Float specifying the height of the reference pressure level when *distributionType*=HYDROSTATIC.

Optional arguments

field
A String specifying the name of the *AnalyticalField* or *DiscreteField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD or *distributionType*=DISCRETE_FIELD. The default value is an empty string.

refPoint
A Region specifying the reference point from which the relative velocity is determined when *distributionType*=STAGNATION or VISCOUS.

distributionType A SymbolicConstant specifying how the pressure is distributed spatially. Possible values are UNIFORM, USER_DEFINED, FIELD, HYDROSTATIC, STAGNATION, VISCOUS, TOTAL_FORCE, and DISCRETE_FIELD. The default value is UNIFORM.

amplitude A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

A Pressure object.

Exceptions

None.

`setValues(...)`

This method modifies the data for an existing Pressure object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Pressure* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing Pressure object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

magnitude A Float or a Complex specifying the pressure magnitude.

hZero A Float specifying the height of the zero pressure level when *distributionType*=HYDROSTATIC.

hReference A Float specifying the height of the reference pressure level when *distributionType*=HYDROSTATIC.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the load has no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The Pressure object can have the following members:

name A String specifying the load repository key.

distributionType A SymbolicConstant specifying how the pressure is distributed spatially. Possible values are UNIFORM, USER_DEFINED, FIELD, HYDROSTATIC, STAGNATION, VISCOUS, TOTAL_FORCE, and DISCRETE_FIELD. The default value is UNIFORM.

field A String specifying the name of the *AnalyticalField* or *DiscreteField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD or *distributionType*=DISCRETE_FIELD. The default value is an empty string.

region A *Region* object specifying the region to which the load is applied.

PressureState object

The PressureState object stores the propagating data for a pressure in a step. One instance of this object is created internally by the *Pressure* object for each step. The instance is also deleted internally by the *Pressure* object.

The PressureState object has no constructor or methods.

The PressureState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The PressureState object has the following members:

magnitude

A Float or a Complex specifying the pressure magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the pressure magnitude. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

hZero

A Float specifying the height of the zero pressure level when the pressure *distributionType*=HYDROSTATIC.

hZeroState

A SymbolicConstant specifying the propagation state of *hZero*. Possible values are UNSET, SET, UNCHANGED, and FREED.

hReference

A Float specifying the height of the reference pressure level when the pressure *distributionType*=HYDROSTATIC.

hReferenceState

A SymbolicConstant specifying the propagation state of *hReference*. Possible values are UNSET, SET, UNCHANGED, and FREED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE

- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **DSLOAD*
- **DLOAD*

RotationalBodyForce object

The RotationalBodyForce object stores the data for a rotational body force.

The RotationalBodyForce object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

RotationalBodyForce(...)

This method creates a RotationalBodyForce object.

Path

```
mdb.models[name].RotationalBodyForce
```

Required arguments

name A String specifying the load repository key.

createStepName A String specifying the name of the step in which the load is created. This must be the first analysis step name.

region A *Region* object specifying the region to which the load is applied.

magnitude A Float specifying the load magnitude.

point1 A sequence of Floats specifying the first point on the axis of rotation for the load.

point2 A sequence of Floats specifying the second point on the axis of rotation for the load.

Optional arguments

distributionType A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.

field A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

centrifugal A Boolean specifying whether or not the effect of the load is centrifugal. The default value is OFF.

Note: At least one of *centrifugal* or *rotaryAcceleration* or *rotorDynamicloads*must be specified and only one must have the value ON.

rotaryAcceleration A Boolean specifying whether or not the effect of the load is rotary acceleration. The default value is OFF.

Note: At least one of *centrifugal* or *rotaryAcceleration* or *rotorDynamicloads* must be specified and only one must have the value ON.

rotorDynamicloads A Boolean specifying whether or not the effect of the load is rotordynamic. The default value is OFF.

Note: At least one of *centrifugal* or *rotaryAcceleration* or *rotorDynamicloads* must be specified and only one must have the value ON.

amplitude A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

A RotationalBodyForce object.

Exceptions

None.

`setValues(...)`

This method modifies the data for an existing RotationalBodyForce object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *RotationalBodyForce* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing RotationalBodyForce object in the specified step.

Required arguments

stepName
A String specifying the name of the step in which the load is modified.

Optional arguments

magnitude
A Float specifying the load magnitude.

amplitude
A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous static analysis step. FREED should be used if the load is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The RotationalBodyForce object can have the following members:

name
A String specifying the load repository key.

distributionType
A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.

centrifugal
A Boolean specifying whether or not the effect of the load is centrifugal. The default value is OFF.

Note:

At least one of *centrifugal* or *rotaryAcceleration* or *rotorDynamicloads* must be specified and only one must have the value ON.

rotaryAcceleration
A Boolean specifying whether or not the effect of the load is rotary acceleration. The default value is OFF.

Note:

At least one of *centrifugal* or *rotaryAcceleration* or *rotarDynamicloads* must be specified and only one must have the value ON.

rotorDynamicloads
A Boolean specifying whether or not the effect of the load is rotordynamic. The default value is OFF.

Note:

At least one of *centrifugal* or *rotaryAcceleration* or *rotorDynamicloads* must be specified and only one must have the value ON.

point1

A tuple of Floats specifying the first point on the axis of rotation for the load.

point2

A tuple of Floats specifying the second point on the axis of rotation for the load.

field

A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

region

A *Region* object specifying the region to which the load is applied.

RotationalBodyForceState object

The RotationalBodyForceState object stores the propagating data of a rotational body force in a step. One instance of this object is created internally by the *RotationalBodyForce* object for each step. The instance is also deleted internally by the *RotationalBodyForce* object.

The RotationalBodyForceState object has no constructor or methods.

The RotationalBodyForceState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The RotationalBodyForceState object has the following members:

magnitude

A Float specifying the load magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the load magnitude. Possible values are UNSET, SET, UNCHANGED, and FREED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **DLOAD* (load type labels: CENTRIF, ROTA)

ShellEdgeLoad object

The ShellEdgeLoad object defines shell edge loads on a region.

The ShellEdgeLoad object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

ShellEdgeLoad(...)

This method creates a ShellEdgeLoad object.

Path

```
mdb.models[name].ShellEdgeLoad
```

Required arguments

name A String specifying the load repository key.

createStepName A String specifying the name of the step in which the load is created.

region A *Region* object specifying the region to which the load is applied.

magnitude A Float or Complex specifying the load magnitude. *magnitude* is optional if *distributionType*=USER_DEFINED

Optional arguments

distributionType A SymbolicConstant specifying how the shell edge load is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

field A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

amplitude A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

angle A Float specifying an additional rotation of *directionVector* about an axis. The default value is 0.This parameter is available only if *traction* is GENERAL.

axis A SymbolicConstant specifying the axis about which to apply an additional rotation of *directionVector*. Possible values are AXIS_1, AXIS_2, AXIS_3. The default value is AXIS_1.

This parameter is available only if *traction* is GENERAL.

localCsys A *DatumCsys* object specifying the local coordinate system of the load's degrees of freedom. The default value is `None`, indicating that the degrees of freedom are defined in the global coordinate system or by the *userCsys* parameter if defined. This parameter is available only if *traction* is GENERAL. When this member is queried, it returns an Int.

userCsys A String specifying a CSYS defined by a user-subroutine. The default value is `None`, indicating that the degrees of freedom are defined in the global coordinate system or by the *localCsys* parameter if defined. This parameter is available only if *traction* is GENERAL.

directionVector A tuple of two points specifying the direction of the load. Each point is specified as a point region or a tuple of coordinates. If *traction* is SHEAR, then *directionVector* will be projected onto the region surface. This parameter is available only if *traction* is GENERAL.

follower A Boolean specifying whether the direction of the force changes with rotation. The default value is ON. This parameter may be modified only if *traction* is GENERAL. You should provide the *follower* argument only if it is valid for the specified step.

resultant A Boolean specifying whether to maintain a constant resultant force by defining traction per unit undeformed area. If *resultant* is OFF, traction is defined per unit deformed area. The default value is OFF. You should provide the *resultant* argument only if it is valid for the specified step.

traction A SymbolicConstant specifying how to apply surface traction. Possible values are NORMAL, TRANSVERSE, SHEAR, MOMENT and GENERAL. The default value is NORMAL.

Return value

A ShellEdgeLoad object.

Exceptions

None.

`setValues(...)`

This method modifies the data for an existing ShellEdgeLoad object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ShellEdgeLoad* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing ShellEdgeLoad object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the surface pore fluid flow is modified.

Optional arguments

magnitude A Float, a Complex, or the SymbolicConstant UNCHANGED specifying the load magnitude. UNCHANGED should be used if the magnitude is propagated from the previous analysis step.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the load has no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The ShellEdgeLoad object can have the following members:

name A String specifying the load repository key.

distributionType A SymbolicConstant specifying how the shell edge load is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

field A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

region A *Region* object specifying the region to which the load is applied.

ShellEdgeLoadState object

The ShellEdgeLoadState object stores the propagating data for a *ShellEdgeLoad* object in a step. One instance of this object is created internally by the *ShellEdgeLoad* object for each step. The instance is also deleted internally by the *ShellEdgeLoad* object.

The ShellEdgeLoadState object has no constructor or methods.

The ShellEdgeLoadState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The ShellEdgeLoadState object has the following members:

magnitude

A Float or a Complex specifying the load magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the load magnitude. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **DSLOAD*
- **DLOAD*

SubmodelSB object

The SubmodelSB object stores the data for a submodel surface based load.

The SubmodelSB object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

SubmodelSB(...)

This method creates a SubmodelSB object.

Path

```
mdb.models[name].SubmodelSB
```

Required arguments

name
A String specifying the load repository key.

createStepName
A String specifying the name of the step in which the load is created.

region
A *Region* object specifying the region to which the load is applied.

globalStep
A String specifying the step in the global model from which Abaqus reads the values of the variables that will drive the submodel analysis. The String indicates the position of the step in the sequence of analysis steps. For example, *globalStep*='1' indicates the first step.

Optional arguments

globalDrivingRegion
A String specifying the element set in the global model that will be searched for elements whose responses will be used to drive the submodel. An empty string indicates that the entire global model will be searched. The default value is an empty string.

absoluteExteriorTolerance
`None` or a Float specifying the absolute value by which a driven node of the submodel can lie outside the region of the elements of the global model. The default value is `None`.

exteriorTolerance
`None` or a Float specifying the fraction of the average element size in the global model by which a driven node of the submodel can lie outside the region of the elements of the global model. The default value is 0.05.

globalIncrement
An Int specifying the increment number in the global model step from which the solution will be used to specify the values of the driven variables. If *globalIncrement*=0, the solution from the last increment will be used. The *globalIncrement* argument is applicable only for linear perturbation steps. The default value is 0.

Return value

A SubmodelSB object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing SubmodelSB object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *SubmodelSB* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing SubmodelSB object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

fixed A Boolean specifying whether the load should remain fixed at the current values at the start of the step. The default value is ON.

globalStep A String specifying the step in the global model from which Abaqus reads the values of the variables that will drive the submodel analysis. The String indicates the position of the step in the sequence of analysis steps. For example, *globalStep*='1' indicates the first step. The *globalStep* argument is applicable only if *fixed*=OFF.

globalIncrement An Int specifying the increment number in the global model step at which the solution will be used to specify the values of the driven variables. If *globalIncrement*=0, the solution from the last increment will be used. The *globalIncrement* argument is applicable only for linear perturbation steps and if *fixed*=OFF. The default value is 0.

Return value
`None`.

Exceptions
None.

Members
The SubmodelSB object can have the following members:

name
A String specifying the load repository key.

absoluteExteriorTolerance
`None` or a Float specifying the absolute value by which a driven node of the submodel can lie outside the region of the elements of the global model. The default value is `None`.

exteriorTolerance
`None` or a Float specifying the fraction of the average element size in the global model by which a driven node of the submodel can lie outside the region of the elements of the global model. The default value is 0.05.

globalDrivingRegion
A String specifying the element set in the global model that will be searched for elements whose responses will be used to drive the submodel. An empty string indicates that the entire global model will be searched. The default value is an empty string.

region
A *Region* object specifying the region to which the load is applied.

SubmodelSBState object

The SubmodelSBState object stores the propagating data for a Submodel load in a step. One instance of this object is created internally by the *SubmodelSB* object for each step. The instance is also deleted internally by the *SubmodelSB* object.

The SubmodelSBState object has no constructor or methods.

The SubmodelSBState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The SubmodelSBState object has the following members:

globalStepState

A SymbolicConstant specifying the propagation state of the *globalStep* member. Possible values are SET and UNCHANGED.

globalIncrement

An Int specifying the increment number in the global model step at which the solution will be used to specify the values of the driven variables. This argument is applicable only for linear perturbation steps.

globalIncrementState

A SymbolicConstant specifying the propagation state of the *globalIncrement* member. Possible values are SET and UNCHANGED.

globalStep

A String specifying the step in the global model from which Abaqus reads the values of the variables that will drive the submodel analysis. The String indicates the position of the step in the sequence of analysis steps. For example, *globalStep*='1' indicates the first step.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **SUBMODEL*
- **DSLOAD*, SUBMODEL

SubstructureLoad object

The SubstructureLoad object defines a substructure load.

The SubstructureLoad object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

SubstructureLoad(...)

This method creates a SubstructureLoad object.

Path

```
mdb.models[name].SubstructureLoad
```

Required arguments

name A String specifying the load repository key.

createStepName A String specifying the name of the step in which the substructure load is created.

region A *Region* object specifying the region to which the load is applied.

loadCaseNames A list of names of the load cases that should be activated by this substructure load.

magnitude A Float specifying the multiplier for the load case magnitude.

Optional arguments

amplitude A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

A SubstructureLoad object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing SubstructureLoad object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *SubstructureLoad* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

`setValuesInStep(...)`

This method modifies the propagating data for an existing SubstructureLoad object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

loadCaseNames A list of names of the load cases that should be activated by this substructure load.

magnitude A Float specifying the multiplier for the load case magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the load has no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The SubstructureLoad object can have the following members:

name A String specifying the load repository key.

region A *Region* object specifying the region to which the load is applied.

SubstructureLoadState object

The SubstructureLoadState object stores the propagating data for a substructure load in a step. One instance of this object is created internally by the *SubstructureLoad* object for each step. The instance is also deleted internally by the *SubstructureLoad* object.

The SubstructureLoadState object has no constructor or methods.

The SubstructureLoadState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The SubstructureLoadState object has the following members:

loadCaseNames

A tuple of strings specifying the names of the load cases to be activated.

magnitude

A Float or a Complex specifying the load magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the load magnitude. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **SLOAD*

SurfaceCharge object

The SurfaceCharge object stores the data for a surface charge.

The SurfaceCharge object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

SurfaceCharge(...)

This method creates a SurfaceCharge object.

Path

```
mdb.models[name].SurfaceCharge
```

Required arguments

name	A String specifying the load repository key.
createStepName	A String specifying the name of the step in which the load is created. This must be the first analysis step name.
region	A *Region* object specifying the region to which the load is applied.
magnitude	A Float specifying the load magnitude.

Optional arguments

distributionType	A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.
field	A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.
amplitude	A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

A SurfaceCharge object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing SurfaceCharge object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *SurfaceCharge* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing SurfaceCharge object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

magnitude A Float specifying the load magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous static analysis step. FREED should be used if the load is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The SurfaceCharge object can have the following members:

name A String specifying the load repository key.

distributionType

A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.

field

A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

region

A *Region* object specifying the region to which the load is applied.

SurfaceChargeState object

The SurfaceChargeState object stores the propagating data of a surface charge in a step. One instance of this object is created internally by the *SurfaceCharge* object for each step. The instance is also deleted internally by the *SurfaceCharge* object.

The SurfaceChargeState object has no constructor or methods.

The SurfaceChargeState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The SurfaceChargeState object has the following members:

magnitude

A Float specifying the load magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the load magnitude. Possible values are UNSET, SET, UNCHANGED, and FREED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **DSECHARGE* (load type label: ES)

SurfaceConcentrationFlux object

The SurfaceConcentrationFlux object defines surface concentration flux from a region or into a region.

The SurfaceConcentrationFlux object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

SurfaceConcentrationFlux(...)

This method creates a SurfaceConcentrationFlux object.

Path

```
mdb.models[name].SurfaceConcentrationFlux
```

Required arguments

name	A String specifying the load repository key.
createStepName	A String specifying the name of the step in which the load is created.
region	A *Region* object specifying the region to which the load is applied.
magnitude	A Float specifying the surface concentration flux magnitude. *magnitude* is optional if *distributionType*=USER_DEFINED.

Optional arguments

field	A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.
distributionType	A SymbolicConstant specifying how the surface concentration flux is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.
amplitude	A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

A SurfaceConcentrationFlux object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing SurfaceConcentrationFlux object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *SurfaceConcentrationFlux* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing SurfaceConcentrationFlux object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the surface concentration flux is modified.

Optional arguments

magnitude A Float specifying the surface concentration flux magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the load has no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The SurfaceConcentrationFlux object can have the following members:

name

A String specifying the load repository key.

distributionType

A SymbolicConstant specifying how the surface concentration flux is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

field

A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

region

A *Region* object specifying the region to which the load is applied.

SurfaceConcentrationFluxState object

The SurfaceConcentrationFluxState object stores the propagating data for a *SurfaceConcentrationFlux* object in a step. One instance of this object is created internally by the *SurfaceConcentrationFlux* object for each step. The instance is also deleted internally by the *SurfaceConcentrationFlux* object.

The SurfaceConcentrationFluxState object has no constructor or methods.

The SurfaceConcentrationFluxState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The SurfaceConcentrationFluxState object has the following members:

magnitude

A Float specifying the surface concentration flux magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the surface concentration flux magnitude. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **DSFLUX*

SurfaceCurrent object

The SurfaceCurrent object stores the data for a surface current.

The SurfaceCurrent object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

SurfaceCurrent(...)

This method creates a SurfaceCurrent object.

Path

```
mdb.models[name].SurfaceCurrent
```

Required arguments

name	A String specifying the load repository key.
createStepName	A String specifying the name of the step in which the load is created. This must be the first analysis step name.
region	A *Region* object specifying the region to which the load is applied.
magnitude	A Float specifying the load magnitude.

Optional arguments

distributionType	A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.
field	A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.
amplitude	A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

A SurfaceCurrent object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing SurfaceCurrent object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *SurfaceCurrent* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing SurfaceCurrent object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

magnitude A Float specifying the load magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous static analysis step. FREED should be used if the load is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The SurfaceCurrent object can have the following members:

name A String specifying the load repository key.

distributionType A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and FIELD. The default value is UNIFORM.

field A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

region A *Region* object specifying the region to which the load is applied.

SurfaceCurrentDensity object

The SurfaceCurrentDensity object stores the data for a surface current.

The SurfaceCurrentDensity object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

SurfaceCurrentDensity(...)

This method creates a SurfaceCurrentDensity object.

Path

```
mdb.models[name].SurfaceCurrentDensity
```

Required arguments

name	A String specifying the load repository key.
createStepName	A String specifying the name of the step in which the load is created. This must be the first analysis step name.
region	A *Region* object specifying the region to which the load is applied.
comp1	A Complex specifying the first component of the load.
comp2	A Complex specifying the second component of the load.
comp3	A Complex specifying the third component of the load.

Optional arguments

distributionType	A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and USER_DEFINED. The default value is UNIFORM.
amplitude	A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

A SurfaceCurrentDensity object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing SurfaceCurrentDensity object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *SurfaceCurrentDensity* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing SurfaceCurrentDensity object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

comp1 A Complex specifying the first component of the load.

comp2 A Complex specifying the second component of the load.

comp3 A Complex specifying the third component of the load.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous static analysis step. FREED should be used if the load is changed to have no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The SurfaceCurrentDensity object can have the following members:

name

A String specifying the load repository key.

distributionType

A SymbolicConstant specifying how the load is distributed spatially. Possible values are UNIFORM and USER_DEFINED. The default value is UNIFORM.

region

A *Region* object specifying the region to which the load is applied.

SurfaceCurrentState object

The SurfaceCurrentState object stores the propagating data of a surface current in a step. One instance of this object is created internally by the *SurfaceCurrent* object for each step. The instance is also deleted internally by the *SurfaceCurrent* object.

The SurfaceCurrentState object has no constructor or methods.

The SurfaceCurrentState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The SurfaceCurrentState object has the following members:

magnitude

A Float specifying the load magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the load magnitude. Possible values are UNSET, SET, UNCHANGED, and FREED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **DSECURRENT* (load type label: CS)

SurfaceHeatFlux object

The SurfaceHeatFlux object defines surface heat flux from a region or into a region.

The SurfaceHeatFlux object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

SurfaceHeatFlux(...)

This method creates a SurfaceHeatFlux object.

Path

```
mdb.models[name].SurfaceHeatFlux
```

Required arguments

name A String specifying the load repository key.

createStepName A String specifying the name of the step in which the load is created.

region A *Region* object specifying the region to which the load is applied.

magnitude A Float specifying the surface heat flux magnitude. *magnitude* is optional if *distributionType*=USER_DEFINED.

Optional arguments

field A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

distributionType A SymbolicConstant specifying how the surface heat flux is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

amplitude A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

A SurfaceHeatFlux object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing SurfaceHeatFlux object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *SurfaceHeatFlux* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing SurfaceHeatFlux object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the surface heat flux is modified.

Optional arguments

magnitude A Float specifying the surface heat flux magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the load has no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The SurfaceHeatFlux object can have the following members:

name A String specifying the load repository key.

distributionType A SymbolicConstant specifying how the surface heat flux is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

field A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

region A *Region* object specifying the region to which the load is applied.

SurfaceHeatFluxState object

The SurfaceHeatFluxState object stores the propagating data for a surface *SurfaceHeatFlux* object in a step. One instance of this object is created internally by the *SurfaceHeatFlux* object for each step. The instance is also deleted internally by the *SurfaceHeatFlux* object.

The SurfaceHeatFluxState object has no constructor or methods.

The SurfaceHeatFluxState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The SurfaceHeatFluxState object has the following members:

magnitude

A Float specifying the surface heat flux magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the surface heat flux magnitude. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **DSFLUX*

SurfacePoreFluid object

The SurfacePoreFluid object defines surface pore fluid flow from a region or into a region.

The SurfacePoreFluid object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

SurfacePoreFluid(...)

This method creates a SurfacePoreFluid object.

Path

```
mdb.models[name].SurfacePoreFluid
```

Required arguments

name A String specifying the load repository key.

createStepName A String specifying the name of the step in which the load is created.

region A *Region* object specifying the region to which the load is applied.

magnitude A Float specifying the surface pore fluid flow magnitude. *magnitude* is optional if *distributionType*=USER_DEFINED.

Optional arguments

field A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

distributionType A SymbolicConstant specifying whether the load is uniform. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

amplitude A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

A SurfacePoreFluid object.

Exceptions

None.

setValues(...)

This method modifies the data for an existing SurfacePoreFluid object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *SurfacePoreFluid* method, except for the *name* and *createStepName* arguments.

Return value

```
None.
```

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing SurfacePoreFluid object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the surface pore fluid flow is modified.

Optional arguments

magnitude A Float specifying the surface pore fluid flow magnitude.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the load has no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

```
None.
```

Exceptions

None.

Members

The SurfacePoreFluid object can have the following members:

name A String specifying the load repository key.

distributionType A SymbolicConstant specifying whether the load is uniform. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

field A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

region A *Region* object specifying the region to which the load is applied.

SurfacePoreFluidState object

The SurfacePoreFluidState object stores the propagating data for a *SurfacePoreFluid* object in a step. One instance of this object is created internally by the *SurfacePoreFluid* object for each step. The instance is also deleted internally by the *SurfacePoreFluid* object.

The SurfacePoreFluidState object has no constructor or methods.

The SurfacePoreFluidState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The SurfacePoreFluidState object has the following members:

magnitude

A Float specifying the surface pore fluid flow magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the surface pore fluid flow magnitude. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Corresponding analysis keywords

- **DSFLOW*

SurfaceTraction object

The SurfaceTraction object defines surface traction on a region.

The SurfaceTraction object is derived from the *Load* object.

Access

```
import load
mdb.models[name].loads[name]
```

SurfaceTraction(...)

This method creates a SurfaceTraction object.

Path

```
mdb.models[name].SurfaceTraction
```

Required arguments

name A String specifying the load repository key.

createStepName A String specifying the name of the step in which the load is created.

region A *Region* object specifying the region to which the load is applied.

magnitude A Float or Complex specifying the load magnitude. *magnitude* is optional if *distributionType*=USER_DEFINED.

Optional arguments

distributionType A SymbolicConstant specifying how the surface traction is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

field A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

amplitude A String or the SymbolicConstant UNSET specifying the name of the amplitude reference. UNSET should be used if the load has no amplitude reference. The default value is UNSET. You should provide the *amplitude* argument only if it is valid for the specified step.

angle A Float specifying an additional rotation of *directionVector* about an axis. The default value is 0.0.

axis A SymbolicConstant specifying the axis about which to apply an additional rotation of *directionVector*. Possible values are AXIS_1, AXIS_2, and AXIS_3. The default value is AXIS_1.

localCsys `None` or a *DatumCsys* object specifying the local coordinate system of the load's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system

or by the *userCsys* parameter if defined. When this member is queried, it returns an Int. The default value is `None`.

userCsys

A String specifying a CSYS defined by a user-subroutine. If *userCsys*=`None`, the degrees of freedom are defined in the global coordinate system or by the *localCsys* parameter if defined. The default value is "None".

directionVector

A *VertexArray* object of length 2 specifying the direction of the load. Instead of through a *Vertex*, each point may be specified through a tuple of coordinates. If *traction* is SHEAR, then *directionVector* will be projected onto the region surface. This parameter is available only if *traction* is GENERAL or SHEAR.

follower

A Boolean specifying whether the direction of the force changes with rotation. The default value is ON.

This parameter may be modified only if *traction* is GENERAL. You should provide the *follower* argument only if it is valid for the specified step.

resultant

A Boolean specifying whether the to maintain a constant resultant force by defining traction per unit undeformed area. If *resultant* is OFF, traction is defined per unit deformed area. The default value is OFF.

You should provide the *resultant* argument only if it is valid for the specified step.

traction

A SymbolicConstant specifying how to apply surface traction. Possible values are SHEAR and GENERAL. The default value is SHEAR.

Return value

A SurfaceTraction object.

Exceptions

None.

`setValues(...)`

This method modifies the data for an existing SurfaceTraction object in the step where it is created.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *SurfaceTraction* method, except for the *name* and *createStepName* arguments.

Return value

`None.`

Exceptions

None.

setValuesInStep(...)

This method modifies the propagating data for an existing SurfaceTraction object in the specified step.

Required arguments

stepName A String specifying the name of the step in which the load is modified.

Optional arguments

magnitude A Float, a Complex, or the SymbolicConstant UNCHANGED specifying the load magnitude. UNCHANGED should be used if the magnitude is propagated from the previous analysis step.

amplitude A String or a SymbolicConstant specifying the name of the amplitude reference. Possible values for the SymbolicConstant are UNCHANGED and FREED. UNCHANGED should be used if the amplitude is propagated from the previous analysis step. FREED should be used if the load has no amplitude reference. You should provide the *amplitude* argument only if it is valid for the specified step.

Return value

`None.`

Exceptions

None.

Members

The SurfaceTraction object can have the following members:

name A String specifying the load repository key.

angle A Float specifying an additional rotation of *directionVector* about an axis. The default value is 0.0.

axis A SymbolicConstant specifying the axis about which to apply an additional rotation of *directionVector*. Possible values are AXIS_1, AXIS_2, and AXIS_3. The default value is AXIS_1.

follower A Boolean specifying whether the direction of the force changes with rotation. The default value is ON.

This parameter may be modified only if *traction* is GENERAL. You should provide the *follower* argument only if it is valid for the specified step.

resultant

A Boolean specifying whether the to maintain a constant resultant force by defining traction per unit undeformed area. If *resultant* is OFF, traction is defined per unit deformed area. The default value is OFF.

You should provide the *resultant* argument only if it is valid for the specified step.

traction

A SymbolicConstant specifying how to apply surface traction. Possible values are SHEAR and GENERAL. The default value is SHEAR.

distributionType

A SymbolicConstant specifying how the surface traction is distributed spatially. Possible values are UNIFORM, USER_DEFINED, and FIELD. The default value is UNIFORM.

field

A String specifying the name of the *AnalyticalField* object associated with this load. The *field* argument applies only when *distributionType*=FIELD. The default value is an empty string.

userCsys

A String specifying a CSYS defined by a user-subroutine. If *userCsys*=`None`, the degrees of freedom are defined in the global coordinate system or by the *localCsys* parameter if defined. The default value is "None".

localCsys

`None` or a *DatumCsys* object specifying the local coordinate system of the load's degrees of freedom. If *localCsys*=`None`, the degrees of freedom are defined in the global coordinate system or by the *userCsys* parameter if defined. When this member is queried, it returns an Int. The default value is `None`.

directionVector

A *VertexArray* object of length 2 specifying the direction of the load. Instead of through a *Vertex*, each point may be specified through a tuple of coordinates. If *traction* is SHEAR, then *directionVector* will be projected onto the region surface. This parameter is available only if *traction* is GENERAL or SHEAR.

region

A *Region* object specifying the region to which the load is applied.

SurfaceTractionState object

The SurfaceTractionState object stores the propagating data for a *SurfaceTraction* object in a step. One instance of this object is created internally by the *SurfaceTraction* object for each step. The instance is also deleted internally by the *SurfaceTraction* object.

The SurfaceTractionState object has no constructor or methods.

The SurfaceTractionState object is derived from the *LoadState* object.

Access

```
import load
mdb.models[name].steps[name].loadStates[name]
```

Members

The SurfaceTractionState object has the following members:

magnitude

A Float or a Complex specifying the load magnitude.

magnitudeState

A SymbolicConstant specifying the propagation state of the load magnitude. Possible values are UNSET, SET, UNCHANGED, and MODIFIED.

amplitudeState

A SymbolicConstant specifying the propagation state of the *amplitude* member. Possible values are UNSET, SET, UNCHANGED, and FREED.

status

A SymbolicConstant specifying the propagation state of the *LoadState* object. Possible values are:

- NOT_YET_ACTIVE
- CREATED
- PROPAGATED
- MODIFIED
- DEACTIVATED
- NO_LONGER_ACTIVE
- TYPE_NOT_APPLICABLE
- INSTANCE_NOT_APPLICABLE
- BUILT_INTO_BASE_STATE

amplitude

A String specifying the name of the amplitude reference. The String is empty if the load has no amplitude reference.

Material object

A Material object is the object used to specify a material. The Material object stores the various settings that determine how a material behaves.

A material is created by combining one or more individual material options and sub options. A particular material option is associated with the Material object through a member. For example: the *acousticMedium* member may contain an AcousticMedium object. The alternative of having a MaterialOption abstract base class and a container of MaterialOptions was rejected because it would make it more difficult to enforce the fact that one Material object cannot contain two AcousticMedium objects, for example.

Access

```
import material
mdb.models[name].materials[name]
import odbMaterial
session.odbs[name].materials[name]
```

Material(...)

This method creates a Material object.

Path

```
mdb.models[name].Material
session.odbs[name].Material
```

Required arguments

name
A String specifying the name of the new material.

Optional arguments

description
A String specifying user description of the material. The default value is an empty string.

materialIdentifier
A String specifying material identifier for customer use. The default value is an empty string.

Return value

A Material object.

Exceptions

InvalidNameError.

materialsFromOdb(...)

This methods creates Material objects by reading an output database. The new materials are placed in the materials repository.

Path

mdb.models[*name*].materialsFromOdb

Required arguments

fileName A String specifying the name of the output database file (including the `.odb` extension) to be read. This String can also be the full path to the output database file if it is located in another directory.

Optional arguments

None.

Return value

A list of Material objects.

Exceptions

None.

Members

The Material object has members with the same names and descriptions as the arguments to the *Material* method.

In addition, the Material object can have the following members:

acousticMedium An *AcousticMedium* object.

brittleCracking A *BrittleCracking* object.

capPlasticity A *CapPlasticity* object.

castIronPlasticity A *CastIronPlasticity* object.

clayPlasticity A *ClayPlasticity* object.

concrete A *Concrete* object.

concreteDamagedPlasticity A *ConcreteDamagedPlasticity* object.

conductivity A *Conductivity* object.

creep A *Creep* object.

crushableFoam A *CrushableFoam* object.

crushStress A *CrushStress* object.

CrushStressVelocityFactor A *CrushStressVelocityFactor* object.

ductileDamageInitiation A *DamageInitiation* object.

fldDamageInitiation A *DamageInitiation* object.

flsdDamageInitiation A *DamageInitiation* object.

johnsonCookDamageInitiation A *DamageInitiation* object.

maxeDamageInitiation A *DamageInitiation* object.

maxsDamageInitiation A *DamageInitiation* object.

maxpeDamageInitiation A *DamageInitiation* object.

maxpsDamageInitiation A *DamageInitiation* object.

mkDamageInitiation A *DamageInitiation* object.

msfldDamageInitiation A *DamageInitiation* object.

quadeDamageInitiation A *DamageInitiation* object.

quadsDamageInitiation A *DamageInitiation* object.

shearDamageInitiation A *DamageInitiation* object.

hashinDamageInitiation A *DamageInitiation* object.

damping A *Damping* object.

deformationPlasticity A *DeformationPlasticity* object.

density A *Density* object.

depvar A *Depvar* object.

dielectric A *Dielectric* object.

diffusivity A *Diffusivity* object.

druckerPrager A *DruckerPrager* object.

elastic An *Elastic* object.

electricalConductivity An *ElectricalConductivity* object.

eos An *Eos* object.

expansion An *Expansion* object.

fluidLeakoff A *FluidLeakoff* object.

gapFlow A *GapFlow* object.

gasketThicknessBehavior A *GasketThicknessBehavior* object.

gasketTransverseShearElastic A *GasketTransverseShearElastic* object.

gasketMembraneElastic A *GasketMembraneElastic* object.

gel A *Gel* object.

heatGeneration A *HeatGeneration* object.

hyperelastic A *Hyperelastic* object.

hyperfoam A *Hyperfoam* object.

hypoelastic A *Hypoelastic* object.

inelasticHeatFraction An *InelasticHeatFraction* object.

jouleHeatFraction A *JouleHeatFraction* object.

latentHeat A *LatentHeat* object.

lowDensityFoam A *LowDensityFoam* object.

magneticPermeability A *MagneticPermeability* object.

mohrCoulombPlasticity A *MohrCoulombPlasticity* object.

moistureSwelling A *MoistureSwelling* object.

mullinsEffect A *MullinsEffect* object.

permeability A *Permeability* object.

piezoelectric A *Piezoelectric* object.

plastic A *Plastic* object.

poreFluidExpansion A *PoreFluidExpansion* object.

porousBulkModuli A *PorousBulkModuli* object.

porousElastic	A *PorousElastic* object.
porousMetalPlasticity	A *PorousMetalPlasticity* object.
regularization	A *Regularization* object.
solubility	A *Solubility* object.
sorption	A *Sorption* object.
specificHeat	A *SpecificHeat* object.
swelling	A *Swelling* object.
userDefinedField	A *UserDefinedField* object.
userMaterial	A *UserMaterial* object.
userOutputVariables	A *UserOutputVariables* object.
viscoelastic	A *Viscoelastic* object.
viscosity	A *Viscosity* object.
viscous	A *Viscous* object.

AcousticMedium object

The AcousticMedium object specifies the acoustic properties of a material.

Access

```
import material
mdb.models[name].materials[name].acousticMedium
import odbMaterial
session.odbs[name].materials[name].acousticMedium
```

AcousticMedium(...)

This method creates an AcousticMedium object.

Path

```
mdb.models[name].materials[name].AcousticMedium
session.odbs[name].materials[name].AcousticMedium
```

Required arguments

None.

Optional arguments

acousticVolumetricDrag

A Boolean specifying whether the volumetricTable data is specified. The default value is OFF.

temperatureDependencyB

A Boolean specifying whether the data in *bulkTable* depend on temperature. The default value is OFF.

temperatureDependencyV

A Boolean specifying whether the data in *volumetricTable* depend on temperature. The default value is OFF.

dependenciesB

An Int specifying the number of field variable dependencies for the data in *bulkTable*. The default value is 0.

dependenciesV

An Int specifying the number of field variable dependencies for the data in *volumetricTable*. The default value is 0.

bulkTable

A sequence of sequences of Floats specifying the following:

- Bulk modulus.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

The default value is an empty sequence.

volumetricTable

A sequence of sequences of Floats specifying the following:

- Volumetric drag.
- Frequency.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

The default value is an empty sequence.

Return value

An AcousticMedium object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the AcousticMedium object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *AcousticMedium* method.

Return value

`None.`

Exceptions

RangeError.

Members

The AcousticMedium object has members with the same names and descriptions as the arguments to the *AcousticMedium* method.

Corresponding analysis keywords

- **ACOUSTIC MEDIUM*

AnnealTemperature object

The AnnealTemperature object specifies the material annealing temperature.

Access

```
import material
mdb.models[name].materials[name].plastic.annealTemperature
import odbMaterial
session.odbs[name].materials[name].plastic.annealTemperature
```

AnnealTemperature(...)

This method creates an AnnealTemperature object.

Path

```
mdb.models[name].materials[name].plastic.AnnealTemperature
session.odbs[name].materials[name].plastic.AnnealTemperature
```

Required arguments

table
A sequence of sequences of Floats specifying the items described below.

Optional arguments

dependencies
An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- The annealing temperature, θ.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

An AnnealTemperature object.

Exceptions

RangeError.

setValues(...)

This method modifies the AnnealTemperature object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *AnnealTemperature* method.

Return value

`None.`

Exceptions

RangeError.

Members

The AnnealTemperature object has members with the same names and descriptions as the arguments to the *AnnealTemperature* method.

Corresponding analysis keywords

- **ANNEAL TEMPERATURE*

BiaxialTestData object

The BiaxialTestData object provides equibiaxial test data (compression and/or tension).

Access

```
import material
mdb.models[name].materials[name].hyperelastic.biaxialTestData
mdb.models[name].materials[name].hyperfoam.biaxialTestData
mdb.models[name].materials[name].mullinsEffect.biaxialTests[i]
import odbMaterial
session.odbs[name].materials[name].hyperelastic.biaxialTestData
session.odbs[name].materials[name].hyperfoam.biaxialTestData
session.odbs[name].materials[name].mullinsEffect.biaxialTests[i]
```

BiaxialTestData(...)

This method creates a BiaxialTestData object.

Path

```
mdb.models[name].materials[name].hyperelastic.BiaxialTestData
mdb.models[name].materials[name].hyperfoam.BiaxialTestData
mdb.models[name].materials[name].mullinsEffect.BiaxialTestData
session.odbs[name].materials[name].hyperelastic.BiaxialTestData
session.odbs[name].materials[name].hyperfoam.BiaxialTestData
session.odbs[name].materials[name].mullinsEffect.BiaxialTestData
```

Required arguments

table

A sequence of sequences of Floats specifying the following:

- Nominal stress, T_B.
- Nominal strain, ϵ_B.

Optional arguments

smoothing

`None` or an Int specifying the value for smoothing. If *smoothing*=`None`, no smoothing is employed. The default value is `None`.

lateralNominalStrain

A Boolean specifying whether to include lateral nominal strain. The default value is OFF.

temperatureDependency

A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies

An Int specifying the number of field variable dependencies. The default value is 0.

Return value

A BiaxialTestData object.

Exceptions

None.

setValues(...)

This method modifies the BiaxialTestData object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *BiaxialTestData* method.

Return value

`None.`

Exceptions

None.

Members

The BiaxialTestData object has members with the same names and descriptions as the arguments to the *BiaxialTestData* method.

Corresponding analysis keywords

- **BIAXIAL TEST DATA*

BrittleCracking object

The BrittleCracking object specifies cracking and postcracking properties for the brittle cracking material model.

Access

```
import material
mdb.models[name].materials[name].brittleCracking
import odbMaterial
session.odbs[name].materials[name].brittleCracking
```

BrittleCracking(...)

This method creates a BrittleCracking object.

Path

```
mdb.models[name].materials[name].BrittleCracking
session.odbs[name].materials[name].BrittleCracking
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

type A SymbolicConstant specifying the type of postcracking behavior. Possible values are STRAIN, DISPLACEMENT, and GFI. The default value is STRAIN.

Table data

If *type*=STRAIN the table data specify the following:

- Remaining direct stress after cracking.
- Direct cracking strain.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=DISPLACEMENT the table data specify the following:

- Remaining direct stress after cracking.
- Direct cracking displacement.

- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=GFI the table data specify the following:

- Failure stress.
- Mode I fracture energy.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A BrittleCracking object.

Exceptions

None.

`setValues(...)`

This method modifies the BrittleCracking object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *BrittleCracking* method.

Return value

`None.`

Exceptions

None.

Members

The BrittleCracking object has members with the same names and descriptions as the arguments to the *BrittleCracking* method.

In addition, the BrittleCracking object can have the following members:

brittleShear A *BrittleShear* object.

brittleFailure A *BrittleFailure* object.

Corresponding analysis keywords

- **BRITTLE CRACKING*

BrittleFailure object

The BrittleFailure object specifies the brittle failure of the material.

Access

```
import material
mdb.models[name].materials[name].brittleCracking.brittleFailure
import odbMaterial
session.odbs[name].materials[name].brittleCracking.brittleFailure
```

BrittleFailure(...)

This method creates a BrittleFailure object.

Path

```
mdb.models[name].materials[name].brittleCracking.BrittleFailure
session.odbs[name].materials[name].brittleCracking.BrittleFailure
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

failureCriteria A SymbolicConstant specifying the failure criteria. Possible values are UNIDIRECTIONAL, BIDIRECTIONAL, and TRIDIRECTIONAL. The default value is UNIDIRECTIONAL.

Table data

If parent *BrittleCracking* member *type*=STRAIN the table data specify the following:

- Direct cracking failure strain.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If parent *BrittleCracking* member *type*=DISPLACEMENT or *type*=GFI the table data specify the following:

- Direct cracking failure displacement.
- Temperature, if the data depend on temperature.

- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A BrittleFailure object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the BrittleFailure object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *BrittleFailure* method.

Return value

`None.`

Exceptions

RangeError.

Members

The BrittleFailure object has members with the same names and descriptions as the arguments to the *BrittleFailure* method.

Corresponding analysis keywords

- **BRITTLE FAILURE*

BrittleShear object

The BrittleShear object specifies the postcracking shear behavior of a material used in a brittle cracking model.

Access

```
import material
mdb.models[name].materials[name].brittleCracking.brittleShear
import odbMaterial
session.odbs[name].materials[name].brittleCracking.brittleShear
```

BrittleShear(...)

This method creates a BrittleShear object.

Path

```
mdb.models[name].materials[name].brittleCracking.BrittleShear
session.odbs[name].materials[name].brittleCracking.BrittleShear
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

type A SymbolicConstant specifying the type of postcracking shear behavior. Possible values are RETENTION_FACTOR and POWER_LAW. The default value is RETENTION_FACTOR.

Table data

If *type*=RETENTION_FACTOR the table data specify the following:

- Shear retention factor.
- Crack opening strain.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=POWER_LAW the table data specify the following:

- e.
- p.

- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A BrittleShear object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the BrittleShear object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *BrittleShear* method.

Return value

`None.`

Exceptions

RangeError.

Members

The BrittleShear object has members with the same names and descriptions as the arguments to the *BrittleShear* method.

Corresponding analysis keywords

- **BRITTLE SHEAR*

CapCreepCohesion object

The CapCreepCohesion object specifies a cap creep model and material properties.

Access

```
import material
mdb.models[name].materials[name].capPlasticity.capCreepCohesion
import odbMaterial
session.odbs[name].materials[name].capPlasticity.capCreepCohesion
```

CapCreepCohesion(...)

This method creates a CapCreepCohesion object.

Path

```
mdb.models[name].materials[name].capPlasticity.CapCreepCohesion
session.odbs[name].materials[name].capPlasticity.CapCreepCohesion
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

law A SymbolicConstant specifying the cap creep law. Possible values are STRAIN, TIME, SINGHM, USER, POWER_LAW, and TIME_POWER_LAW. The default value is STRAIN.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

time A SymbolicConstant specifying the time increment for the relevant laws. Possible values are CREEP and TOTAL. The default value is TOTAL.

Table data

If *law*=STRAIN or *law*=TIME, the table data specify the following:

- A.
- n.
- m.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *law*=SINGHM, the table data specify the following:

- A.
- α.
- m.
- t_1.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *law*=POWER_LAW or *law*=TIME_POWER_LAW, the table data specify the following:

- q_o.
- n.
- m.
- $\dot{\varepsilon}_o$.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A CapCreepCohesion object.

Exceptions

None.

setValues(...)

This method modifies the CapCreepCohesion object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *CapCreepCohesion* method.

Return value

`None.`

Exceptions

None.

Members

The CapCreepCohesion object has members with the same names and descriptions as the arguments to the *CapCreepCohesion* method.

Corresponding analysis keywords

- **CAP CREEP*

CapCreepConsolidation object

The CapCreepConsolidation object specifies a cap creep model and material properties.

Access

```
import material
mdb.models[name].materials[name].capPlasticity.capCreepConsolidation
import odbMaterial
session.odbs[name].materials[name].capPlasticity.capCreepConsolidation
```

CapCreepConsolidation(...)

This method creates a CapCreepConsolidation object.

Path

```
mdb.models[name].materials[name].capPlasticity.CapCreepConsolidation
session.odbs[name].materials[name].capPlasticity.CapCreepConsolidation
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

law A SymbolicConstant specifying the cap creep law. Possible values are STRAIN, TIME, SINGHM, and USER. The default value is STRAIN.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

time A SymbolicConstant specifying the time increment for the relevant laws. Possible values are CREEP and TOTAL. The default value is TOTAL.

Table data

If *law*=STRAIN or *law*=TIME, the table data specify the following:

- A.
- n.
- m.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *law*=SINGHM, the table data specify the following:

- A.
- α.
- m.
- t_1.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *law*=POWER_LAW or *law*=TIME_POWER_LAW, the table data specify the following:

- q_o.
- n.
- m.
- $\dot{\varepsilon}_o$.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A CapCreepConsolidation object.

Exceptions

None.

setValues(...)

This method modifies the CapCreepConsolidation object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *CapCreepConsolidation* method.

Return value

`None.`

Exceptions

None.

Members

The CapCreepConsolidation object has members with the same names and descriptions as the arguments to the *CapCreepConsolidation* method.

Corresponding analysis keywords

- **CAP CREEP*

CapHardening object

The CapHardening object specifies Drucker-Prager/Cap plasticity hardening.

Access

```
import material
mdb.models[name].materials[name].capPlasticity.capHardening
import odbMaterial
session.odbs[name].materials[name].capPlasticity.capHardening
```

CapHardening(...)

This method creates a CapHardening object.

Path

```
mdb.models[name].materials[name].capPlasticity.CapHardening
session.odbs[name].materials[name].capPlasticity.CapHardening
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- Hydrostatic pressure yield stress.
- Absolute value of the corresponding volumetric inelastic strain.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A CapHardening object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the CapHardening object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *CapHardening* method.

Return value

`None.`

Exceptions

RangeError.

Members

The CapHardening object has members with the same names and descriptions as the arguments to the *CapHardening* method.

Corresponding analysis keywords

- **CAP HARDENING*

CapPlasticity object

The CapPlasticity object specifies the modified Drucker-Prager/Cap plasticity model.

Access

```
import material
mdb.models[name].materials[name].capPlasticity
import odbMaterial
session.odbs[name].materials[name].capPlasticity
```

CapPlasticity(...)

This method creates a CapPlasticity object.

Path

```
mdb.models[name].materials[name].CapPlasticity
session.odbs[name].materials[name].CapPlasticity
```

Required arguments

table
A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency
A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- Material cohesion, d, in the p–t plane (Abaqus/Standard) or in the p–q plane (Abaqus/Explicit).
- Material angle of friction, β, in the p–t plane (Abaqus/Standard) or in the p–q plane (Abaqus/Explicit). Give the value in degrees.
- Cap eccentricity parameter, R. Its value must be greater than zero (typically $0.0 < R < 1.0$).
- Initial cap yield surface position, $\varepsilon_{vol}^{pl}\big|_0$.
- Transition surface radius parameter, α. The default value is 0.0 (i.e., no transition surface).
- (Not used in Abaqus/Explicit) K, the ratio of the flow stress in triaxial tension to the flow stress in triaxial compression. Possible values are $0.778 \le K \le 1.0$. If the default value of 0.0 is accepted, Abaqus/Standard assumes $K = 1.0$.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.

- Etc.

Return value

A CapPlasticity object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the CapPlasticity object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *CapPlasticity* method.

Return value

`None.`

Exceptions

RangeError.

Members

The CapPlasticity object has members with the same names and descriptions as the arguments to the *CapPlasticity* method.

In addition, the CapPlasticity object can have the following members:

capCreepCohesion	A *CapCreepCohesion* object.
capCreepConsolidation	A *CapCreepConsolidation* object.
capHardening	A *CapHardening* object.

Corresponding analysis keywords

- **CAP PLASTICITY*

CastIronCompressionHardening object

The CastIronCompressionHardening object specifies hardening for the Cast- Iron plasticity model.

Access

```
import material
mdb.models[name].materials[name].castIronPlasticity\
.castIronCompressionHardening
import odbMaterial
session.odbs[name].materials[name].castIronPlasticity\
.castIronCompressionHardening
```

session.odbs[name].materials[name].castIronPlasticity\
.CastIronCompressionHardening
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- Yield stress in compression, σ_c.
- The absolute value of the corresponding plastic strain.(The first tabular value entered must always be zero.)
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A CastIronCompressionHardening object.

Exceptions

RangeError.

setValues(...)

This method modifies the CastIronCompressionHardening object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *CastIronCompressionHardening* method.

Return value

`None.`

Exceptions

RangeError.

Members

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

The table data specify the following:

- Plastic Poisson's ratio, ν_{pl} (dimensionless).
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A CastIronPlasticity object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the CastIronPlasticity object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *CastIronPlasticity* method.

Return value

`None.`

Exceptions

RangeError.

Members

The CastIronPlasticity object has members with the same names and descriptions as the arguments to the *CastIronPlasticity* method.

In addition, the CastIronPlasticity object can have the following members:

castIronTensionHardening — A *CastIronTensionHardening* object.

castIronCompressionHardening — A *CastIronCompressionHardening* object.

Corresponding analysis keywords

```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- Yield stress in uniaxial tension, σ_t.
- The absolute value of the corresponding plastic strain.(The first tabular value entered must always be zero.)
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A CastIronTensionHardening object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the CastIronTensionHardening object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *CastIronTensionHardening* method.

Return value

`None.`

Exceptions

RangeError.

Members

The CastIronTensionHardening object has members with the same names and descriptions as the arguments to the *CastIronTensionHardening* method.

Corresponding analysis keywords

- **CAST IRON TENSION HARDENING*

ClayHardening object

The ClayHardening object specifies hardening for the clay plasticity model.

Access

```
import material
mdb.models[name].materials[name].clayPlasticity.clayHardening
import odbMaterial
session.odbs[name].materials[name].clayPlasticity.clayHardening
```

ClayHardening(...)

This method creates a ClayHardening object.

Path

```
mdb.models[name].materials[name].clayPlasticity.ClayHardening
session.odbs[name].materials[name].clayPlasticity.ClayHardening
```

Required arguments

table
A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency
A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- The hydrostatic pressure stress at yield, p_c.
- The absolute value of the corresponding volumetric plastic strain.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A ClayHardening object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the ClayHardening object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ClayHardening* method.

Return value

`None.`

Exceptions

RangeError.

Members

The ClayHardening object has members with the same names and descriptions as the arguments to the *ClayHardening* method.

Corresponding analysis keywords

- **CLAY HARDENING*

ClayPlasticity object

The ClayPlasticity object specifies the extended Cam-clay plasticity model.

Access

```
import material
mdb.models[name].materials[name].clayPlasticity
import odbMaterial
session.odbs[name].materials[name].clayPlasticity
```

ClayPlasticity(...)

This method creates a ClayPlasticity object.

Path

```
mdb.models[name].materials[name].ClayPlasticity
session.odbs[name].materials[name].ClayPlasticity
```

Required arguments

table
A sequence of sequences of Floats specifying the items described below.

Optional arguments

intercept
`None` or a Float specifying e_1, the intercept of the virgin consolidation line with the void ratio axis in a plot of void ratio versus the logarithm of pressure stress. The default value is `None`.

This argument is valid only if *hardening*=EXPONENTIAL.

hardening
A SymbolicConstant specifying the type of hardening/softening definition. Possible values are EXPONENTIAL and TABULAR. The default value is EXPONENTIAL.

temperatureDependency
A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of field variable dependencies. The default value is 0.

Table data

If *hardening*=EXPONENTIAL, the table data specify the following:

- Logarithmic plastic bulk modulus, λ (dimensionless).
- Stress ratio at critical state, M.
- The initial yield surface size, α_0.
- β, the parameter defining the size of the yield surface on the “wet” side of critical state.
- K, the ratio of the flow stress in triaxial tension to the flow stress in triaxial compression. $0.778 \leq K \leq 1.0$. If the default value of 0.0 is accepted, a value of 1.0 is assumed.

- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *hardening*=TABULAR, the table data specify the following:

- Stress ratio at critical state, M.
- The initial volumetric plastic strain, $\varepsilon_{\text{vol}}^{pl}\big|_0$, corresponding to $p_c|_0$ according to the *ClayHardening* definition.
- β, the parameter defining the size of the yield surface on the "wet" side of critical state.
- K, the ratio of the flow stress in triaxial tension to the flow stress in triaxial compression. $0.778 \leq K \leq 1.0$.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A ClayPlasticity object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the ClayPlasticity object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ClayPlasticity* method.

Return value

`None.`

Exceptions

RangeError.

Members

The ClayPlasticity object has members with the same names and descriptions as the arguments to the *ClayPlasticity* method.

In addition, the ClayPlasticity object can have the following member:

clayHardening	A *ClayHardening* object.

Corresponding analysis keywords

CombinedTestData object

The CombinedTestData object specifies simultaneously the normalized shear and bulk compliances or relaxation moduli as functions of time.

Access

```
import material
mdb.models[name].materials[name].viscoelastic.combinedTestData
import odbMaterial
session.odbs[name].materials[name].viscoelastic.combinedTestData
```

CombinedTestData(...)

This method creates a CombinedTestData object.

Path

```
mdb.models[name].materials[name].viscoelastic.CombinedTestData
session.odbs[name].materials[name].viscoelastic.CombinedTestData
```

Required arguments

table

A sequence of sequences of Floats specifying the items described below. The values of the table data depend on the value of the *time* member of the *Viscoelastic* object.

Optional arguments

volinf

`None` or a Float specifying a normalized volume. The value of *volinf* depends on the value of the *time* member of the *Viscoelastic* object. The default value is `None`.

If *time*=RELAXATION_TEST_DATA, *volinf* specifies the value of the long-term normalized volumetric modulus, $k_R(\infty)$.

If *time*=CREEP_TEST_DATA, *volinf* specifies the value of the long-term normalized volumetric compliance, $j_K(\infty)$.

shrinf

`None` or a Float specifying a normalized shear. The value of *shrinf* depends on the value of the *time* member of the *Viscoelastic* object. The default value is `None`.

If *time*=RELAXATION_TEST_DATA, *shrinf* specifies the value of the long-term normalized shear modulus, $g_R(\infty)$.

If *time*=CREEP_TEST_DATA, *shrinf* specifies the value of the long-term normalized shear compliance, $j_S(\infty)$.

Table data

If *time*=RELAXATION_TEST_DATA, the table data specify the following:

- Normalized shear modulus, $g_R(t)(0 \le g_R(t) \le 1)$.

- Normalized volumetric (bulk) modulus, $k_R\,(t) (0 \le k_R\,(t) \le 1)$.
- Time $t (t > 0)$.

If *time*=CREEP_TEST_DATA, the table data specify the following:

- Normalized shear compliance, $j_S\,(t) (j_S\,(t) \ge 1)$.
- Normalized volumetric (bulk) compliance, $j_K\,(t) (j_K\,(t) \ge 1)$.
- Time $t (t > 0)$.

Return value

A CombinedTestData object.

Exceptions

None.

`setValues(...)`

This method modifies the CombinedTestData object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *CombinedTestData* method.

Return value

`None.`

Exceptions

None.

Members

The CombinedTestData object has members with the same names and descriptions as the arguments to the *CombinedTestData* method.

Corresponding analysis keywords

- **COMBINED TEST DATA*

Concrete object

The Concrete object defines concrete properties beyond the elastic range.

Access

```
import material
mdb.models[name].materials[name].concrete
import odbMaterial
session.odbs[name].materials[name].concrete
```

Concrete(...)

This method creates a Concrete object.

Path

```
mdb.models[name].materials[name].Concrete
session.odbs[name].materials[name].Concrete
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- Absolute value of compressive stress.
- Absolute value of plastic strain.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A Concrete object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the Concrete object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Concrete* method.

Return value

`None.`

Exceptions

RangeError.

Members

The Concrete object has members with the same names and descriptions as the arguments to the *Concrete* method.

In addition, the Concrete object can have the following members:

failureRatios	A *FailureRatios* object.
shearRetention	A *ShearRetention* object.
tensionStiffening	A *TensionStiffening* object.

Corresponding analysis keywords

- **CONCRETE*

ConcreteCompressionDamage object

The ConcreteCompressionDamage object specifies hardening for the concrete damaged plasticity model.

Access

```
import material
mdb.models[name].materials[name].concreteDamagedPlasticity\
.concreteCompressionDamage
import odbMaterial
session.odbs[name].materials[name].concreteDamagedPlasticity\
.concreteCompressionDamage
```

ConcreteCompressionDamage(...)

This method creates a ConcreteCompressionDamage object.

Path

```
mdb.models[name].materials[name].concreteDamagedPlasticity\
.ConcreteCompressionDamage
session.odbs[name].materials[name].concreteDamagedPlasticity\
.ConcreteCompressionDamage
```

Required arguments

table
A sequence of sequences of Floats specifying the items described below.

Optional arguments

tensionRecovery
A Float specifying the value of the stiffness recovery factor, w_t, that determines the amount of tension stiffness that is recovered as loading changes from compression to tension. The default value is 0.0.

temperatureDependency
A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- Compressive damage variable, d_c.
- Inelastic (crushing) strain, ϵ_c^{in}.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A ConcreteCompressionDamage object.

Exceptions

RangeError.

setValues(...)

This method modifies the ConcreteCompressionDamage object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConcreteCompressionDamage* method.

Return value

`None.`

Exceptions

RangeError.

Members

The ConcreteCompressionDamage object has members with the same names and descriptions as the arguments to the *ConcreteCompressionDamage* method.

Corresponding analysis keywords

- **CONCRETE COMPRESSION DAMAGE*

ConcreteCompressionHardening object

The ConcreteCompressionHardening object specifies hardening for the concrete damaged plasticity model.

Access

```
import material
mdb.models[name].materials[name].concreteDamagedPlasticity\
.concreteCompressionHardening
import odbMaterial
session.odbs[name].materials[name].concreteDamagedPlasticity\
.concreteCompressionHardening
```

ConcreteCompressionHardening(...)

This method creates a ConcreteCompressionHardening object.

Path

```
mdb.models[name].materials[name].concreteDamagedPlasticity\
.ConcreteCompressionHardening
session.odbs[name].materials[name].concreteDamagedPlasticity\
.ConcreteCompressionHardening
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

rate A Boolean specifying whether the data depend on rate. The default value is OFF.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- Yield stress in compression, σ_c.
- Inelastic (crushing) strain, ϵ_c^{in}.
- Inelastic (crushing) strain rate, $\dot{\epsilon}_c^{in}$.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A ConcreteCompressionHardening object.

Exceptions

RangeError.

setValues(...)

This method modifies the ConcreteCompressionHardening object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConcreteCompressionHardening* method.

Return value

`None.`

Exceptions

RangeError.

Members

The ConcreteCompressionHardening object has members with the same names and descriptions as the arguments to the *ConcreteCompressionHardening* method.

Corresponding analysis keywords

- **CONCRETE COMPRESSION HARDENING*

ConcreteDamagedPlasticity object

The ConcreteDamagedPlasticity object specifies the concrete damaged plasticity model.

Access

```
import material
mdb.models[name].materials[name].concreteDamagedPlasticity
import odbMaterial
session.odbs[name].materials[name].concreteDamagedPlasticity
```

ConcreteDamagedPlasticity(...)

This method creates a ConcreteDamagedPlasticity object.

Path

```
mdb.models[name].materials[name].ConcreteDamagedPlasticity

```

Required arguments

table
A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency
A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of field variable dependencies. The default value is 0.

Table data

The table data specify the following:

- Dilation angle, ψ (in degrees) in the p–q plane.
- Flow potential eccentricity, ϵ. The default value is 0.1.
- σ_{b0}/σ_{t0}, the ratio of initial equibiaxial compressive yield stress to initial uniaxial compressive yield stress. The default value is 1.16.
- K_c, the ratio of the second stress invariant on the tensile meridian, to that on the compressive meridian, at initial yield for any given value of the pressure invariant p such that the maximum principal stress is negative. The default value is 2/3.
- Viscosity parameter, μ, used for the viscoplastic regularization of the concrete constitutive equations in an Abaqus/Standard analysis. This parameter is ignored in an Abaqus/Explicit analysis. The default value is 0.0.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.

- Etc.

Return value

A ConcreteDamagedPlasticity object.

Exceptions

RangeError.

setValues(...)

This method modifies the ConcreteDamagedPlasticity object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConcreteDamagedPlasticity* method.

Return value

`None.`

Exceptions

RangeError.

Members

The ConcreteDamagedPlasticity object has members with the same names and descriptions as the arguments to the *ConcreteDamagedPlasticity* method.

In addition, the ConcreteDamagedPlasticity object can have the following members:

concreteCompressionHardening	A *ConcreteCompressionHardening* object.
concreteTensionStiffening	A *ConcreteTensionStiffening* object.
concreteCompressionDamage	A *ConcreteCompressionDamage* object.
concreteTensionDamage	A *ConcreteTensionDamage* object.

Corresponding analysis keywords

```

Required arguments

table
A sequence of sequences of Floats specifying the items described below.

Optional arguments

compressionRecovery
A Float specifying the value of the stiffness recovery factor, w_c, that determines the amount of compression stiffness that is recovered as loading changes from tension to compression. The default value is 1.0.

type
A SymbolicConstant specifying the type of tensile damage data. Set *type*=STRAIN to specify the tensile damage variable as a function of cracking strain. Set *type*=DISPLACEMENT to specify the tensile damage variable as a function of cracking displacement. Possible values are STRAIN and DISPLACEMENT. The default value is STRAIN.

temperatureDependency
A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of field variable dependencies. The default value is 0.

Table data

If *type*=STRAIN, the table data specify the following:

- Tensile damage variable, d_t.
- Direct cracking strain, ϵ_t^{ck}.

- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=DISPLACEMENT, the table data specify the following:

- Tensile damage variable, d_t.
- Direct cracking displacement, u_t^{ck}.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A ConcreteTensionDamage object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the ConcreteTensionDamage object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConcreteTensionDamage* method.

Return value

`None.`

Exceptions

RangeError.

session.odbs[name].materials[name].concreteDamagedPlasticity\
.ConcreteTensionStiffening
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

rate A Boolean specifying whether the data depend on rate. The default value is OFF.

type A SymbolicConstant specifying the type of postcracking behavior data. Possible values are:

- STRAIN, specifying postfailure stress as a function of cracking strain.
- DISPLACEMENT, specifying postfailure stress as a function of cracking displacement.
- GFI, specifying failure stress as a function of the fracture energy.

The default value is STRAIN.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

If *type*=STRAIN, the table data specify the following:

- Remaining direct stress after cracking, σ_t.
- Direct cracking strain, ϵ_t^{ck}.

- Direct cracking strain rate, $\dot{\epsilon}_t^{ck}$.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=DISPLACEMENT, the table data specify the following:

- Remaining direct stress after cracking, σ_t.
- Direct cracking displacement, u_t^{ck}.
- Direct cracking displacement rate, $\dot{u}_t^{ck}$.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=GFI, the table data specify the following:

- Failure stress, σ_{t0}.
- Fracture energy, G_f.
- Direct cracking displacement rate, $\dot{u}_t^{ck}$.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A ConcreteTensionStiffening object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the ConcreteTensionStiffening object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ConcreteTensionStiffening* method.

Return value
`None.`

Exceptions
RangeError.

Members
The ConcreteTensionStiffening object has members with the same names and descriptions as the arguments to the *ConcreteTensionStiffening* method.

Conductivity object

The Conductivity object specifies thermal conductivity.

Access

```
import material
mdb.models[name].materials[name].conductivity
import odbMaterial
session.odbs[name].materials[name].conductivity
```

Conductivity(...)

This method creates a Conductivity object.

Path

```
mdb.models[name].materials[name].Conductivity
session.odbs[name].materials[name].Conductivity
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

type A SymbolicConstant specifying the type of conductivity. Possible values are ISOTROPIC, ORTHOTROPIC, and ANISOTROPIC. The default value is ISOTROPIC.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

If *type*=ISOTROPIC, the table data specify the following:

- Conductivity, k.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=ORTHOTROPIC, the table data specify the following:

- k_{11}.
- k_{22}.

- k_{33}.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=ANISOTROPIC, the table data specify the following:

- k_{11}.
- k_{12}.
- k_{22}.
- k_{13}.
- k_{23}.
- k_{33}.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A Conductivity object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the Conductivity object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Conductivity* method.

Return value

`None.`

Exceptions

RangeError.

Members

The Conductivity object has members with the same names and descriptions as the arguments to the *Conductivity* method.

- **CONDUCTIVITY*

ContactArea object

A ContactArea object specifies a suboption of gasket thickness behavior when *variableUnits*=FORCE on the GasketThicknessBehavior object. The ContactArea object defines the contact area or contact width versus closure curves to output an average pressure through variable CS11.

Access

```
import material
mdb.models[name].materials[name].gasketThicknessBehavior.contactArea
import odbMaterial
session.odbs[name].materials[name].gasketThicknessBehavior.contactArea
```

ContactArea(...)

This method creates a ContactArea object.

Path

```
mdb.models[name].materials[name].gasketThicknessBehavior.ContactArea
session.odbs[name].materials[name].gasketThicknessBehavior.ContactArea
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency A Boolean specifying whether contact area data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies included in the definition of the contact area data, in addition to temperature. The default value is 0.

Table data

- Contact area or width; this value must be positive.
- Closure; this value must be positive.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A ContactArea object.

Exceptions

None.

`setValues(...)`

This method modifies the ContactArea object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ContactArea* method.

Return value

`None.`

Exceptions

None.

Members

The ContactArea object has members with the same names and descriptions as the arguments to the *ContactArea* method.

Corresponding analysis keywords

Creep object

The Creep object defines a creep law.

Access

```
import material
mdb.models[name].materials[name].creep
import odbMaterial
session.odbs[name].materials[name].creep
```

Creep(...)

This method creates a Creep object.

Path

```
mdb.models[name].materials[name].Creep
session.odbs[name].materials[name].Creep
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

law A SymbolicConstant specifying the strain-hardening law. Possible values are STRAIN, TIME, HYPERBOLIC_SINE, USER, ANAND, DARVEAUX,DOUBLE_POWER, POWER_LAW, and TIME_POWER_LAW. The default value is STRAIN.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

time A SymbolicConstant specifying the time interval for relevant laws. Possible values are CREEP and TOTAL. The default value is TOTAL.

Table data

If *law*=STRAIN or *law*=TIME, the table data specify the following:

- A.
- n.
- m.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *law*=HYPERBOLIC_SINE, the table data specify the following:

- A.
- B.
- n.
- $\triangle H$, if the data depend on temperature.
- R.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *law*=ANAND, the table data specify the following:

- s_1.
- $\frac{Q}{R}$.
- A.
- ξ.
- m.
- A_0.
- $\widehat{S}$.
- n.
- a.
- S_2.
- S_3.
- A_1.
- A_2.
- A_3.
- A_4.

If *law*=DARVEAUX, the table data specify the following:

- C_{ss}.
- $\frac{Q}{R}$.
- α.
- n.
- ϵ_T.
- B.

If *law*=DOUBLE_POWER, the table data specify the following:

- A_1.
- B_1.
- C_1.
- A_2.
- B_2.
- C_2.
- σ_0.

If *law*=POWER_LAW or *law*=TIME_POWER_LAW, the table data specify the following:

- q_0.
- n.
- m.
- $\dot{\varepsilon}_0$.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A Creep object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the Creep object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Creep* method.

Return value

`None.`

Exceptions

RangeError.

Members

The Creep object has members with the same names and descriptions as the arguments to the *Creep* method.

In addition, the Creep object can have the following members:

ornl

An *Ornl* object.

potential

A *Potential* object.

CrushableFoam object

The CrushableFoam object specifies the crushable foam plasticity model.

Access

```
import material
mdb.models[name].materials[name].crushableFoam
import odbMaterial
session.odbs[name].materials[name].crushableFoam
```

CrushableFoam(...)

This method creates a CrushableFoam object.

Path

```
mdb.models[name].materials[name].CrushableFoam
session.odbs[name].materials[name].CrushableFoam
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

hardening A SymbolicConstant specifying the type of hardening/softening definition. Possible values are VOLUMETRIC and ISOTROPIC. The default value is VOLUMETRIC.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

If *hardening*=VOLUMETRIC, the table data specify the following:

- Ratio, k, of initial yield stress in uniaxial compression, σ_c^0, to initial yield stress in hydrostatic compression, p_c^0; $0.0 < k < 3.0$.
- Ratio, k_t, of yield stress in hydrostatic tension, p_t, to initial yield stress in hydrostatic compression, p_c^0. The default value is 1.0.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *hardening*=ISOTROPIC, the table data specify the following:

- Ratio, k, of initial yield stress in uniaxial compression, σ_c^0, to initial yield stress in hydrostatic compression, p_c^0; $0.0 \leq k \leq 3.0$.
- Plastic Poisson's ratio.ν_p; $-1 \leq \nu_p \leq 0.5$.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A CrushableFoam object.

Exceptions

RangeError.

setValues(...)

This method modifies the CrushableFoam object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *CrushableFoam* method.

Return value

`None.`

Exceptions

RangeError.

Members

The CrushableFoam object has members with the same names and descriptions as the arguments to the *CrushableFoam* method.

In addition, the CrushableFoam object can have the following members:

crushableFoamHardening A *CrushableFoamHardening* object.

rateDependent A *RateDependent* object.

Corresponding analysis keywords

- **CRUSHABLE FOAM*

CrushableFoamHardening object

The CrushableFoamHardening object specifies hardening for the crushable foam plasticity model.

Access

```
import material
mdb.models[name].materials[name].crushableFoam.crushableFoamHardening
import odbMaterial
session.odbs[name].materials[name].crushableFoam\
.crushableFoamHardening
```

CrushableFoamHardening(...)

This method creates a CrushableFoamHardening object.

Path

```
mdb.models[name].materials[name].crushableFoam.CrushableFoamHardening
session.odbs[name].materials[name].crushableFoam\
.CrushableFoamHardening
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- The yield stress in uniaxial compression, σ_c.
- The absolute value of the corresponding plastic strain.(The first tabular value entered must always be zero.)
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A CrushableFoamHardening object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the CrushableFoamHardening object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *CrushableFoamHardening* method.

Return value

`None.`

Exceptions

RangeError.

Members

The CrushableFoamHardening object has members with the same names and descriptions as the arguments to the *CrushableFoamHardening* method.

Corresponding analysis keywords

- **CRUSHABLE FOAM HARDENING*

CrushStress object

The CrushStress object specifies the crush stress of a material.

Access

```
import material
mdb.models[name].materials[name].crushStress
import odbMaterial
session.odbs[name].materials[name].crushStress
```

CrushStress(...)

This method creates a CrushStress object.

Path

```
mdb.models[name].materials[name].CrushStress
session.odbs[name].materials[name].CrushStress
```

Required arguments

crushStressTable A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

The table data specify the following:

- Crush Stress.
- Material angle in degrees.
- Temperature if the data depend on temperature.
- Value of the first field variable if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A CrushStress object.

Exceptions

None.

setValues(...)

This method modifies the CrushStress object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *CrushStress* method.

Return value

`None.`

Exceptions

None.

Members

The CrushStress object has members with the same names and descriptions as the arguments to the *CrushStress* method.

In addition, the CrushStress object can have the following members:

crushStressVelocityFactor A *CrushStressVelocityFactor* object.

Corresponding analysis keywords

- **CRUSH STRESS*

CrushStressVelocityFactor object

The CrushStressVelocityFactor object defines how the approach velocity at a crushing interface influences a material's resistance to crushing.

Access

```
import material
mdb.models[name].materials[name].crushStress.crushStressVelocityFactor
import odbMaterial
session.odbs[name].materials[name].crushStress.crushStressVelocityFactor
```

CrushStressVelocityFactor(...)

This method creates a CrushStressVelocityFactor object.

Path

```
mdb.models[name].materials[name].crushStress.CrushStressVelocityFactor
session.odbs[name].materials[name].crushStress.CrushStressVelocityFactor
```

Required arguments

crushStressVelocityFactorTable	A sequence of sequences of Floats specifying the items described below.

Table data

The table data specify the following:

- Scaling factor.
- Relative velocity.

Return value

A CrushStressVelocityFactor object.

Exceptions

None.

setValues(...)

This method modifies the CrushStressVelocityFactor object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *CrushStressVelocityFactor* method.

Return value
`None.`

Exceptions
None.

Members
The CrushStressVelocityFactor object has members with the same names and descriptions as the arguments to the *CrushStressVelocityFactor* method.

Corresponding analysis keywords
- **CRUSH STRESS VELOCITY FACTOR*

CycledPlastic object

The CycledPlastic object specifies cycled yield stress data for the ORNL constitutive model.

Access

```
import material
mdb.models[name].materials[name].plastic.cycledPlastic
import odbMaterial
session.odbs[name].materials[name].plastic.cycledPlastic
```

CycledPlastic(...)

This method creates a CycledPlastic object.

Path

```
mdb.models[name].materials[name].plastic.CycledPlastic
session.odbs[name].materials[name].plastic.CycledPlastic
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

Table data

- Yield stress.
- Plastic strain.
- Temperature, if the data depend on temperature.

Return value

A CycledPlastic object.

Exceptions

None.

setValues(...)

This method modifies the CycledPlastic object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *CycledPlastic* method.

Return value

`None.`

Exceptions

None.

Members

The CycledPlastic object has members with the same names and descriptions as the arguments to the *CycledPlastic* method.

Corresponding analysis keywords

- **CYCLED PLASTIC*

CyclicHardening object

The CyclicHardening object defines the evolution of the elastic domain for the nonlinear isotropic/kinematic hardening model.

Access

```
import material
mdb.models[name].materials[name].plastic.cyclicHardening
import odbMaterial
session.odbs[name].materials[name].plastic.cyclicHardening
```

CyclicHardening(...)

This method creates a CyclicHardening object.

Path

```
mdb.models[name].materials[name].plastic.CyclicHardening
session.odbs[name].materials[name].plastic.CyclicHardening
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

parameters A Boolean specifying whether material parameters are to be input directly. The default value is OFF.

Table data

- Equivalent stress.
- Q_∞ (only if *parameters*=ON).
- Hardening parameter (only if *parameters*=ON).
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A CyclicHardening object.

Exceptions

None.

setValues(...)

This method modifies the CyclicHardening object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *CyclicHardening* method.

Return value

`None.`

Exceptions

None.

Members

The CyclicHardening object has members with the same names and descriptions as the arguments to the *CyclicHardening* method.

Corresponding analysis keywords

- **CYCLIC HARDENING*

DamageEvolution object

The DamageEvolution object specifies material properties to define the evolution of damage.

Access

Required arguments

type

A SymbolicConstant specifying the type of damage evolution. Possible values are DISPLACEMENT and ENERGY.

table

A sequence of sequences of Floats specifying the items described below.

Optional arguments

degradation
A SymbolicConstant specifying the degradation. Possible values are MAXIMUM and MULTIPLICATIVE. The default value is MAXIMUM.

temperatureDependency
A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of field variable dependencies. The default value is 0.

mixedModeBehavior
A SymbolicConstant specifying the mixed mode behavior. Possible values are MODE_INDEPENDENT, TABULAR, POWER_LAW, and BK. The default value is MODE_INDEPENDENT.

modeMixRatio
A SymbolicConstant specifying the mode mix ratio. Possible values are ENERGY and TRACTION. The default value is ENERGY.

power
`None` or a Float specifying the exponent in the power law or the Benzeggagh-Kenane criterion that defines the variation of fracture energy with mode mix for cohesive elements. The default value is `None`.

softening
A SymbolicConstant specifying the softening. Possible values are LINEAR, EXPONENTIAL, and TABULAR. The default value is LINEAR.

Table data

If *type*=DISPLACEMENT, and *softening*=LINEAR, and *mixedModeBehavior*=MODE_INDEPENDENT, the table data specify the following:

- Equivalent total or plastic displacement at failure, measured from the time of damage initiation.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=ENERGY, and *softening*=LINEAR, and *mixedModeBehavior*=MODE_INDEPENDENT, the table data specify the following:

- Fracture energy.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=DISPLACEMENT, and *softening*=LINEAR, and *mixedModeBehavior*=TABULAR, the table data specify the following:

- Total displacement at failure, measured from the time of damage initiation.
- Appropriate mode mix ratio.

- Appropriate mode mix ratio (if relevant, for three-dimensional problems with anisotropic shear behavior).
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=ENERGY, and *softening*=LINEAR, and *mixedModeBehavior*=TABULAR, the table data specify the following:

- Fracture energy.
- Appropriate mode mix ratio.
- Appropriate mode mix ratio (if relevant, for three-dimensional problems with anisotropic shear behavior).
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=DISPLACEMENT, and *softening*=EXPONENTIAL, and *mixedModeBehavior*=MODE_INDEPENDENT, the table data specify the following:

- Equivalent total or plastic displacement at failure, measured from the time of damage initiation.
- Exponential law parameter.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=ENERGY, and *softening*=EXPONENTIAL, and *mixedModeBehavior*=MODE_INDEPENDENT, the table data specify the following:

- Fracture energy.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=DISPLACEMENT, and *softening*=EXPONENTIAL, and *mixedModeBehavior*=TABULAR, the table data specify the following:

- Total displacement at failure, measured from the time of damage initiation.
- Exponential law parameter.
- Appropriate mode mix ratio.
- Appropriate mode mix ratio (if relevant, for three-dimensional problems with anisotropic shear behavior).
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=ENERGY, and *softening*=EXPONENTIAL, and *mixedModeBehavior*=TABULAR, the table data specify the following:

- Fracture energy.
- Appropriate mode mix ratio.
- Appropriate mode mix ratio (if relevant, for three-dimensional problems with anisotropic shear behavior).
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=DISPLACEMENT, and *softening*=TABULAR, and *mixedModeBehavior*=MODE_INDEPENDENT, the table data specify the following:

- Damage variable.
- Equivalent total or plastic displacement, measured from the time of damage initiation.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=DISPLACEMENT, and *softening*=TABULAR, and *mixedModeBehavior*=TABULAR, the table data specify the following:

- Damage variable.
- Equivalent total or plastic displacement, measured from the time of damage initiation.
- Appropriate mode mix ratio.
- Appropriate mode mix ratio (if relevant, for three-dimensional problems with anisotropic shear behavior).
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=ENERGY, and *softening*=LINEAR or EXPONENTIAL, and *mixedModeBehavior*=POWER_LAW or BK, the table data specify the following:

- Normal mode fracture energy.
- Shear mode fracture energy for failure in the first shear direction.
- Shear mode fracture energy for failure in the second shear direction.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=ENERGY, *softening*=LINEAR and constructor for *DamageInitiation*=HashinDamageInitiation the table data specify the following:

- Fiber tensile fracture energy.
- Fiber compressive fracture energy.
- Matrix tensile fracture energy.
- Matrix compressive fracture energy.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A DamageEvolution object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the DamageEvolution object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *DamageEvolution* method.

Return value

`None.`

Exceptions

RangeError.

Members

The DamageEvolution object has members with the same names and descriptions as the arguments to the *DamageEvolution* method.

Corresponding analysis keywords

- **DAMAGE EVOLUTION*

DamageInitiation object

The DamageInitiation object specifies material properties to define the initiation of damage.

DuctileDamageInitiation(...)

This method creates a DamageInitiation object.

Path

```
mdb.models[name].materials[name].DuctileDamageInitiation
session.odbs[name].materials[name].DuctileDamageInitiation
```

Required arguments

table A sequence of sequences of Floats specifying the items described in the "Table data" section.

Optional arguments

definition A SymbolicConstant specifying the damage initiation definition. Possible values are FLD and MSFLD. The default value is MSFLD.

feq A Float specifying the critical value of the deformation severity index for equivalent plastic strains. The default value is 10.0.

fnn A Float specifying the critical value of the deformation severity index for strains normal to the groove direction. The default value is 10.0.

fnt A Float specifying the critical value of the deformation severity index for shear strains. The default value is 10.0.

frequency An Int specifying the frequency, in increments, at which the Marciniak-Kuczynski analysis is going to be performed. The default value is 1.

ks A Float specifying the value of Ks. The default value is 0.0.

numberImperfections An Int specifying the number of imperfections to be considered for the evaluation of the Marciniak-Kuczynski analysis. These imperfections are assumed to be equally spaced in the angular direction. The default value is 4.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

alpha A Float specifying the value of the coefficient that will multiply the shear contribution to the Hashin's fiber initiation criterion. The default value is 0.0.

omega A Float specifying the factor used for filtering the ratio of principal strain rates used for the evaluation of the MSFLD damage initiation criterion. The default value is 1.0.

tolerance A Float specifying the tolerance within which the damage initiation criterion must be satisfied. The default value is 0.05.

lodeDependency A Boolean specifying whether the data depend on lode dependent data. The default value is OFF.

accumulationPower A Float specifying the value of the power coefficient, *N*. The default value is 0.0.

direction A SymbolicConstant specifying the damage initiation direction. Possible values are NMORI and TMORI. The default value is NMORI.

Table data

If the constructor is DuctileDamageInitiation, the table data specify the following:

- Equivalent fracture strain at damage initiation.
- Stress triaxiality.

- Lode-dependent, if the data depend on lode angle.
- Strain rate.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If the constructor is FldDamageInitiation, the table data specify the following:

- Major principal strain at damage initiation.
- Minor principal strain.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If constructor FlsdDamageInitiation, the table data specify the following:

- Major principal stress at damage initiation.
- Minor principal stress.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If the constructor is JohnsonCookDamageInitiation, the table data specify the following:

- Johnson-Cook failure parameter D1.
- Johnson-Cook failure parameter D2.
- Johnson-Cook failure parameter D3.
- Johnson-Cook failure parameter D4.
- Johnson-Cook failure parameter D5.
- Melting temperature.
- Transition temperature.
- Reference strain rate.

If the constructor is MkDamageInitiation, the table data specify the following:

- Flaw size relative to the nominal thickness of the section.
- Angle (in degrees) with respect to the 1-direction of the local material orientation.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If the constructor is MsfldDamageInitiation and *definition*=MSFLD, the table data specify the following:

- Nominal strain at damage initiation in a normal-only mode.
- Equivalent plastic strain at initiation of localized necking.
- Ratio of minor to major principal strains.
- Equivalent plastic strain rate.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If the constructor is MsfldDamageInitiation and *definition*=FLD, the table data specify the following:

- Major principal strain at initiation of localized necking.
- Equivalent plastic strain at initiation of localized necking.
- Ratio of minor to major principal strains.
- Equivalent plastic strain rate.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If the constructor is QuadeDamageInitiation or MaxeDamageInitiation, the table data specify the following:

- Nominal strain at damage initiation in a normal-only mode.
- Nominal strain at damage initiation in a shear-only mode that involves separation only along the first shear direction.
- Nominal strain at damage initiation in a shear-only mode that involves separation only along the second shear direction.
- Rate-dependent, if the data depend on the effective rate of separation.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If the constructor is QuadsDamageInitiation or MaxsDamageInitiation, the table data specify the following:

- Nominal strain at damage initiation in a normal-only mode.
- Nominal strain at damage initiation in a shear-only mode that involves separation only along the first shear direction.
- Nominal strain at damage initiation in a shear-only mode that involves separation only along the second shear direction.
- Rate-dependent, if the data depend on the effective rate of separation.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If the constructor is MaxpeDamageInitiation, the table data specify the following:

- Maximum principal strain at damage initiation.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If the constructor is MaxpsDamageInitiation, the table data specify the following:

- Maximum principal stress at damage initiation.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If the constructor is ShearDamageInitiation, the table data specify the following:

- Equivalent fracture strain at damage initiation.
- Shear stress ratio.
- Strain rate.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If the constructor is HosfordCoulombDamageInitiation, the table data specify the following:

- a.
- b.
- c.
- n.
- d.
- reference strain rate.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If the constructor is HashinDamageInitiation, the table data specify the following:

- Fiber tensile strength.
- Fiber compressive strength.
- Matrix tensile strength.
- Matrix compressive strength.
- Longitudinal shear strength.
- Transverse shear strength.

- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.
- If the constructor is LaRC05DamageInitiation, the table data specify the following:
  - Longitudinal tensile strength.
  - Longitudinal compressive strength.
  - Transverse tensile strength.
  - Transverse compressive strength.
  - In Plane shear strength.
  - Fracture plane angle for pure compression.
  - Misalignment angle at failure for pure compression
  - Transverse shear strength.
  - Longitudinal shear friction coefficient.
  - Transverse shear friction coefficient.
  - Temperature, if the data depend on temperature.
  - Value of the first field variable, if the data depend on field variables.
  - Value of the second field variable.
  - Etc.

Return value

A DamageInitiation object.

Exceptions

RangeError.

FldDamageInitiation(...)

This method creates a DamageInitiation object.

Path

```
mdb.models[name].materials[name].FldDamageInitiation
session.odbs[name].materials[name].FldDamageInitiation
```

Required arguments

table A sequence of sequences of Floats specifying the items described in the "Table data" section.

Optional arguments

definition A SymbolicConstant specifying the damage initiation definition. Possible values are FLD and MSFLD. The default value is MSFLD.

feq A Float specifying the critical value of the deformation severity index for equivalent plastic strains. The default value is 10.0.

fnn A Float specifying the critical value of the deformation severity index for strains normal to the groove direction. The default value is 10.0.

fnt A Float specifying the critical value of the deformation severity index for shear strains. The default value is 10.0.

frequency An Int specifying the frequency, in increments, at which the Marciniak-Kuczynski analysis is going to be performed. The default value is 1.

ks A Float specifying the value of Ks. The default value is 0.0.

numberImperfections An Int specifying the number of imperfections to be considered for the evaluation of the Marciniak-Kuczynski analysis. These imperfections are assumed to be equally spaced in the angular direction. The default value is 4.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

alpha A Float specifying the value of the coefficient that will multiply the shear contribution to the Hashin's fiber initiation criterion. The default value is 0.0.

omega A Float specifying the factor used for filtering the ratio of principal strain rates used for the evaluation of the MSFLD damage initiation criterion. The default value is 1.0.

tolerance A Float specifying the tolerance within which the damage initiation criterion must be satisfied. The default value is 0.05.

direction A SymbolicConstant specifying the damage initiation direction. Possible values are NMORI and TMORI. The default value is NMORI.

Return value

A DamageInitiation object.

Exceptions

RangeError.

FlsdDamageInitiation(...)

This method creates a DamageInitiation object.

Path

```
mdb.models[name].materials[name].FlsdDamageInitiation
session.odbs[name].materials[name].FlsdDamageInitiation
```

Required arguments

table A sequence of sequences of Floats specifying the items described in the "Table data" section.

Optional arguments

definition A SymbolicConstant specifying the damage initiation definition. Possible values are FLD and MSFLD. The default value is MSFLD.

feq A Float specifying the critical value of the deformation severity index for equivalent plastic strains. The default value is 10.0.

fnn A Float specifying the critical value of the deformation severity index for strains normal to the groove direction. The default value is 10.0.

fnt A Float specifying the critical value of the deformation severity index for shear strains. The default value is 10.0.

frequency An Int specifying the frequency, in increments, at which the Marciniak-Kuczynski analysis is going to be performed. The default value is 1.

ks A Float specifying the value of Ks. The default value is 0.0.

numberImperfections An Int specifying the number of imperfections to be considered for the evaluation of the Marciniak-Kuczynski analysis. These imperfections are assumed to be equally spaced in the angular direction. The default value is 4.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

alpha A Float specifying the value of the coefficient that will multiply the shear contribution to the Hashin's fiber initiation criterion. The default value is 0.0.

omega A Float specifying the factor used for filtering the ratio of principal strain rates used for the evaluation of the MSFLD damage initiation criterion. The default value is 1.0.

tolerance A Float specifying the tolerance within which the damage initiation criterion must be satisfied. The default value is 0.05.

direction A SymbolicConstant specifying the damage initiation direction. Possible values are NMORI and TMORI. The default value is NMORI.

Return value

A DamageInitiation object.

Exceptions

RangeError.

JohnsonCookDamageInitiation(...)

This method creates a DamageInitiation object.

Path

```
mdb.models[name].materials[name].JohnsonCookDamageInitiation
session.odbs[name].materials[name].JohnsonCookDamageInitiation
```

Required arguments

table A sequence of sequences of Floats specifying the items described in the "Table data" section.

Optional arguments

definition A SymbolicConstant specifying the damage initiation definition. Possible values are FLD and MSFLD. The default value is MSFLD.

feq A Float specifying the critical value of the deformation severity index for equivalent plastic strains. The default value is 10.0.

fnn A Float specifying the critical value of the deformation severity index for strains normal to the groove direction. The default value is 10.0.

fnt A Float specifying the critical value of the deformation severity index for shear strains. The default value is 10.0.

frequency An Int specifying the frequency, in increments, at which the Marciniak-Kuczynski analysis is going to be performed. The default value is 1.

ks A Float specifying the value of Ks. The default value is 0.0.

numberImperfections An Int specifying the number of imperfections to be considered for the evaluation of the Marciniak-Kuczynski analysis. These imperfections are assumed to be equally spaced in the angular direction. The default value is 4.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

alpha A Float specifying the value of the coefficient that will multiply the shear contribution to the Hashin's fiber initiation criterion. The default value is 0.0.

omega A Float specifying the factor used for filtering the ratio of principal strain rates used for the evaluation of the MSFLD damage initiation criterion. The default value is 1.0.

tolerance A Float specifying the tolerance within which the damage initiation criterion must be satisfied. The default value is 0.05.

accumulationPower A Float specifying the value of the power coefficient, N. The default value is 0.0.

direction A SymbolicConstant specifying the damage initiation direction. Possible values are NMORI and TMORI. The default value is NMORI.

Return value

A DamageInitiation object.

Exceptions

RangeError.

MaxeDamageInitiation(...)

This method creates a DamageInitiation object.

Path

```
mdb.models[name].materials[name].MaxeDamageInitiation
session.odbs[name].materials[name].MaxeDamageInitiation
```

Required arguments

table A sequence of sequences of Floats specifying the items described in the "Table data" section.

Optional arguments

definition A SymbolicConstant specifying the damage initiation definition. Possible values are FLD and MSFLD. The default value is MSFLD.

feq A Float specifying the critical value of the deformation severity index for equivalent plastic strains. The default value is 10.0.

fnn A Float specifying the critical value of the deformation severity index for strains normal to the groove direction. The default value is 10.0.

fnt A Float specifying the critical value of the deformation severity index for shear strains. The default value is 10.0.

frequency An Int specifying the frequency, in increments, at which the Marciniak-Kuczynski analysis is going to be performed. The default value is 1.

ks A Float specifying the value of Ks. The default value is 0.0.

numberImperfections An Int specifying the number of imperfections to be considered for the evaluation of the Marciniak-Kuczynski analysis. These imperfections are assumed to be equally spaced in the angular direction. The default value is 4.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

alpha A Float specifying the value of the coefficient that will multiply the shear contribution to the Hashin's fiber initiation criterion. The default value is 0.0.

omega A Float specifying the factor used for filtering the ratio of principal strain rates used for the evaluation of the MSFLD damage initiation criterion. The default value is 1.0.

tolerance A Float specifying the tolerance within which the damage initiation criterion must be satisfied. The default value is 0.05.

growthTolerance A Float specifying a separate tolerance used for crack growth within which the damage initiation criterion must be satisfied. The default value is equal to tolerance.

unstableGrowthTolerance A Float specifying a separate tolerance used for unstable crack growth within which the damage initiation criterion must be satisfied. The default value is infinity.

rateDependency A Boolean specifying whether the data depend on the effective rate of separation. The default value is OFF.

direction A SymbolicConstant specifying the damage initiation direction. Possible values are NMORI and TMORI. The default value is NMORI.

position An SymbolicConstant specifying the damage initiation position. Possible values are CENTROID, CRACKTIP, and COMBINED. The default value is CENTROID.

Return value

A DamageInitiation object.

Exceptions

RangeError.

MaxsDamageInitiation(...)

This method creates a DamageInitiation object.

Path

```
mdb.models[name].materials[name].MaxsDamageInitiation
session.odbs[name].materials[name].MaxsDamageInitiation
```

Required arguments

table
A sequence of sequences of Floats specifying the items described in the "Table data" section.

Optional arguments

definition
A SymbolicConstant specifying the damage initiation definition. Possible values are FLD and MSFLD. The default value is MSFLD.

feq
A Float specifying the critical value of the deformation severity index for equivalent plastic strains. The default value is 10.0.

fnn
A Float specifying the critical value of the deformation severity index for strains normal to the groove direction. The default value is 10.0.

fnt
A Float specifying the critical value of the deformation severity index for shear strains. The default value is 10.0.

frequency
An Int specifying the frequency, in increments, at which the Marciniak-Kuczynski analysis is going to be performed. The default value is 1.

ks
A Float specifying the value of Ks. The default value is 0.0.

numberImperfections
An Int specifying the number of imperfections to be considered for the evaluation of the Marciniak-Kuczynski analysis. These imperfections are assumed to be equally spaced in the angular direction. The default value is 4.

temperatureDependency
A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of field variable dependencies. The default value is 0.

alpha
A Float specifying the value of the coefficient that will multiply the shear contribution to the Hashin's fiber initiation criterion. The default value is 0.0.

omega
A Float specifying the factor used for filtering the ratio of principal strain rates used for the evaluation of the MSFLD damage initiation criterion. The default value is 1.0.

tolerance
A Float specifying the tolerance within which the damage initiation criterion must be satisfied. The default value is 0.05.

growthTolerance
A Float specifying a separate tolerance used for crack growth within which the damage initiation criterion must be satisfied. The default value is equal to tolerance.

unstableGrowthTolerance
A Float specifying a separate tolerance used for unstable crack growth within which the damage initiation criterion must be satisfied. The default value is infinity.

rateDependency
A Boolean specifying whether the data depend on the effective rate of separation. The default value is OFF.

direction A SymbolicConstant specifying the damage initiation direction. Possible values are NMORI and TMORI. The default value is NMORI.

position An SymbolicConstant specifying the damage initiation position. Possible values are CENTROID, CRACKTIP, and COMBINED. The default value is CENTROID.

Return value

A DamageInitiation object.

Exceptions

RangeError.

MkDamageInitiation(...)

This method creates a DamageInitiation object.

Path

```
mdb.models[name].materials[name].MkDamageInitiation
session.odbs[name].materials[name].MkDamageInitiation
```

Required arguments

table A sequence of sequences of Floats specifying the items described in the "Table data" section.

Optional arguments

definition A SymbolicConstant specifying the damage initiation definition. Possible values are FLD and MSFLD. The default value is MSFLD.

feq A Float specifying the critical value of the deformation severity index for equivalent plastic strains. The default value is 10.0.

fnn A Float specifying the critical value of the deformation severity index for strains normal to the groove direction. The default value is 10.0.

fnt A Float specifying the critical value of the deformation severity index for shear strains. The default value is 10.0.

frequency An Int specifying the frequency, in increments, at which the Marciniak-Kuczynski analysis is going to be performed. The default value is 1.

ks A Float specifying the value of Ks. The default value is 0.0.

numberImperfections An Int specifying the number of imperfections to be considered for the evaluation of the Marciniak-Kuczynski analysis. These imperfections are assumed to be equally spaced in the angular direction. The default value is 4.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

alpha A Float specifying the value of the coefficient that will multiply the shear contribution to the Hashin's fiber initiation criterion. The default value is 0.0.

omega A Float specifying the factor used for filtering the ratio of principal strain rates used for the evaluation of the MSFLD damage initiation criterion. The default value is 1.0.

tolerance A Float specifying the tolerance within which the damage initiation criterion must be satisfied. The default value is 0.05.

direction A SymbolicConstant specifying the damage initiation direction. Possible values are NMORI and TMORI. The default value is NMORI.

Return value

A DamageInitiation object.

Exceptions

RangeError.

MsfldDamageInitiation(...)

This method creates a DamageInitiation object.

Path

```
mdb.models[name].materials[name].MsfldDamageInitiation
session.odbs[name].materials[name].MsfldDamageInitiation

Required arguments

table
A sequence of sequences of Floats specifying the items described in the "Table data" section.

Optional arguments

definition
A SymbolicConstant specifying the damage initiation definition. Possible values are FLD and MSFLD. The default value is MSFLD.

feq
A Float specifying the critical value of the deformation severity index for equivalent plastic strains. The default value is 10.0.

fnn
A Float specifying the critical value of the deformation severity index for strains normal to the groove direction. The default value is 10.0.

fnt
A Float specifying the critical value of the deformation severity index for shear strains. The default value is 10.0.

frequency
An Int specifying the frequency, in increments, at which the Marciniak-Kuczynski analysis is going to be performed. The default value is 1.

ks
A Float specifying the value of Ks. The default value is 0.0.

numberImperfections
An Int specifying the number of imperfections to be considered for the evaluation of the Marciniak-Kuczynski analysis. These imperfections are assumed to be equally spaced in the angular direction. The default value is 4.

temperatureDependency
A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of field variable dependencies. The default value is 0.

alpha
A Float specifying the value of the coefficient that will multiply the shear contribution to the Hashin's fiber initiation criterion. The default value is 0.0.

omega
A Float specifying the factor used for filtering the ratio of principal strain rates used for the evaluation of the MSFLD damage initiation criterion. The default value is 1.0.

tolerance
A Float specifying the tolerance within which the damage initiation criterion must be satisfied. The default value is 0.05.

growthTolerance
A Float specifying a separate tolerance used for crack growth within which the damage initiation criterion must be satisfied. The default value is equal to tolerance.

unstableGrowthTolerance
A Float specifying a separate tolerance used for unstable crack growth within which the damage initiation criterion must be satisfied. The default value is infinity.

rateDependency
A Boolean specifying whether the data depend on the effective rate of separation. The default value is OFF.

direction A SymbolicConstant specifying the damage initiation direction. Possible values are NMORI and TMORI. The default value is NMORI.

position An SymbolicConstant specifying the damage initiation position. Possible values are CENTROID, CRACKTIP, and COMBINED. The default value is CENTROID.

Return value

A DamageInitiation object.

Exceptions

RangeError.

QuadsDamageInitiation(...)

This method creates a DamageInitiation object.

```

Required arguments

table A sequence of sequences of Floats specifying the items described in the "Table data" section.

Optional arguments

definition A SymbolicConstant specifying the damage initiation definition. Possible values are FLD and MSFLD. The default value is MSFLD.

feq A Float specifying the critical value of the deformation severity index for equivalent plastic strains. The default value is 10.0.

fnn A Float specifying the critical value of the deformation severity index for strains normal to the groove direction. The default value is 10.0.

fnt A Float specifying the critical value of the deformation severity index for shear strains. The default value is 10.0.

frequency An Int specifying the frequency, in increments, at which the Marciniak-Kuczynski analysis is going to be performed. The default value is 1.

ks A Float specifying the value of Ks. The default value is 0.0.

numberImperfections An Int specifying the number of imperfections to be considered for the evaluation of the Marciniak-Kuczynski analysis. These imperfections are assumed to be equally spaced in the angular direction. The default value is 4.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

alpha A Float specifying the value of the coefficient that will multiply the shear contribution to the Hashin's fiber initiation criterion. The default value is 0.0.

omega A Float specifying the factor used for filtering the ratio of principal strain rates used for the evaluation of the MSFLD damage initiation criterion. The default value is 1.0.

tolerance A Float specifying the tolerance within which the damage initiation criterion must be satisfied. The default value is 0.05.

direction A SymbolicConstant specifying the damage initiation direction. Possible values are NMORI and TMORI. The default value is NMORI.

position An SymbolicConstant specifying the damage initiation position. Possible values are CENTROID, CRACKTIP, COMBINED, and NONLOCAL. The default value is CENTROID.

growthTolerance A Float specifying a separate tolerance used for crack growth within which the damage initiation criterion must be satisfied. The default value is equal to tolerance.

unstableGrowthTolerance A Float specifying a separate tolerance used for unstable crack growth within which the damage initiation criterion must be satisfied. The default value is infinity.

anglemax
A Float specifying the maximum allowed change in the crack propagation angle (in degrees) between the new crack propagation direction and the previous crack propagation direction. The default value is 85.0.

angSmooth
A Float specifying the maximum allowed difference (in degrees) below which the normals of the crack facets are included in the moving least-squares approximation to smooth out the crack normals to obtain the crack propagation direction along the crack front. The default value is 70.0.

rCrackDirection
A Float specifying the radius around the crack tip within which the elements are included for calculating the averaged stress/strain and for smoothing out the normals of the individual crack facets along the crack front used to obtain the crack propagation direction. The default value is 0.0.

iniSmooth
An SymbolicConstant specifying the damage initiation inismooth. Possible values are YES and NO. The default value is YES.

smoothing
An SymbolicConstant specifying the damage initiation smoothing. Possible values are NONE and NODAL. The default value is NONE.

npoly
An SymbolicConstant specifying the number of terms in the polynomial used for the moving least-squares approximation to smooth out the crack normals. Possible values are QUADRATIC, LEAST-SQUARE, LINEAR, and CUBIC. The default value is QUADRATIC.

weightingMethod
An SymbolicConstant specifying the damage initiation weighting method. Possible values are UNIFORM, GAUSS, CUBIC, and USER. The default value is UNIFORM.

Return value

A DamageInitiation object.

Exceptions

RangeError.

MaxpsDamageInitiation(...)

This method creates a DamageInitiation object.

alpha A Float specifying the value of the coefficient that will multiply the shear contribution to the Hashin's fiber initiation criterion. The default value is 0.0.

omega A Float specifying the factor used for filtering the ratio of principal strain rates used for the evaluation of the MSFLD damage initiation criterion. The default value is 1.0.

tolerance A Float specifying the tolerance within which the damage initiation criterion must be satisfied. The default value is 0.05.

accumulationPower A Float specifying the value of the power coefficient, N. The default value is 0.0.

direction A SymbolicConstant specifying the damage initiation direction. Possible values are NMORI and TMORI. The default value is NMORI.

Return value

A DamageInitiation object.

Exceptions

RangeError.

HashinDamageInitiation(...)

This method creates a DamageInitiation object.

Path

```
mdb.models[name].materials[name].HashinDamageInitiation
session.odbs[name].materials[name].HashinDamageInitiation
```

Required arguments

table A sequence of sequences of Floats specifying the items described in the "Table data" section.

Optional arguments

definition A SymbolicConstant specifying the damage initiation definition. Possible values are FLD and MSFLD. The default value is MSFLD.

feq A Float specifying the critical value of the deformation severity index for equivalent plastic strains. The default value is 10.0.

fnn A Float specifying the critical value of the deformation severity index for strains normal to the groove direction. The default value is 10.0.

fnt A Float specifying the critical value of the deformation severity index for shear strains. The default value is 10.0.

frequency An Int specifying the frequency, in increments, at which the Marciniak-Kuczynski analysis is going to be performed. The default value is 1.

ks A Float specifying the value of Ks. The default value is 0.0.

numberImperfections An Int specifying the number of imperfections to be considered for the evaluation of the Marciniak-Kuczynski analysis. These imperfections are assumed to be equally spaced in the angular direction. The default value is 4.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

alpha A Float specifying the value of the coefficient that will multiply the shear contribution to the Hashin's fiber initiation criterion. The default value is 0.0.

omega A Float specifying the factor used for filtering the ratio of principal strain rates used for the evaluation of the MSFLD damage initiation criterion. The default value is 1.0.

tolerance A Float specifying the tolerance within which the damage initiation criterion must be satisfied. The default value is 0.05.

direction A SymbolicConstant specifying the damage initiation direction. Possible values are NMORI and TMORI. The default value is NMORI.

Return value

A DamageInitiation object.

Exceptions

RangeError.

LaRC05DamageInitiation(...)

This method creates a DamageInitiation object.

Path

```
mdb.models[name].materials[name].LaRC05DamageInitiation
session.odbs[name].materials[name].LaRC05DamageInitiation
```

Required arguments

table A sequence of sequences of Floats specifying the items described in the "Table data" section.

Optional arguments

definition A SymbolicConstant specifying the damage initiation definition. Possible values are FLD and MSFLD. The default value is MSFLD.

feq A Float specifying the critical value of the deformation severity index for equivalent plastic strains. The default value is 10.0.

fnn A Float specifying the critical value of the deformation severity index for strains normal to the groove direction. The default value is 10.0.

fnt A Float specifying the critical value of the deformation severity index for shear strains. The default value is 10.0.

frequency An Int specifying the frequency, in increments, at which the Marciniak-Kuczynski analysis is going to be performed. The default value is 1.

ks A Float specifying the value of Ks. The default value is 0.0.

numberImperfections An Int specifying the number of imperfections to be considered for the evaluation of the Marciniak-Kuczynski analysis. These imperfections are assumed to be equally spaced in the angular direction. The default value is 4.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

alpha A Float specifying the value of the coefficient that will multiply the shear contribution to the Hashin's fiber initiation criterion. The default value is 0.0.

omega A Float specifying the factor used for filtering the ratio of principal strain rates used for the evaluation of the MSFLD damage initiation criterion. The default value is 1.0.

tolerance A Float specifying the tolerance within which the damage initiation criterion must be satisfied. The default value is 0.05.

direction A SymbolicConstant specifying the damage initiation direction. Possible values are NMORI and TMORI. The default value is NMORI.

Return value

A DamageInitiation object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the DamageInitiation object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *DamageInitiation* method.

Return value

`None.`

Exceptions

None.

Members

The DamageInitiation object can have the following members:

definition
A SymbolicConstant specifying the damage initiation definition. Possible values are FLD and MSFLD. The default value is MSFLD.

feq
A Float specifying the critical value of the deformation severity index for equivalent plastic strains. The default value is 10.0.

fnn
A Float specifying the critical value of the deformation severity index for strains normal to the groove direction. The default value is 10.0.

fnt
A Float specifying the critical value of the deformation severity index for shear strains. The default value is 10.0.

frequency
An Int specifying the frequency, in increments, at which the Marciniak-Kuczynski analysis is going to be performed. The default value is 1.

ks
A Float specifying the value of Ks. The default value is 0.0.

numberImperfections
An Int specifying the number of imperfections to be considered for the evaluation of the Marciniak-Kuczynski analysis. These imperfections are assumed to be equally spaced in the angular direction. The default value is 4.

temperatureDependency
A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of field variable dependencies. The default value is 0.

alpha
A Float specifying the value of the coefficient that will multiply the shear contribution to the Hashin's fiber initiation criterion. The default value is 0.0.

omega
A Float specifying the factor used for filtering the ratio of principal strain rates used for the evaluation of the MSFLD damage initiation criterion. The default value is 1.0.

tolerance
A Float specifying the tolerance within which the damage initiation criterion must be satisfied. The default value is 0.05.

direction
A SymbolicConstant specifying the damage initiation direction. Possible values are NMORI and TMORI. The default value is NMORI.

position
An SymbolicConstant specifying the damage initiation position. Possible values are CENTROID, CRACKTIP, COMBINED, and NONLOCAL. The default value is CENTROID.

growthTolerance
A Float specifying a separate tolerance used for crack growth within which the damage initiation criterion must be satisfied. The default value is equal to tolerance.

unstableGrowthTolerance
A Float specifying a separate tolerance used for unstable crack growth within which the damage initiation criterion must be satisfied. The default value is infinity.

anglemax
A Float specifying the maximum allowed change in the crack propagation angle (in degrees) between the new crack propagation direction and the previous crack propagation direction. The default value is 85.0.

angSmooth
A Float specifying the maximum allowed difference (in degrees) below which the normals of the crack facets are included in the moving least-squares approximation to smooth out the crack normals to obtain the crack propagation direction along the crack front. The default value is 70.0.

rCrackDirection
A Float specifying the radius around the crack tip within which the elements are included for calculating the averaged stress/strain and for smoothing out the normals of the individual crack facets along the crack front used to obtain the crack propagation direction. The default value is 0.0.

iniSmooth
An SymbolicConstant specifying the damage initiation inismooth. Possible values are YES and NO. The default value is YES.

smoothing
An SymbolicConstant specifying the damage initiation smoothing. Possible values are NONE and NODAL. The default value is NONE.

npoly
An SymbolicConstant specifying the number of terms in the polynomial used for the moving least-squares approximation to smooth out the crack normals. Possible values are QUADRATIC, LEAST-SQUARE, LINEAR, and CUBIC. The default value is QUADRATIC.

weightingMethod
An SymbolicConstant specifying the damage initiation weighting method. Possible values are UNIFORM, GAUSS, CUBIC, and USER. The default value is UNIFORM.

table
A tuple of tuples of Floats specifying the items described in the "Table data" section.

damageEvolution
A *DamageEvolution* object.

damageStabilization
A *DamageStabilization* object.

damageStabilizationCohesive
A *DamageStabilizationCohesive* object.

Corresponding analysis keywords

- **DAMAGE INITIATION*

DamageStabilization object

The DamageStabilization object specifies the viscosity coefficients for the damage model for fiber-reinforced materials.

Required arguments

fiberTensileCoeff A Float specifying the viscosity coefficient for the fiber tensile failure mode.

fiberCompressiveCoeff A Float specifying the viscosity coefficient for the fiber compressive failure mode.

matrixTensileCoeff A Float specifying the viscosity coefficient for the matrix tensile failure mode.

matrixCompressiveCoeff A Float specifying the viscosity coefficient for the matrix compressive failure mode.

Optional arguments

None.

Return value

A DamageStabilization object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the DamageStabilization object.

Required arguments

Required arguments

None.

Optional arguments

cohesiveCoeff `None` or a Float specifying the viscosity coefficient. The default value is `None`.

Return value

A DamageStabilizationCohesive object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the DamageStabilizationCohesive object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *DamageStabilizationCohesive* method.

Return value

`None.`

Exceptions

RangeError.

Members

The DamageStabilizationCohesive object has members with the same names and descriptions as the arguments to the *DamageStabilizationCohesive* method.

Damping object

The Damping object specifies material damping.

Access

```
import material
mdb.models[name].materials[name].damping
import odbMaterial
session.odbs[name].materials[name].damping
```

Damping(...)

This method creates a Damping object.

Path

```
mdb.models[name].materials[name].Damping
session.odbs[name].materials[name].Damping
```

Required arguments

None.

Optional arguments

alpha

A Float specifying the α_R factor to create mass proportional damping in direct-integration and explicit dynamics. The default value is 0.0.

beta

A Float specifying the β_R factor to create stiffness proportional damping in direct-integration and explicit dynamics. The default value is 0.0.

composite

A Float specifying the fraction of critical damping to be used with this material in calculating composite damping factors for the modes (for use in modal dynamics). The default value is 0.0.

This argument applies only to Abaqus/Standard analyses.

structural

A Float specifying the structural factor to create material damping in direct-integration and explicit dynamics. The default value is 0.0.

Return value

A Damping object.

Exceptions

RangeError.

setValues(...)

This method modifies the Damping object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Damping* method.

Return value

`None.`

Exceptions

RangeError.

Members

The Damping object has members with the same names and descriptions as the arguments to the *Damping* method.

DeformationPlasticity object

The DeformationPlasticity object specifies the deformation plasticity model.

Access

```
import material
mdb.models[name].materials[name].deformationPlasticity
import odbMaterial
session.odbs[name].materials[name].deformationPlasticity
```

DeformationPlasticity(...)

This method creates a DeformationPlasticity object.

Path

```
mdb.models[name].materials[name].DeformationPlasticity
session.odbs[name].materials[name].DeformationPlasticity
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

Table data

- Young's modulus, E.
- Poisson's ratio, ν.
- Yield stress, σ^0.
- Exponent, n.
- Yield offset, α.
- Temperature, if the data depend on temperature.

Return value

A DeformationPlasticity object.

Exceptions

RangeError.

setValues(...)

This method modifies the DeformationPlasticity object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *DeformationPlasticity* method.

Return value

`None.`

Exceptions

RangeError.

Members

The DeformationPlasticity object has members with the same names and descriptions as the arguments to the *DeformationPlasticity* method.

Corresponding analysis keywords

- **DEFORMATION PLASTICITY*

Density object

The Density object specifies the material density.

Access

```
import material
mdb.models[name].materials[name].density
import odbMaterial
session.odbs[name].materials[name].density
```

Density(...)

This method creates a Density object.

Path

```
mdb.models[name].materials[name].Density
session.odbs[name].materials[name].Density
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

distributionType A SymbolicConstant specifying how the density is distributed spatially. Possible values are UNIFORM, ANALYTICAL_FIELD, and DISCRETE_FIELD. The default value is UNIFORM.

fieldName A String specifying the name of the *AnalyticalField* or *DiscreteField* object associated with this material option. The *fieldName* argument applies only when *distributionType*=ANALYTICAL_FIELD or *distributionType*=DISCRETE_FIELD. The default value is an empty string.

Table data

- The mass density.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A Density object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the Density object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Density* method.

Return value

`None.`

Exceptions

RangeError.

Members

The Density object has members with the same names and descriptions as the arguments to the *Density* method.

Corresponding analysis keywords

Depvar object

The Depvar object specifies solution-dependent state variables.

Access

```
import material
mdb.models[name].materials[name].depvar
import odbMaterial
session.odbs[name].materials[name].depvar
```

Depvar(...)

This method creates a Depvar object.

Path

```
mdb.models[name].materials[name].Depvar
session.odbs[name].materials[name].Depvar
```

Required arguments

None.

Optional arguments

deleteVar An Int specifying the state variable number controlling the element deletion flag. The default value is 0.

This argument applies only to Abaqus/Explicit analyses.

n An Int specifying the number of solution-dependent state variables required at each integration point. The default value is 0.

Return value

A Depvar object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the Depvar object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Depvar* method.

Return value

```
None.
```

Exceptions

RangeError.

Members

The Depvar object has members with the same names and descriptions as the arguments to the *Depvar* method.

Corresponding analysis keywords

- **DEPVAR*

DetonationPoint object

A DetonationPoint object specifies a suboption of the Eos object. The DetonationPoint object defines either isotropic linear elastic shear or linear viscous shear behavior for a hydrodynamic material.

Access

```
import material
mdb.models[name].materials[name].eos.detonationPoint
import odbMaterial
session.odbs[name].materials[name].eos.detonationPoint
```

DetonationPoint(...)

This method creates a DetonationPoint object.

Path

```
mdb.models[name].materials[name].eos.DetonationPoint
session.odbs[name].materials[name].eos.DetonationPoint
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

None.

Table data

- X value for coordinate of detonation point.
- Y value for coordinate of detonation point.
- Z value for coordinate of detonation point.
- Detonation delay time.

Return value

A DetonationPoint object.

Exceptions

None.

setValues(...)

This method modifies the DetonationPoint object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *DetonationPoint* method.

Return value

`None.`

Exceptions

None.

Members

The DetonationPoint object has members with the same names and descriptions as the arguments to the *DetonationPoint* method.

Corresponding analysis keywords

- **DETONATION POINT*

Dielectric object

The Dielectric object specifies dielectric material properties.

Access

```
import material
mdb.models[name].materials[name].dielectric
import odbMaterial
session.odbs[name].materials[name].dielectric
```

Dielectric(...)

This method creates a Dielectric object.

Path

```
mdb.models[name].materials[name].Dielectric
session.odbs[name].materials[name].Dielectric
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

type A SymbolicConstant specifying the dielectric behavior. Possible values are ISOTROPIC, ORTHOTROPIC, and ANISOTROPIC. The default value is ISOTROPIC.

frequencyDependency A Boolean specifying whether the data depend on frequency. The default value is OFF.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

If *type*=ISOTROPIC, the table data specify the following:

- Dielectric constant.
- Frequency, if the data depend on frequency.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=ORTHOTROPIC, the table data specify the following:

- D_{11}^{φ}.
- D_{22}^{φ}.
- D_{33}^{φ}.
- Frequency, if the data depend on frequency.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=ANISOTROPIC, the table data specify the following:

- D_{11}^{φ}.
- D_{12}^{φ}.
- D_{22}^{φ}.
- D_{13}^{φ}.
- D_{23}^{φ}.
- D_{33}^{φ}.
- Frequency, if the data depend on frequency.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A Dielectric object.

Exceptions

None.

`setValues(...)`

This method modifies the Dielectric object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Dielectric* method.

Return value

`None.`

Exceptions

None.

Members

The Dielectric object has members with the same names and descriptions as the arguments to the *Dielectric* method.

Corresponding analysis keywords

- **DIELECTRIC*

Diffusivity object

The Diffusivity object specifies mass diffusivity.

Access

```
import material
mdb.models[name].materials[name].diffusivity
import odbMaterial
session.odbs[name].materials[name].diffusivity
```

Diffusivity(...)

This method creates a Diffusivity object.

Path

```
mdb.models[name].materials[name].Diffusivity
session.odbs[name].materials[name].Diffusivity
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

type A SymbolicConstant specifying the type of diffusivity. Possible values are ISOTROPIC, ORTHOTROPIC, and ANISOTROPIC. The default value is ISOTROPIC.

law A SymbolicConstant specifying the diffusion behavior. Possible values are GENERAL and FICK. The default value is GENERAL.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

If *type*=ISOTROPIC, the table data specify the following:

- Diffusivity, D.
- Concentration, c.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=ORTHOTROPIC, the table data specify the following:

- D_{11}.
- D_{22}.
- D_{33}.
- Concentration, c.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=ANISOTROPIC, the table data specify the following:

- D_{11}.
- D_{12}.
- D_{22}.
- D_{13}.
- D_{23}.
- D_{33}.
- Concentration, c.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A Diffusivity object.

Exceptions

RangeError.

setValues(...)

This method modifies the Diffusivity object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Diffusivity* method.

Return value

`None.`

Exceptions

RangeError.

Members

The Diffusivity object has members with the same names and descriptions as the arguments to the *Diffusivity* method. In addition, the Diffusivity object can have the following members:

pressureEffect
A *PressureEffect* object.

soretEffect
A *SoretEffect* object.

Corresponding analysis keywords

- **DIFFUSIVITY*

DruckerPrager object

The DruckerPrager object specifies the extended Drucker-Prager plasticity model.

Access

```
import material
mdb.models[name].materials[name].druckerPrager
import odbMaterial
session.odbs[name].materials[name].druckerPrager
```

DruckerPrager(...)

This method creates a DruckerPrager object.

Path

```
mdb.models[name].materials[name].DruckerPrager
session.odbs[name].materials[name].DruckerPrager
```

Required arguments

table
A sequence of sequences of Floats specifying the items described below.

Optional arguments

shearCriterion
A SymbolicConstant specifying the yield criterion. Possible values are LINEAR, HYPERBOLIC, and EXPONENTIAL. The default value is LINEAR.

This argument applies only to Abaqus/Standard analyses. Only the linear Drucker-Prager model is available in Abaqus/Explicit analyses.

eccentricity
A Float specifying the flow potential eccentricity, ϵ, a small positive number that defines the rate at which the hyperbolic flow potential approaches its asymptote. The default value is 0.1.

This argument applies only to Abaqus/Standard analyses.

testData
A Boolean specifying whether the material constants for the exponent model are to be computed by Abaqus/Standard from triaxial test data at different levels of confining pressure. The default value is OFF.

This argument is valid only if *shearCriterion*=EXPONENTIAL.

temperatureDependency
A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of field variable dependencies. The default value is 0.

Table data

If *shearCriterion*=LINEAR (the only option allowed in an Abaqus/Explicit analysis), the table data specify the following:

- Material angle of friction, β, in the p–t plane. Give the value in degrees.
- K, the ratio of the flow stress in triaxial tension to the flow stress in triaxial compression. $0.778 \leq K \leq 1.0$. If the default value of 0.0 is accepted, a value of 1.0 is assumed.
- Dilation angle, ψ, in the p–t plane. Give the value in degrees.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *shearCriterion*=HYPERBOLIC, the table data specify the following:

- Material angle of friction, β, at high confining pressure in the p–q plane. Give the value in degrees.
- Initial hydrostatic tension strength, $p_t|_0$.
- Dilation angle, ψ, at high confining pressure in the p–q plane. Give the value in degrees.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *shearCriterion*=EXPONENTIAL, the table data specify the following:

- Dilation angle, ψ, at high confining pressure in the p–q plane. Give the value in degrees.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A DruckerPrager object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the DruckerPrager object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *DruckerPrager* method.

Return value

```
None.
```

Exceptions

RangeError.

Members

The DruckerPrager object has members with the same names and descriptions as the arguments to the *DruckerPrager* method.

In addition, the DruckerPrager object can have the following members:

druckerPragerCreep	A *DruckerPragerCreep* object.
druckerPragerHardening	A *DruckerPragerHardening* object.
rateDependent	A *RateDependent* object.
triaxialTestData	A *TriaxialTestData* object.

Corresponding analysis keywords

- **DRUCKER PRAGER*

DruckerPragerCreep object

The DruckerPragerCreep object specifies creep for Drucker-Prager plasticity models.

Access

```
import material
mdb.models[name].materials[name].druckerPrager.druckerPragerCreep
import odbMaterial
session.odbs[name].materials[name].druckerPrager.druckerPragerCreep
```

DruckerPragerCreep(...)

This method creates a DruckerPragerCreep object.

Path

```
mdb.models[name].materials[name].druckerPrager.DruckerPragerCreep
session.odbs[name].materials[name].druckerPrager.DruckerPragerCreep
```

Required arguments

table
A sequence of sequences of Floats specifying the items described below.

Optional arguments

law
A SymbolicConstant specifying the type of data defining the creep law. Possible values are:

- STRAIN, specifying a strain-hardening power law.
- TIME, specifying a time-hardening power law.
- SINGHM, specifying a Singh-Mitchell type law.
- USER, specifying the creep law is input from user subroutine *CREEP*.

The default value is STRAIN.

temperatureDependency
A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of field variable dependencies. The default value is 0.

Table data

If *law*=TIME or *law*=STRAIN, the table data specify the following:

- A. (Units of $F^{-n}L^{2n}T^{-1-m}$.)
- n.
- m.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.

- Value of the second field variable.
- Etc.

If *law*=SINGHM, the table data specify the following:

- A. (Units of T^{-1}.)
- α. (Units of $F^{-1}L^2$.)
- m.
- t_1. (Units of T.)
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A DruckerPragerCreep object.

Exceptions

RangeError.

setValues(...)

This method modifies the DruckerPragerCreep object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *DruckerPragerCreep* method.

Return value

`None.`

Exceptions

RangeError.

Members

The DruckerPragerCreep object has members with the same names and descriptions as the arguments to the *DruckerPragerCreep* method.

Corresponding analysis keywords

- **DRUCKER PRAGER CREEP*

DruckerPragerHardening object

The DruckerPragerHardening object specifies hardening for Drucker-Prager plasticity models.

Access

```
import material
mdb.models[name].materials[name].druckerPrager.druckerPragerHardening
import odbMaterial
session.odbs[name].materials[name].druckerPrager\
.druckerPragerHardening
```

DruckerPragerHardening(...)

This method creates a DruckerPragerHardening object.

Path

```
mdb.models[name].materials[name].druckerPrager.DruckerPragerHardening
session.odbs[name].materials[name].druckerPrager\
.DruckerPragerHardening
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

type A SymbolicConstant specifying the type of data defining the hardening behavior. Possible values are COMPRESSION, TENSION, and SHEAR. The default value is COMPRESSION.

rate A Boolean specifying whether the data depend on rate. The default value is OFF.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- Yield stress.
- Absolute value of the corresponding plastic strain. (The first tabular value entered must always be zero.)
- Equivalent plastic strain rate, $\dot{\bar{\varepsilon}}^{pl}$, for which this hardening curve applies.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A DruckerPragerHardening object.

Exceptions

RangeError.

setValues(...)

This method modifies the DruckerPragerHardening object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *DruckerPragerHardening* method.

Return value

`None.`

Exceptions

RangeError.

Members

The DruckerPragerHardening object has members with the same names and descriptions as the arguments to the *DruckerPragerHardening* method.

Corresponding analysis keywords

- **DRUCKER PRAGER HARDENING*

Elastic object

The Elastic object specifies elastic material properties.

Access

```
import material
mdb.models[name].materials[name].elastic
import odbMaterial
session.odbs[name].materials[name].elastic
```

Elastic(...)

This method creates an Elastic object.

Path

```
mdb.models[name].materials[name].Elastic
session.odbs[name].materials[name].Elastic
```

Required arguments

table
A sequence of sequences of Floats specifying the items described below.

Optional arguments

type
A SymbolicConstant specifying the type of elasticity data provided. Possible values are:

- ISOTROPIC
- ORTHOTROPIC
- ANISOTROPIC
- ENGINEERING_CONSTANTS
- LAMINA
- TRACTION
- COUPLED_TRACTION
- SHORT_FIBER
- SHEAR
- BILAMINA

The default value is ISOTROPIC.

noCompression
A Boolean specifying whether compressive stress is allowed. The default value is OFF.

noTension
A Boolean specifying whether tensile stress is allowed. The default value is OFF.

temperatureDependency
A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of field variable dependencies. The default value is 0.

moduli

A SymbolicConstant specifying the time-dependence of the elastic material constants. Possible values are INSTANTANEOUS and LONG_TERM. The default value is LONG_TERM.

Table data

If *type*=ISOTROPIC, the table data specify the following:

- The Young's modulus, E.
- The Poisson's ratio, ν.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=SHEAR, the table data specify the following:

- The shear modulus,G.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=ENGINEERING_CONSTANTS, the table data specify the following:

- E_1.
- E_2.
- E_3.
- ν_{12}.
- ν_{13}.
- ν_{23}.
- G_{12}.
- G_{13}.
- G_{23}.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=LAMINA, the table data specify the following:

- E_1.
- E_2.

- ν_{12}.
- G_{12}.
- G_{13}. This shear modulus is needed to define transverse shear behavior in shells.
- G_{23}. This shear modulus is needed to define transverse shear behavior in shells.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=ORTHOTROPIC, the table data specify the following:

- D_{1111}.
- D_{1122}.
- D_{2222}.
- D_{1133}.
- D_{2233}.
- D_{3333}.
- D_{1212}.
- D_{1313}.
- D_{2323}.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=ANISOTROPIC, the table data specify the following:

- D_{1111}.
- D_{1122}.
- D_{2222}.
- D_{1133}.
- D_{2233}.
- D_{3333}.
- D_{1112}.
- D_{2212}.
- D_{3312}.
- D_{1212}.

- D_{1113}.
- D_{2213}.
- D_{3313}.
- D_{1213}.
- D_{1313}.
- D_{1123}.
- D_{2223}.
- D_{3323}.
- D_{1223}.
- D_{1323}.
- D_{2323}.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=TRACTION, the table data specify the following:

- E for warping elements; E_{nn} for cohesive elements.
- G_1 for warping elements; E_{ss} for cohesive elements.
- G_2 for warping elements; E_{tt} for cohesive elements.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=BILAMINA, the table data specify the following:

- E_{1+}.
- E_{2+}.
- ν_{12+}.
- G_{12}.
- E_{1-}.
- E_{2-}.
- ν_{12-}.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.

- Value of the second field variable.
- Etc.

If *type*=SHORT_FIBER, there is no table data.

Return value

An Elastic object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the Elastic object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Elastic* method.

Return value

`None.`

Exceptions

RangeError.

Members

The Elastic object has members with the same names and descriptions as the arguments to the *Elastic* method.

In addition, the Elastic object can have the following members:

failStress A *FailStress* object.

failStrain A *FailStrain* object.

Corresponding analysis keywords

ElectricalConductivity object

The ElectricalConductivity object specifies electrical conductivity.

Access

```
import material
mdb.models[name].materials[name].electricalConductivity
import odbMaterial
session.odbs[name].materials[name].electricalConductivity
```

ElectricalConductivity(...)

This method creates an ElectricalConductivity object.

Path

```
mdb.models[name].materials[name].ElectricalConductivity
session.odbs[name].materials[name].ElectricalConductivity
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

type A SymbolicConstant specifying the type of electrical conductivity. Possible values are ISOTROPIC, ORTHOTROPIC, and ANISOTROPIC. The default value is ISOTROPIC.

frequencyDependency A Boolean specifying whether the data depend on frequency. The default value is OFF.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

If *type*=ISOTROPIC, the table data specify the following:

- Electrical conductivity.
- Frequency, if the data depend on frequency.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=ORTHOTROPIC, the table data specify the following:

- σ_{11}^{E}.
- σ_{22}^{E}.
- σ_{33}^{E}.
- Frequency, if the data depend on frequency.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=ANISOTROPIC, the table data specify the following:

- σ_{11}^{E}.
- σ_{12}^{E}.
- σ_{22}^{E}.
- σ_{13}^{E}.
- σ_{23}^{E}.
- σ_{33}^{E}.
- Frequency, if the data depend on frequency.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

An ElectricalConductivity object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the ElectricalConductivity object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ElectricalConductivity* method.

Return value

`None.`

Exceptions

RangeError.

Members

The ElectricalConductivity object has members with the same names and descriptions as the arguments to the *ElectricalConductivity* method.

Corresponding analysis keywords

- **ELECTRICAL CONDUCTIVITY*

Electrode object

The Electrode object specifies electrode material properties.

Access

```
import material
mdb.models[name].materials[name].electrode
```

Electrode(...)

This method creates an Electrode object.

Path

```
mdb.models[name].materials[name].Electrode
```

Required arguments

type

A SymbolicConstant specifying the type of electrode. Possible values are:

- ANODE
- CATHODE
- SEPERATOR

Optional arguments

solidPhaseVolFraction

A Float specifying the volume fraction of the solid phase in the electrode. The default value is 0.

liqPhaseVolFraction

A Float specifying the volume fraction of the liquid phase or electrolyte in the electrode. The default value is 0.

binderVolFraction

A Float specifying the volume fraction of the binder material in the electrode. The default value is 0.

inactiveSolidPhaseVolFraction

A Float specifying the volume fraction of the inactive solid phase in the electrode. The default value is 0.

utilizationFraction

A Float specifying the fraction of utilization of the cathode and anode regions. The default value is 0.

bruggemanZ

A Float specifying the Bruggeman exponent in the thickness direction. The default value is 0.

bruggemanX

A Float specifying the Bruggeman exponent in the manufacturing direction. The default value is 0.

bruggemanY

A Float specifying the Bruggeman exponent in the transverse direction. The default value is 0.

convection

A Float specifying the convection effects of the electrolyte due to swelling in the electrode. The default value is 0.

Return value

An Electrode object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the Electrode object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Electrode* method.

Return value

`None.`

Exceptions

RangeError.

`DefineDetails(...)`

This method specifies the details of the Electrode object.

Required arguments

subType

A string specifying the property or parameter table type that describes the behavior of the electrode. Allowable property table/parameter table types are:

- *ABQ_EChemPET_Arrhenius*
- *ABQ_EChemPET_CubicSplineC2*
- *ABQ_EChemPET_Electrode_Swelling*
- *ABQ_EChemPET_Electrode_ElecCond_Tabular*
- *ABQ_EChemPET_LogScale_Tabular*

data

An array of properties of the specified material definition type.

Optional arguments

Return value

`None.`

Exceptions

RangeError.

`EditDetails(...)`

This method specifies the details of the Electrode object.

Required arguments

Required arguments of the `EditDetails` are the same as *`DefineDetails`*.

Optional arguments

Return value

`None.`

Exceptions

RangeError.

Members

The Electrode object has members with the same names and descriptions as the arguments to the *Electrode* method.

Electrode Particle object

The Electrode Particle object specifies electrode particle material properties.

Access

```
import material
mdb.models[name].materials[name].electrode.particles
```

Particle(...)

This method creates a Electrode Particle object.

Path

```
mdb.models[name].materials[name].electrode.Particle
```

Required arguments

name	A String specifying the unique name of the microscale particle.
particleOuterRadius	A Float specifying the outer radius of the microscale particle.
particleVolumeFraction	A Float specifying the ratio of the volume fraction of the particle with respect to the solid volume fraction of the electrode.
particleIonConcentration	A Float specifying the initial concentration of the lithium in the microscale particle.

Optional arguments

Return value

A Electrode Particle object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the Electrode Particle object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Particle* method.

Return value
None.

Exceptions

RangeError.

DefineDetails(...)

This method specifies the details of the Electrode Particle object.

Required arguments

subType A string specifying the property table/parameter table type that describes the behavior of the particle. Allowable property table/parameter table types are:

- *ABQ_EChemPET_Electrode_Particle_ButlerVolmer*
- *ABQ_EChemPET_Electrode_Particle_ElectrodeDissolution*
- *ABQ_EChemPET_Electrode_Particle_PowerLoss*
- *ABQ_EChemPET_Electrode_Particle_CurrXchgDens_CrackSEI_Tabular*
- *ABQ_EChemPET_Electrode_Particle_CurrXchgDens_ElecDiss_Tabular*
- *ABQ_EChemPET_Electrode_Particle_CurrXchgDens_LPL_Tabular*

Electrode Particle Layer object

The Electrode Particle Layer object specifies electrode particle layer material properties.

Access

```
import material
mdb.models[name].materials[name].electrode.particles[name].layers
```

Layer(...)

This method creates a Layer object.

Path

```
mdb.models[name].materials[name].electrode.particles[name].Layer
```

Required arguments

Optional arguments

name	A String specifying the unique name of the particle layer.
weightFraction	A Float specifying the weight fraction of the layer.

Return value

A Electrode Particle Layer object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the Electrode Particle Layer object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Layer* method.

Return value

`None.`

Exceptions

RangeError.

`DefineDetails(...)`

This method specifies the details of the Electrode Particle Layer object.

Required arguments

subType
A string specifying the property table/parameter table type that describes the behavior of the layer. Allowable property table/parameter table types are:

- *ABQ_EChemPET_Electrode_Particle_Layer_Diffusion*
- *ABQ_EChemPET_Electrode_Particle_Layer_Discretization*
- *ABQ_EChemPET_Electrode_Particle_Layer_DsTabular*
- *ABQ_EChemPET_Electrode_Particle_Layer_OCPTabular*
- *ABQ_EChemPET_Electrode_Particle_Layer_SwellingTabular*

data
An array of properties of the specified material definition type.

Optional arguments

Return value
`None.`

Exceptions

RangeError.

`EditDetails(...)`

This method specifies the details of the Electrode Particle Layer object.

Required arguments

Required arguments of the `EditDetails` are the same as *`DefineDetails`*.

Optional arguments

Return value
`None.`

Exceptions

RangeError.

Members

The Layer object has members with the same names and descriptions as the arguments to the *Layer* method.

Electrolyte object

The Electrolyte object specifies electrolyte material properties.

Access

```
import material
mdb.models[name].materials[name].electrolyte
```

Electrolyte(...)

This method creates an Electrolyte object.

Path

```
mdb.models[name].materials[name].Electrolyte
```

Required arguments

chargeNum A Float specifying the charge number of the lithium ion battery.

Optional arguments

Return value

An Electrolyte object.

Exceptions

RangeError.

setValues(...)

This method modifies the Electrolyte object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Electrolyte* method.

Return value

`None.`

Exceptions

RangeError.

DefineDetails(...)

This method specifies the details of the Electrolyte object.

Required arguments

subType

A string specifying the property or parameter table type that describes the behavior of the electrolyte. Allowable property table/parameter table types are:

- *ABQ_EChemPET_Electrolyte_MolarActivityCoeff_fPM*
- *ABQ_EChemPET_Electrolyte_DiffTabular*
- *ABQ_EChemPET_Electrolyte_ElecCond_Tabular*
- *ABQ_EChemPET_Electrolyte_Transference*

data

An array of properties of the specified material definition type.

Optional arguments

Return value

`None.`

Exceptions

RangeError.

`EditDetails(...)`

This method specifies the details of the Electrolyte object.

Required arguments

Required arguments of the `EditDetails` are the same as *`DefineDetails`*.

Optional arguments

Return value

`None.`

Exceptions

RangeError.

Members

The Electrolyte object has members with the same names and descriptions as the arguments to the *Electrolyte* method.

import material
mdb.models[name].materials[name].eos
import odbMaterial
session.odbs[name].materials[name].eos
```

Eos(...)

This method creates an Eos object.

Path

```
mdb.models[name].materials[name].Eos
session.odbs[name].materials[name].Eos
```

Required arguments

None.

Optional arguments

type

A SymbolicConstant specifying the equation of state. Possible values are USUP, JWL, IDEALGAS, TABULAR, and IGNITIONANDGROWTH. The default value is IDEALGAS.

temperatureDependency

A Boolean specifying whether the data in *gasSpecificTable* depend on temperature. The default value is OFF.

dependencies

An Int specifying the number of field variable dependencies for the data in *gasSpecificTable*. The default value is 0.

detonationEnergy

A Float specifying the detonation energy text field. The default value is 0.0.

solidTable

A sequence of sequences of Floats specifying the following:

- A_{s}.
- B_{s}.
- ${\omega}_{s}$.
- R_{1s}.
- R_{2s}.

The default value is an empty sequence.

gasTable

A sequence of sequences of Floats specifying the following:

- A_{g}.
- B_{g}.

- ${\omega}_{g}$.
- R_{1g}.
- R_{2g}.

The default value is an empty sequence.

reactionTable

A sequence of sequences of Floats specifying the following:

- Initial Pressure, I.
- Product co-volume, a.
- Exponent on the unreacted fraction (ignition term), x.
- First burn rate coefficient, G_{1}
- Exponent on the unreacted fraction (growth term), c.
- Exponent on the reacted fraction (growth term), d.
- Pressure exponent (growth term), y.
- Second burn rate coefficient, G_{2}.
- Exponent on the unreacted fraction (completion term), e.
- Exponent on the reacted fraction (completion term), g.
- Pressure exponent (completion term), z.
- Initial reacted fraction, ${F^{max}}_{ig}$.
- Maximum reacted fraction for the growth term, ${F^{max}}_{G1}$.
- Minimum reacted fraction, ${F^{min}}_{G2}$.

The default value is an empty sequence.

gasSpecificTable

A sequence of sequences of Floats specifying the following:

- Specific Heat per unit mass.
- Temperature dependent data.
- Value of first field variable.
- Value of second field variable.
- Etc.

The default value is an empty sequence.

table

A sequence of sequences of Floats specifying the items described below. The default value is an empty sequence.

Table data

If *type*=IDEALGAS, the table data represents the following:

- Gas constant, R.
- The ambient pressure, p_A. If this field is left blank, a default of 0.0 is used.

If *type*=JWL, the table data represents the following:

- Detonation wave speed, C_d.
- A.
- B.
- ω. (Dimensionless.)
- R_1. (Dimensionless.)
- R_2. (Dimensionless.)
- Pre-detonation bulk modulus, K_{pd}.
- Detonation energy density, E_0.

If *type*=USUP, the table data represents the following:

- c_0.
- s. (Dimensionless.)
- Γ_0. (Dimensionless.)

If *type*=TABULAR, the table data represents the following:

- F_1.
- F_2.
- ε_{vol}^c. (Dimensionless.)

Return value

An Eos object.

Exceptions

None.

`setValues(...)`

This method modifies the Eos object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Eos* method.

Return value

`None.`

Exceptions

None.

Members

The Eos object has members with the same names and descriptions as the arguments to the *Eos* method.

In addition, the Eos object can have the following members:

detonationPoint	A *DetonationPoint* object.
eosCompaction	An *EosCompaction* object.
tensileFailure	A *TensileFailure* object.

Corresponding analysis keywords

- **EOS*

EosCompaction object

The EosCompaction object specifies material eos compaction.

Access

```
import material
mdb.models[name].materials[name].eos.eosCompaction
import odbMaterial
session.odbs[name].materials[name].eos.eosCompaction
```

EosCompaction(...)

This method creates an EosCompaction object.

Path

```
mdb.models[name].materials[name].eos.EosCompaction
session.odbs[name].materials[name].eos.EosCompaction
```

Required arguments

soundSpeed	A Float specifying reference sound speed in the porous material.
porosity	A Float specifying value of the porosity of the unloaded material.
pressure	A Float specifying pressure required to initialize plastic behavior.
compactionPressure	A Float specifying compaction pressure at which all pores are crushed.

Optional arguments

None.

Return value

An EosCompaction object.

Exceptions

RangeError.

setValues(...)

This method modifies the EosCompaction object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *EosCompaction* method.

Return value

`None.`

Exceptions

RangeError.

Members

The EosCompaction object has members with the same names and descriptions as the arguments to the *EosCompaction* method.

Corresponding analysis keywords

- **EOS COMPACTION*

Expansion object

The Expansion object specifies thermal expansion.

Access

```
import material
mdb.models[name].materials[name].expansion
import odbMaterial
session.odbs[name].materials[name].expansion
```

Expansion(...)

This method creates an Expansion object.

Path

```
mdb.models[name].materials[name].Expansion
session.odbs[name].materials[name].Expansion
```

Required arguments

None.

Optional arguments

type A SymbolicConstant specifying the type of expansion. Possible values are ISOTROPIC, ORTHOTROPIC, ANISOTROPIC, and SHORT_FIBER. The default value is ISOTROPIC.

userSubroutine A Boolean specifying whether a user subroutine is used to define the increments of thermal strain. The default value is OFF.

zero A Float specifying the value of θ^0 if the thermal expansion is temperature-dependent or field-variable-dependent. The default value is 0.0.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

table A sequence of sequences of Floats specifying the items described below. The default value is an empty sequence.

This argument is required only if *type* is not USER.

Table data

If *type*=ISOTROPIC, the table data specify the following:

- α in Abaqus/Standard or Abaqus/Explicit analysis.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.

- Value of the second field variable.
- Etc.

If *type*=ORTHOTROPIC, the table data specify the following:

- α_{11}.
- α_{22}.
- α_{33}.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=ANISOTROPIC, the table data specify the following:

- α_{11}.
- α_{22}.
- α_{33}. (Not used for plane stress case.)
- α_{12}.
- α_{13}.
- α_{23}.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=SHORT_FIBER, there is no table data.

Return value

An Expansion object.

Exceptions

RangeError.

setValues(...)

This method modifies the Expansion object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Expansion* method.

Return value
`None.`

Exceptions
RangeError.

Members
The Expansion object has members with the same names and descriptions as the arguments to the *Expansion* method.

Corresponding analysis keywords
- **EXPANSION*

FailStrain object

The FailStrain object defines parameters for strain-based failure measures.

Access

```
import material
mdb.models[name].materials[name].elastic.failStrain
import odbMaterial
session.odbs[name].materials[name].elastic.failStrain
```

FailStrain(...)

This method creates a FailStrain object.

Path

```
mdb.models[name].materials[name].elastic.FailStrain
session.odbs[name].materials[name].elastic.FailStrain
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- Tensile strain limit in fiber direction, $X_{\varepsilon t}$.
- Compressive strain limit in fiber direction, $X_{\varepsilon c}$.
- Tensile strain limit in transverse direction, $Y_{\varepsilon t}$.
- Compressive strain limit in transverse direction, $Y_{\varepsilon c}$.
- Shear strain limit in the X–Y plane, S_{ε}.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A FailStrain object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the FailStrain object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *FailStrain* method.

Return value

`None.`

Exceptions

RangeError.

Members

The FailStrain object has members with the same names and descriptions as the arguments to the *FailStrain* method.

Corresponding analysis keywords

- **FAIL STRAIN*

FailStress object

The FailStress object defines parameters for stress-based failure measures.

Access

```
import material
mdb.models[name].materials[name].elastic.failStress
import odbMaterial
session.odbs[name].materials[name].elastic.failStress
```

FailStress(...)

This method creates a FailStress object.

Path

```
mdb.models[name].materials[name].elastic.FailStress
session.odbs[name].materials[name].elastic.FailStress
```

Required arguments

table
A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency
A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- Tensile stress limit in fiber direction, X_t.
- Compressive stress limit in fiber direction, X_c.
- Tensile stress limit in transverse direction, Y_t.
- Compressive stress limit in transverse direction, Y_c.
- Shear strength in the X–Y plane, S.
- Cross product term coefficient, $\overset{*}{f}$ ($-1.0 \leq \overset{*}{f} \leq 1.0$). The default value is zero.
- Biaxial stress limit, σ_{biax}.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A FailStress object.

Exceptions

RangeError.

setValues(...)

This method modifies the FailStress object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *FailStress* method.

Return value

`None.`

Exceptions

RangeError.

Members

The FailStress object has members with the same names and descriptions as the arguments to the *FailStress* method.

Corresponding analysis keywords

- **FAIL STRESS*

FailureRatios object

The FailureRatios object specifies the shape of the failure surface for a *Concrete* model.

Access

```
import material
mdb.models[name].materials[name].concrete.failureRatios
import odbMaterial
session.odbs[name].materials[name].concrete.failureRatios
```

FailureRatios(...)

This method creates a FailureRatios object.

Path

```
mdb.models[name].materials[name].concrete.FailureRatios
session.odbs[name].materials[name].concrete.FailureRatios
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- Ratio of the ultimate biaxial compressive stress to the uniaxial compressive ultimate stress. The default value is 1.16.
- Absolute value of the ratio of the uniaxial tensile stress at failure to the uniaxial compressive stress at failure. The default value is 0.09.
- Ratio of the magnitude of a principal component of plastic strain at ultimate stress in biaxial compression to the plastic strain at ultimate stress in uniaxial compression. The default value is 1.28.
- Ratio of the tensile principal stress value at shear in plane stress, when the other nonzero principal stress component is at the ultimate compressive stress value, to the tensile cracking stress under uniaxial tension. The default value is 1/3.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A FailureRatios object.

Exceptions

RangeError.

setValues(...)

This method modifies the FailureRatios object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *FailureRatios* method.

Return value

`None.`

Exceptions

RangeError.

Members

The FailureRatios object has members with the same names and descriptions as the arguments to the *FailureRatios* method.

Corresponding analysis keywords

- **FAILURE RATIOS*

FluidLeakoff object

The FluidLeakoff object specifies leak-off coefficients for pore pressure cohesive elements.

Access

```
import material
mdb.models[name].materials[name].fluidLeakoff
import odbMaterial
session.odbs[name].materials[name].fluidLeakoff
```

FluidLeakoff(...)

This method creates a FluidLeakoff object.

Path

```
mdb.models[name].materials[name].FluidLeakoff
session.odbs[name].materials[name].FluidLeakoff
```

Required arguments

None.

Optional arguments

temperatureDependency	A Boolean specifying whether the data depend on temperature. The default value is OFF.
dependencies	An Int specifying the number of field variable dependencies. The default value is 0.
type	A SymbolicConstant specifying the type of fluid leak-off. Possible values are COEFFICIENTS and USER. The default value is COEFFICIENTS.
table	A sequence of sequences of Floats specifying the items described below. The default value is an empty sequence.

Table data

The table data specify the following:

- Fluid leak-off coefficient at top element surface.
- Fluid leak-off coefficient at bottom element surface.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A FluidLeakoff object.

Exceptions

None.

setValues(...)

This method modifies the FluidLeakoff object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *FluidLeakoff* method.

Return value

`None.`

Exceptions

None.

Members

The FluidLeakoff object has members with the same names and descriptions as the arguments to the *FluidLeakoff* method.

Corresponding analysis keywords

- **FLUID LEAKOFF*

GapConductance object

The GapConductance object specifies conductive heat transfer between closely adjacent (or contacting) surfaces.

Access

```
import material
mdb.models[name].materials[name].gapConductance
import odbMaterial
session.odbs[name].materials[name].gapConductance
```

GapConductance(...)

This method creates a GapConductance object.

Path

```
mdb.models[name].materials[name].GapConductance
session.odbs[name].materials[name].GapConductance
```

Required arguments

Optional arguments

pressureDependency	A Boolean specifying whether the data depend on pressure. The default value is OFF.
dependencies	An Int specifying the number of field variable dependencies. The default value is 0.
table	A sequence of sequences of Floats specifying the items described below.

Table data

- Gap Conductance or Cohesive Separation.
- Gap Clearance, Gap Pressure (if optional parameter pressureDependency is used), or Closure, c (for coupled temperature-displacement gasket elements).
- Average Temperature if the data depend on temperature.
- Mass Flow Rate per unit area if the data depend on the average mass flow rate.
- Value of the first field variable if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A GapConductance object.

`setValues(...)`

This method modifies the GapConductance object.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *GapConductance* method.

Members

The GapConductance object has members with the same names and descriptions as the arguments to the *GapConductance* method.

Corresponding analysis keywords

- *GAP CONDUCTANCE*

GapConvection object

The GapConvection object specifies the Nusselt number (**Nu**) to calculate the convective coefficient for heat transfer between the gap flow and both the top and bottom surfaces of a coupled temperature-pore pressure cohesive element.

Access

```
import material
mdb.models[name].materials[name].gapConvection
import odbMaterial
session.odbs[name].materials[name].gapConvection
```

GapConvection(...)

This method creates a GapConvection object.

Path

```
mdb.models[name].materials[name].GapConvection
session.odbs[name].materials[name].GapConvection
```

Required arguments

type An odb_String specifying the type of gap convection. Possible values are FLUX, TEMPERATURE, and TABULAR. The default value is FLUX.

Optional arguments

If *type*=TABULAR, the following optional arguments can be used:

table A sequence of sequences of Floats specifying the items described below.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

For *type*=TABULAR the table data specify the following:

- Nusselt number (**Nu**)
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A GapConvection object.

Exceptions

None.

setValues(...)

This method modifies the GapConvection object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *GapConvection* method.

Return value

`None.`

Members

The GapConvection object has members with the same names and descriptions as the arguments to the *GapConvection* method.

Corresponding analysis keywords

- **GAP CONVECTION*

GapFlow object

The GapFlow object specifies tangential flow constitutive parameters for pore pressure cohesive elements.

Access

```
import material
mdb.models[name].materials[name].gapFlow
import odbMaterial
session.odbs[name].materials[name].gapFlow
```

GapFlow(...)

This method creates a GapFlow object.

Path

```
mdb.models[name].materials[name].GapFlow
session.odbs[name].materials[name].GapFlow
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

kmax `None` or a Float specifying the maximum permeability value that should be used. If *kmax*=`None`, Abaqus assumes that the permeability is not bounded. This value is meaningful only when *type*=NEWTONIAN. The default value is `None`.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

type A SymbolicConstant specifying the type of gap flow. Possible values are NEWTONIAN, POWER_LAW, BINGHAM_PLASTIC, and HERSCHEL-BULKLEY. The default value is NEWTONIAN.

Table data

If *type*=NEWTONIAN the table data specify the following:

- Pore viscosity.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=POWER_LAW the table data specify the following:

- Consistency.
- Exponent.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=BINGHAM_PLASTIC the table data specify the following:

- Consistency.
- Yield stress.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=HERSCHEL-BULKLEY the table data specify the following:

- Consistency.
- Exponent.
- Yield stress.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A GapFlow object.

Exceptions

None.

`setValues(...)`

This method modifies the GapFlow object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *GapFlow* method.

Return value

`None.`

Exceptions

None.

Members

The GapFlow object has members with the same names and descriptions as the arguments to the *GapFlow* method.

Corresponding analysis keywords

- **GAP FLOW*

GapRadiation object

The GapRadiation object specifies radiative heat transfer between closely adjacent surfaces.

Access

```
import material
mdb.models[name].materials[name].gapRadiation
import odbMaterial
session.odbs[name].materials[name].gapRadiation
```

GapRadiation(...)

This method creates a GapRadiation object.

Path

```
mdb.models[name].materials[name].Gapradiation
session.odbs[name].materials[name].Gapradiation
```

Required arguments

mainSurfaceEmissivity	A Float specifying the Emissivity of main surface.ϵ_A
secondarySurfaceEmissivity	A Float specifying the Emissivity of the secondary surfaceϵ_B.
table	A sequence of sequences of Floats specifying the items described below.

Optional arguments

Table data

- Effective view factor.
- Gap clearance.
- Repeat this data line as often as necessary to define the dependence of the view factor on gap clearance.

Return value

A Gapradiation object.

Exceptions

None.

setValues(...)

This method modifies the GapRadiation object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *GapRadiation* method.

Return value

`None.`

Exceptions

None.

Members

The Gap Radiation object has members with the same names and descriptions as the arguments to the *GapRadiation* method.

Corresponding analysis keywords

- **GAP RADIATION*

GasketMembraneElastic object

The GasketMembraneElastic object defines the elastic parameters for the membrane shear behavior of a gasket.

Access

```
import material
mdb.models[name].materials[name].gasketMembraneElastic
import odbMaterial
session.odbs[name].materials[name].gasketMembraneElastic
```

GasketMembraneElastic(...)

This method creates a GasketMembraneElastic object.

Path

```
mdb.models[name].materials[name].GasketMembraneElastic
session.odbs[name].materials[name].GasketMembraneElastic
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- Young's modulus, E.
- Poisson's ratio, ν.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A GasketMembraneElastic object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the GasketMembraneElastic object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *GasketMembraneElastic* method.

Return value

`None.`

Exceptions

RangeError.

Members

The GasketMembraneElastic object has members with the same names and descriptions as the arguments to the *GasketMembraneElastic* method.

Corresponding analysis keywords

GasketThicknessBehavior object

The GasketThicknessBehavior object defines the behavior in the thickness direction for a gasket.

Access

```
import material
mdb.models[name].materials[name].gasketThicknessBehavior
import odbMaterial
session.odbs[name].materials[name].gasketThicknessBehavior
```

GasketThicknessBehavior(...)

This method creates a GasketThicknessBehavior object.

Path

```
mdb.models[name].materials[name].GasketThicknessBehavior
session.odbs[name].materials[name].GasketThicknessBehavior
```

Required arguments

table
A sequence of sequences of Floats specifying loading data. The first sequence must contain only 0. At least two sequences must be specified if *type*=DAMAGE, and at least 3 sequences must be specified if *type*=ELASTIC_PLASTIC. The items in the table data are described below.

Optional arguments

temperatureDependency
A Boolean specifying whether the loading data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of field variable dependencies included in the definition of the loading data, in addition to temperature. The default value is 0.

tensileStiffnessFactor
A Float specifying the fraction of the initial compressive stiffness that defines the stiffness in tension. The default value is 10^{-3}.

type
A SymbolicConstant specifying a damage elasticity model or an elastic-plastic model for gasket thickness-direction behavior. Possible values are ELASTIC_PLASTIC and DAMAGE. The default value is ELASTIC_PLASTIC.

unloadingDependencies
An Int specifying the number of field variable dependencies included in the definition of the unloading data, in addition to temperature. The default value is 0.

unloadingTemperatureDependency
A Boolean specifying whether unloading data depends on temperature. The default value is OFF.

variableUnits

A SymbolicConstant specifying the behavior in terms of units of force (or force in unit length) versus closure or pressure versus closure. Possible values are STRESS and FORCE. The default value is STRESS.

yieldOnset

A Float specifying the closure value at which the onset of yield occurs or the relative drop in slope on the loading curve that defines the onset of plastic deformation (depending on the value of *yieldOnsetMethod*). The default value is 0.1.

yieldOnsetMethod

A SymbolicConstant specifying the method used to determine yield onset. Possible values are RELATIVE_SLOPE_DROP and CLOSURE_VALUE. The default value is RELATIVE_SLOPE_DROP.

unloadingTable

A sequence of sequences of Floats specifying unloading data. The items in the table data are described below. The default value is an empty sequence.

Table data

If *variableUnits*=STRESS, the loading table data specify the following:

- Pressure; this value must be positive.
- Closure; this value must be positive.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *variableUnits*=FORCE, the loading table data specify the following:

- Force or force per unit length; this value must be positive.
- Closure; this value must be positive.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *variableUnits*=STRESS and *type*=ELASTIC_PLASTIC, the *unloadingTable* data specify the following:

- Pressure; this value must be positive.
- Closure; this value must be positive.
- Plastic closure; this value must be positive.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *variableUnits*=FORCE and *type*=ELASTIC_PLASTIC, the *unloadingTable* data specify the following:

- Pressure; this value must be positive.
- Closure; this value must be positive.
- Plastic closure; this value must be positive.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *variableUnits*=STRESS and *type*=DAMAGE, the *unloadingTable* data specify the following:

- Pressure; this value must be positive.
- Closure; this value must be positive.
- Maximum closure reached while loading the gasket; this value must be positive.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *variableUnits*=FORCE and *type*=DAMAGE, the *unloadingTable* data specify the following:

- Force or force per unit length; this value must be positive.
- Closure; this value must be positive.
- Maximum closure reached while loading the gasket; this value must be positive.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A GasketThicknessBehavior object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the GasketThicknessBehavior object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *GasketThicknessBehavior* method.

Return value

```
None.
```

Exceptions

RangeError.

Members

The GasketThicknessBehavior object has members with the same names and descriptions as the arguments to the *GasketThicknessBehavior* method.

In addition, the GasketThicknessBehavior object can have the following member:

contactArea
A *ContactArea* object.

Corresponding analysis keywords

- **GASKET THICKNESS BEHAVIOR*

GasketTransverseShearElastic object

The GasketTransverseShearElastic object defines the elastic parameters for the transverse shear behavior of a gasket.

Access

```
import material
mdb.models[name].materials[name].gasketTransverseShearElastic
import odbMaterial
session.odbs[name].materials[name].gasketTransverseShearElastic
```

GasketTransverseShearElastic(...)

This method creates a GasketTransverseShearElastic object.

Path

```
mdb.models[name].materials[name].GasketTransverseShearElastic
session.odbs[name].materials[name].GasketTransverseShearElastic
```

Required arguments

table
A sequence of sequences of Floats specifying the items described below.

Optional arguments

variableUnits
A SymbolicConstant specifying the unit system in which the transverse shear behavior will be defined. Possible values are STRESS and FORCE. The default value is STRESS.

temperatureDependency
A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- Shear stiffness. (This value cannot be negative.)
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A GasketTransverseShearElastic object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the GasketTransverseShearElastic object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *GasketTransverseShearElastic* method.

Return value

`None.`

Exceptions

RangeError.

Members

The GasketTransverseShearElastic object has members with the same names and descriptions as the arguments to the *GasketTransverseShearElastic* method.

Gel object

The Gel object defines a swelling gel.

Access

```
import material
mdb.models[name].materials[name].gel
import odbMaterial
session.odbs[name].materials[name].gel
```

Gel(...)

This method creates a Gel object.

Path

```
mdb.models[name].materials[name].Gel
session.odbs[name].materials[name].Gel
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

None.

Table data

- Radius of gel particles when completely dry, r_a^{dry}.
- Fully swollen radius of gel particles, r_a^f.
- Number of gel particles per unit volume, k_a.
- Relaxation time constant for long-term swelling of gel particles, τ_1.

Return value

A Gel object.

Exceptions

None.

setValues(...)

This method modifies the Gel object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Gel* method.

Return value

`None.`

Exceptions

None.

Members

The Gel object has members with the same names and descriptions as the arguments to the *Gel* method.

HeatGeneration object

The HeatGeneration object includes volumetric heat generation in heat transfer analyses.

Access

```
import material
mdb.models[name].materials[name].heatGeneration
import odbMaterial
session.odbs[name].materials[name].heatGeneration
```

HeatGeneration()

This method creates a HeatGeneration object.

Path

```
mdb.models[name].materials[name].HeatGeneration
session.odbs[name].materials[name].HeatGeneration
```

Arguments

None.

Return value

A HeatGeneration object.

Exceptions

None.

Members

The HeatGeneration object has no members.

Corresponding analysis keywords

- **HEAT GENERATION*

Hyperelastic object

The Hyperelastic object specifies elastic properties for approximately incompressible elastomers.

Access

```
import material
mdb.models[name].materials[name].hyperelastic
import odbMaterial
session.odbs[name].materials[name].hyperelastic
```

Hyperelastic(...)

This method creates a Hyperelastic object.

Path

```
mdb.models[name].materials[name].Hyperelastic
session.odbs[name].materials[name].Hyperelastic
```

Required arguments

table

A sequence of sequences of Floats specifying the items described below. This argument is valid only if *testData*=OFF.

Optional arguments

type

A SymbolicConstant specifying the type of strain energy potential. Possible values are:

- ARRUDA_BOYCE
- MARLOW
- MOONEY_RIVLIN
- NEO_HOOKE
- OGDEN
- POLYNOMIAL
- REDUCED_POLYNOMIAL
- USER
- VAN_DER_WAALS
- YEOH
- UNKNOWN
- VALANIS_LANDEL

The default value is UNKNOWN.

moduliTimeScale

A SymbolicConstant specifying the nature of the time response. Possible values are INSTANTANEOUS and LONG_TERM. The default value is LONG_TERM.

temperatureDependency

A Boolean specifying whether the data depend on temperature. The default value is OFF.

n

An Int specifying the order of the strain energy potential. The default value is 1.

If *testData*=ON and *type*=POLYNOMIAL, *n* can take only the values 1 or 2.

If *testData*=ON and *type*=OGDEN or if *testData*=OFF for either type, $1 \leq n \leq 6$.

If *type*=USER, this argument cannot be used.

beta

The SymbolicConstant FITTED_VALUE or a Float specifying the invariant mixture parameter. This argument is valid only if *testData*=ON and *type*=VAN_DER_WAALS. The default value is FITTED_VALUE.

testData

A Boolean specifying whether test data are supplied. The default value is ON.

compressible

A Boolean specifying whether the hyperelastic material is compressible. This parameter is applicable only to user-defined hyperelastic materials. The default value is OFF.

properties

An Int specifying the number of property values needed as data for the user-defined hyperelastic material. The default value is 0.

deviatoricResponse

A SymbolicConstant specifying which test data to use. Possible values are UNIAXIAL, BIAXIAL, and PLANAR. The default value is UNIAXIAL.

volumetricResponse

A SymbolicConstant specifying the volumetric response. Possible values are DEFAULT, VOLUMETRIC_DATA, POISSON_RATIO, and LATERAL_NOMINAL_STRAIN. The default value is DEFAULT.

poissonRatio

A Float specifying the Poisson's ratio. This argument is valid only if *volumetricResponse*=POISSON_RATIO. The default value is 0.0.

materialType

A SymbolicConstant specifying the type of material. Possible values are ISOTROPIC and ANISOTROPIC. The default value is ISOTROPIC.

anisotropicType

A SymbolicConstant specifying the type of strain energy potential. Possible values are FUNG_ANISOTROPIC, FUNG_ORTHOTROPIC, HOLZAPFEL, and USER_DEFINED. The default value is FUNG_ANISOTROPIC.

formulation

A SymbolicConstant specifying the type of formulation. Possible values are STRAIN and INVARIANT. The default value is STRAIN.

behaviorType

A SymbolicConstant specifying the type of anisotropic hyperelastic material behavior. Possible values are INCOMPRESSIBLE and COMPRESSIBLE. The default value is INCOMPRESSIBLE.

dependencies

An Int specifying the number of field variable dependencies for the data in*volumetricTable*. The default value is 0.

localDirections

An Int specifying the number of local directions for the data in*volumetricTable*. The default value is 0.

Table data

If *type*=ARRUDA_BOYCE, the table data specify the following:

- μ.
- λ_m.
- D.
- Temperature, if the data depend on temperature.

If *type*=MOONEY_RIVLIN, the table data specify the following:

- C_{10}.
- C_{01}.
- D_1.
- Temperature, if the data depend on temperature.

If *type*=NEO_HOOKE, the table data specify the following:

- C_{10}.
- D_1.
- Temperature, if the data depend on temperature.

If *type*=OGDEN, the table data specify the following for values of n:

- μ_i and α_i for i from 1 to n.
- n coefficients D_i.
- Temperature, if the data depend on temperature. Temperature dependence is not allowed for $4 \leq n \leq 6$ in an Abaqus/Explicit analysis.

If *type*=POLYNOMIAL, the table data specify the following for values of n:

- C_{ij} for each value of $(i + j)$ from 1 to n with i decreasing from $(i + j)$ to zero and j increasing from zero to $(i + j)$.
- n coefficients D_i.
- Temperature, if the data depend on temperature. Temperature dependence is not allowed for $3 \leq n \leq 6$ in an Abaqus/Explicit analysis.

If *type*=REDUCED_POLYNOMIAL, the table data specify the following for values of n:

- C_{i0} for i from 1 to n.
- n coefficients D_i.
- Temperature, if the data depend on temperature. Temperature dependence is not allowed for $4 \leq n \leq 6$ in an Abaqus/Explicit analysis.

If *type*=VAN_DER_WAALS, the table data specify the following:

- μ.
- λ_m.

- a.
- β.
- D.
- Temperature, if the data depend on temperature.

If *type*=YEOH, the table data specify the following:

- C_{10}.
- C_{20}.
- C_{30}.
- D_1.
- D_2.
- D_3.
- Temperature, if the data depend on temperature. Temperature dependence is not allowed in an Abaqus/Explicit analysis.

The `None` object is the default value if *testData*=ON.

Return value

A Hyperelastic object.

Exceptions

InvalidNameError and RangeError.

`setValues(...)`

This method modifies the Hyperelastic object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Hyperelastic* method.

Return value

`None`.

Exceptions

RangeError.

Members

The Hyperelastic object has members with the same names and descriptions as the arguments to the *Hyperelastic* method.

In addition, the Hyperelastic object can have the following members:

biaxialTestData	A *BiaxialTestData* object.
planarTestData	A *PlanarTestData* object.
uniaxialTestData	A *UniaxialTestData* object.
volumetricTestData	A *VolumetricTestData* object.
hysteresis	A *Hysteresis* object.

Corresponding analysis keywords

Hyperfoam object

The Hyperfoam object specifies elastic properties for a hyperelastic foam.

Access

```
import material
mdb.models[name].materials[name].hyperfoam
import odbMaterial
session.odbs[name].materials[name].hyperfoam
```

Hyperfoam(...)

This method creates a Hyperfoam object.

Path

```
mdb.models[name].materials[name].Hyperfoam
session.odbs[name].materials[name].Hyperfoam
```

Required arguments

None.

Optional arguments

testData A Boolean specifying whether test data are supplied. The default value is OFF.

poisson `None` or a Float specifying the effective Poisson's ratio, ν, of the material. This argument is valid only when *testData*=ON. The default value is `None`.

n An Int specifying the order of the strain energy potential. Possible values are $1 \le n \le 6$. The default value is 1.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

moduli A SymbolicConstant specifying the time-dependence of the material constants. Possible values are INSTANTANEOUS and LONG_TERM. The default value is LONG_TERM.

table A sequence of sequences of Floats specifying the items described below. This argument is valid only when *testData*=OFF. The default value is an empty sequence.

Table data

The items in the table data specify the following for values of n:

- μ_i and α_i for i from 1 to n.
- ν_i.
- Temperature, if the data depend on temperature. Temperature dependence is not allowed for $4 \le n \le 6$ in an Abaqus/Explicit analysis.

Return value

A Hyperfoam object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the Hyperfoam object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Hyperfoam* method.

Return value

`None.`

Exceptions

RangeError.

Members

The Hyperfoam object has members with the same names and descriptions as the arguments to the *Hyperfoam* method.

In addition, the Hyperfoam object can have the following members:

biaxialTestData	A *BiaxialTestData* object.
volumetricTestData	A *VolumetricTestData* object.
planarTestData	A *PlanarTestData* object.
simpleShearTestData	A *SimpleShearTestData* object.
uniaxialTestData	A *UniaxialTestData* object.

Corresponding analysis keywords

- **HYPERFOAM*

Hypoelastic object

The Hypoelastic object specifies hypoelastic material properties.

Access

```
import material
mdb.models[name].materials[name].hypoelastic
import odbMaterial
session.odbs[name].materials[name].hypoelastic
```

Hypoelastic(...)

This method creates a Hypoelastic object.

Path

```
mdb.models[name].materials[name].Hypoelastic
session.odbs[name].materials[name].Hypoelastic
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

user A Boolean specifying that hypoelasticity is defined by user subroutine *UHYPEL*. The default value is OFF.

Table data

- Instantaneous Young's modulus, E.
- Instantaneous Poisson's ratio, ν.
- First strain invariant, I_1.
- Second strain invariant, I_2.
- Third strain invariant, I_3.

Return value

A Hypoelastic object.

Exceptions

None.

setValues(...)

This method modifies the Hypoelastic object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Hypoelastic* method.

Return value

`None.`

Exceptions

None.

Members

The Hypoelastic object has members with the same names and descriptions as the arguments to the *Hypoelastic* method.

Hysteresis object

The Hysteresis object specifies the creep part of the material model for the hysteretic behavior of elastomers.

Access

```
import material
mdb.models[name].materials[name].hyperelastic.hysteresis
import odbMaterial
session.odbs[name].materials[name].hyperelastic.hysteresis
```

Hysteresis(...)

This method creates a Hysteresis object.

Path

```
mdb.models[name].materials[name].hyperelastic.Hysteresis
session.odbs[name].materials[name].hyperelastic.Hysteresis
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

None.

Table data

- Stress scaling factor.
- Creep parameter.
- Effective stress exponent.
- Creep strain exponent.

Return value

A Hysteresis object.

Exceptions

RangeError.

setValues(...)

This method modifies the Hysteresis object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Hysteresis* method.

Return value

`None.`

Exceptions

RangeError.

Members

The Hysteresis object has members with the same names and descriptions as the arguments to the *Hysteresis* method.

Corresponding analysis keywords

InelasticHeatFraction object

The InelasticHeatFraction object defines the fraction of the rate of inelastic dissipation that appears as a heat source.

Access

```
import material
mdb.models[name].materials[name].inelasticHeatFraction
import odbMaterial
session.odbs[name].materials[name].inelasticHeatFraction
```

InelasticHeatFraction(...)

This method creates an InelasticHeatFraction object.

Path

```
mdb.models[name].materials[name].InelasticHeatFraction
session.odbs[name].materials[name].InelasticHeatFraction
```

Required arguments

None.

Optional arguments

fraction A Float specifying the fraction of inelastic dissipation rate that appears as a heat flux per unit volume. The fraction may include a unit conversion factor if required. Possible values are 0.0 ≤*fraction*≤ 1.0. The default value is 0.9.

Return value

An InelasticHeatFraction object.

Exceptions

RangeError.

setValues(...)

This method modifies the InelasticHeatFraction object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *InelasticHeatFraction* method.

Return value

`None.`

Exceptions

RangeError.

Members

The InelasticHeatFraction object has members with the same names and descriptions as the arguments to the *InelasticHeatFraction* method.

Corresponding analysis keywords

- **INELASTIC HEAT FRACTION*

JouleHeatFraction object

The JouleHeatFraction object defines the fraction of electric energy released as heat.

Access

```
import material
mdb.models[name].materials[name].jouleHeatFraction
import odbMaterial
session.odbs[name].materials[name].jouleHeatFraction
```

JouleHeatFraction(...)

This method creates a JouleHeatFraction object.

Path

```
mdb.models[name].materials[name].JouleHeatFraction
session.odbs[name].materials[name].JouleHeatFraction
```

Required arguments

None.

Optional arguments

fraction A Float specifying the fraction of electrical energy released as heat, including any unit conversion factor. The default value is 1.0.

Return value

A JouleHeatFraction object.

Exceptions

RangeError.

setValues(...)

This method modifies the JouleHeatFraction object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *JouleHeatFraction* method.

Return value

`None.`

Exceptions

RangeError.

Members

The JouleHeatFraction object has members with the same names and descriptions as the arguments to the *JouleHeatFraction* method.

Corresponding analysis keywords

- **JOULE HEAT FRACTION*

LatentHeat object

The LatentHeat object specifies a material's latent heat.

Access

```
import material
mdb.models[name].materials[name].latentHeat
import odbMaterial
session.odbs[name].materials[name].latentHeat
```

LatentHeat(...)

This method creates a LatentHeat object.

Path

```
mdb.models[name].materials[name].LatentHeat
session.odbs[name].materials[name].LatentHeat
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

None.

Table data

- Latent heat per unit mass.
- Solidus temperature.
- Liquidus temperature.

Return value

A LatentHeat object.

Exceptions

RangeError.

setValues(...)

This method modifies the LatentHeat object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *LatentHeat* method.

Return value

`None.`

Exceptions

RangeError.

Members

The LatentHeat object has members with the same names and descriptions as the arguments to the *LatentHeat* method.

Corresponding analysis keywords

LowDensityFoam object

The LowDensityFoam object specifies properties for low-density foam.

Access

```
import material
mdb.models[name].materials[name].lowDensityFoam
import odbMaterial
session.odbs[name].materials[name].lowDensityFoam
```

LowDensityFoam(...)

This method creates a LowDensityFoam object.

Path

```
mdb.models[name].materials[name].LowDensityFoam
session.odbs[name].materials[name].LowDensityFoam
```

Required arguments

None.

Optional arguments

elementRemoval A Boolean specifying whether elements are removed if exceeding maximum principal tensile stress. This argument is valid only when *maxAllowablePrincipalStress* is defined. The default value is OFF.

maxAllowablePrincipalStress `None` or a Float specifying the maximum allowable principal tensile stress. The default value is `None`.

extrapolateStressStrainCurve A Boolean specifying whether the stress-strain curve is extrapolated if exceeding maximum strain rate. The default value is OFF.

strainRateType A SymbolicConstant specifying strain rate measure used for constitutive calculations. Possible values are PRINCIPAL and VOLUMETRIC. The default value is VOLUMETRIC.

mu0 A Float specifying the relaxation coefficient μ_0. The default value is 10^{-4}.

mu1 A Float specifying the relaxation coefficient μ_1. The default value is 0.5×10^{-2}.

alpha A Float specifying the relaxation coefficient α. The default value is 2.0.

Return value

A LowDensityFoam object.

Exceptions

RangeError.

setValues(...)

This method modifies the LowDensityFoam object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *LowDensityFoam* method.

Return value

`None.`

Exceptions

RangeError.

Members

The LowDensityFoam object has members with the same names and descriptions as the arguments to the *LowDensityFoam* method.

In addition, the LowDensityFoam object can have the following members:

uniaxialTensionTestData

A *UniaxialTestData* object.

uniaxialCompressionTestData

A *UniaxialTestData* object.

Corresponding analysis keywords

- **LOW DENSITY FOAM*

MagneticPermeability object

The MagneticPermeability object specifies magnetic permeability.

Access

```
import material
mdb.models[name].materials[name].magneticPermeability
import odbMaterial
session.odbs[name].materials[name].magneticPermeability
```

MagneticPermeability(...)

This method creates a MagneticPermeability object.

Path

```
mdb.models[name].materials[name].MagneticPermeability
session.odbs[name].materials[name].MagneticPermeability
```

Required arguments

table
A sequence of sequences of Floats specifying the items described below in "Table data." If *type*=ORTHOTROPIC and nonlinearBH=ON, the data specified in the *table* is for the first direction and *table2* and *table3* must be specified.

table2
A sequence of sequences of Floats specifying the items described below in "Table data" in the second direction. *table2* must be specified only if *type*=ORTHOTROPIC and nonlinearBH=ON.

table3
A sequence of sequences of Floats specifying the items described below in "Table data" in the third direction. *table3* must be specified only if *type*=ORTHOTROPIC and nonlinearBH=ON.

Optional arguments

type
A SymbolicConstant specifying the type of magnetic permeability. Possible values are ISOTROPIC, ORTHOTROPIC, and ANISOTROPIC. The default value is ISOTROPIC.

frequencyDependency
A Boolean specifying whether the data depend on frequency. The default value is OFF.

temperatureDependency
A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of field variable dependencies. The default value is 0.

nonlinearBH
A Boolean specifying whether the magnetic behavior is nonlinear and available in tabular form of magnetic flux density versus magnetic field values. The default value is OFF.

Table data

If *type*=ISOTROPIC, the table data specify the following:

- Magnetic permeability.
- Frequency, if the data depend on frequency.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=ISOTROPIC, and *nonlinearBH*=TRUE, the table data specify the following:

- Magntitude of the magnetic flux density vector.
- Magnitude of the magnetic field vector.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=ORTHOTROPIC, the table data specify the following:

- μ_{11}^{E}.
- μ_{22}^{E}.
- μ_{33}^{E}.
- Frequency, if the data depend on frequency.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=ORTHOTROPIC, and *nonlinearBH*=TRUE, the table data specify the following:

- Magntitude of the magnetic flux density vector in the first direction.
- Magnitude of the magnetic field vector in the second direction.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=ANISOTROPIC, the table data specify the following:

- μ_{11}^{E}.
- μ_{12}^{E}.

- μ_{22}^{E}.
- μ_{13}^{E}.
- μ_{23}^{E}.
- μ_{33}^{E}.
- Frequency, if the data depend on frequency.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A MagneticPermeability object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the MagneticPermeability object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *MagneticPermeability* method.

Return value

`None.`

Exceptions

RangeError.

Members

The MagneticPermeability object has members with the same names and descriptions as the arguments to the *MagneticPermeability* method.

Corresponding analysis keywords

MeanFieldHomogenization object

The MeanFieldHomogenization object specifies the multiscale material definition.

Access

```
import material
mdb.models[name].materials[name].meanFieldHomogenization
import odbMaterial
session.odbs[name].materials[name].meanFieldHomogenization
```

MeanFieldHomogenization(...)

This method creates a MeanFieldHomogenization object.

Path

```
mdb.models[name].materials[name].MeanFieldHomogenization
session.odbs[name].materials[name].MeanFieldHomogenization
```

Required arguments

None.

Optional arguments

angleSubdivision An Int specifying the number of angle increments used for the discretization of the orientation space.

formulation A SymbolicConstant specifying the type of homogenization model. Possible values are MT, REUSS, VOIGT, INVERSED_MT, BALANCED, and UNSPECIFIED. The default value is MT.

isotropization A SymbolicConstant specifying the type of isotropization method. Possible values are ALLISO, EISO, and PISO. The default value is ALLISO.

uniformMatrixStrain A SymbolicConstant specifying whether the average strain in the matrix is uniform across all pseudo-grains. Possible values are NO and YES. The default value is NO.

Return value

A MeanFieldHomogenization object.

Exceptions

RangeError.

setValues(...)

This method modifies the MeanFieldHomogenization object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *MeanFieldHomogenization(...)* method.

Return value

`None.`

Exceptions

RangeError.

Members

The MeanFieldHomogenization object has members with the same names and descriptions as the arguments to the *MeanFieldHomogenization(...)* method.

Corresponding analysis keywords

- **MEAN FIELD HOMOGENIZATION*

MeanFieldInclusion object

The MeanFieldInclusion object specifies the inclusion type multiscale material property.

Access

```
import material
mdb.models[name].materials[name].constituents[name]
import odbMaterial
session.odbs[name].materials[name].constituents[name]
```

MeanFieldInclusion(...)

This method creates a MeanFieldInclusion object.

Path

```
mdb.models[name].materials[name].meanFieldHomogenization.MeanFieldInclusion
session.odbs[name].materials[name].meanFieldHomogenization.MeanFieldInclusion
```

Required arguments

name A String specifying the constituent repository key.

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

material A String specifying the name of the material.

isotropizationCoefficient A Float specifying the factor used for scaling the plastic strain of the constituent when calculating the isotropic part of the tangent.

volumeFractionType A SymbolicConstant specifying the type of volume fraction. Possible values are UNIFORM, ANALYTICAL_FIELD, and DISCRETE_FIELD. The default value is UNIFORM.

volumeFractionFieldName A String specifying the name of the *AnalyticalField* object or *DiscreteField* object.

aspectRatioType A SymbolicConstant specifying the type of aspect ratio. Possible values are UNIFORM, ANALYTICAL_FIELD, and DISCRETE_FIELD. The default value is UNIFORM.

aspectRatioFieldName A String specifying the name of the *AnalyticalField* object or *DiscreteField* object.

orientationTensorType A SymbolicConstant specifying the type of orientation tensor. Possible values are UNIFORM, ANALYTICAL_FIELD, and DISCRETE_FIELD. The default value is UNIFORM.

orientationTensorFieldName	A String specifying the name of the *AnalyticalField* object or *DiscreteField* object.
shape	A SymbolicConstant specifying the type of inclusion shapes. Possible values are SPHERE, PROLATE, OBLATE, CYLINDER, PENNY, and ELLIPTIC_CYLINDER. The default value is SPHERE.
direction	A SymbolicConstant specifying the type of inclusion direction. Possible values are FIXED, RANDOM3D, and ORIENTATION_TENSOR.
strainConcentrationTensor	A sequence of Floats defining the 36 components of the strain concentration tensor.
temperatureGradientConcentrationTensor	A sequence of Floats defining the 9 components of the temperature gradient concentration tensor.

Table data

The table data specify the following:

- Volume fraction.
- Aspect ratio.
- Components of the direction vector defined in the local coordinate system when *direction*=FIXED. Components of the second-order orientation tensor in the local coordinate system when *direction*=ORIENTATION_TENSOR.
- Etc.

Return value

A MeanFieldInclusion object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the MeanFieldInclusion object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *MeanFieldInclusion(...)* method.

Return value

`None.`

Exceptions

RangeError.

session.odbs[name].materials[name].meanFieldHomogenization.MeanFieldVoid
```

Required arguments

name A String specifying the constituent repository key.

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

material A String specifying the name of the material.

isotropizationCoefficient A Float specifying the factor used for scaling the plastic strain of the constituent when calculating the isotropic part of the tangent.

volumeFractionType A SymbolicConstant specifying the type of volume fraction. Possible values are UNIFORM, ANALYTICAL_FIELD, and DISCRETE_FIELD. The default value is UNIFORM.

volumeFractionFieldName A String specifying the name of the *AnalyticalField* object or *DiscreteField* object.

aspectRatioType A SymbolicConstant specifying the type of aspect ratio. Possible values are UNIFORM, ANALYTICAL_FIELD, and DISCRETE_FIELD. The default value is UNIFORM.

aspectRatioFieldName A String specifying the name of the *AnalyticalField* object or *DiscreteField* object.

orientationTensorType A SymbolicConstant specifying the type of orientation tensor. Possible values are UNIFORM, ANALYTICAL_FIELD, and DISCRETE_FIELD. The default value is UNIFORM.

orientationTensorFieldName A String specifying the name of the *AnalyticalField* object or *DiscreteField* object.

shape A SymbolicConstant specifying the type of inclusion shapes. Possible values are SPHERE, PROLATE, OBLATE, CYLINDER, PENNY, and ELLIPTIC_CYLINDER. The default value is SPHERE.

direction A SymbolicConstant specifying the type of inclusion direction. Possible values are FIXED, RANDOM3D, and ORIENTATION_TENSOR.

strainConcentrationTensor A sequence of Floats defining the 36 components of the strain concentration tensor.

temperatureGradientConcentrationTensor A sequence of Floats defining the 9 components of the temperature gradient concentration tensor.

Table data

The table data specify the following:

- Volume fraction.
- Aspect ratio.
- Components of the direction vector defined in the local coordinate system when *direction*=FIXED. Components of the second-order orientation tensor in the local coordinate system when *direction*=ORIENTATION_TENSOR.
- Etc.

Return value

A MeanFieldVoid object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the MeanFieldVoid object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *MeanFieldVoid(...)* method.

Return value

`None.`

Exceptions

RangeError.

Members

The MeanFieldVoid object has members with the same names and descriptions as the arguments to the *MeanFieldVoid(...)* method.

MohrCoulombHardening object

The MohrCoulombHardening object specifies hardening for the Mohr-Coulomb plasticity model.

Access

```
import material
mdb.models[name].materials[name].mohrCoulombPlasticity\
.mohrCoulombHardening
import odbMaterial
session.odbs[name].materials[name].mohrCoulombPlasticity\
.mohrCoulombHardening
```

MohrCoulombHardening(...)

This method creates a MohrCoulombHardening object.

Path

```
mdb.models[name].materials[name].mohrCoulombPlasticity\
.MohrCoulombHardening
session.odbs[name].materials[name].mohrCoulombPlasticity\
.MohrCoulombHardening
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- Cohesion yield stress.
- The absolute value of the corresponding plastic strain.(The first tabular value entered must always be zero.)
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A MohrCoulombHardening object.

Exceptions

RangeError.

setValues(...)

This method modifies the MohrCoulombHardening object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *MohrCoulombHardening* method.

Return value

`None.`

Exceptions

RangeError.

Members

The MohrCoulombHardening object has members with the same names and descriptions as the arguments to the *MohrCoulombHardening* method.

Corresponding analysis keywords

MohrCoulombPlasticity object

The MohrCoulombPlasticity object specifies the extended Mohr-Coulomb plasticity model.

Access

```
import material
mdb.models[name].materials[name].mohrCoulombPlasticity
import odbMaterial
session.odbs[name].materials[name].mohrCoulombPlasticity
```

MohrCoulombPlasticity(...)

This method creates a MohrCoulombPlasticity object.

Path

```
mdb.models[name].materials[name].MohrCoulombPlasticity
session.odbs[name].materials[name].MohrCoulombPlasticity
```

Required arguments

table
A sequence of sequences of Floats specifying the items described below.

Optional arguments

deviatoricEccentricity
`None` or a Float specifying the flow potential eccentricity in the deviatoric plane, e; $1/2 \leq e \leq 1.0$. If *deviatoricEccentricity*=`None`, Abaqus calculates the value using the specified Mohr-Coulomb angle of friction. The default value is `None`.

meridionalEccentricity
A Float specifying the flow potential eccentricity in the meridional plane, ϵ. The default value is 0.1.

temperatureDependency
A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of field variable dependencies. The default value is 0.

useTensionCutoff
A Boolean specifying whether tension cutoff specification is needed. The default value is OFF.

Table data

The table data specify the following:

- Friction angle (given in degrees), ϕ, at high confining pressure in the p–$R_{mc}q$ plane.
- Dilation angle, ψ, at high confining pressure in the p–$R_{mw}q$ plane.
- Temperature, if the data depend on temperature.

- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A MohrCoulombPlasticity object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the MohrCoulombPlasticity object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *MohrCoulombPlasticity* method.

Return value

`None.`

Exceptions

RangeError.

Members

The MohrCoulombPlasticity object has members with the same names and descriptions as the arguments to the *MohrCoulombPlasticity* method.

In addition, the MohrCoulombPlasticity object can have the following members:

mohrCoulombHardening	A *MohrCoulombHardening* object.
tensionCutOff	A *TensionCutOff* object.

Corresponding analysis keywords

MoistureSwelling object

The MoistureSwelling object defines moisture-driven swelling.

Access

```
import material
mdb.models[name].materials[name].moistureSwelling
import odbMaterial
session.odbs[name].materials[name].moistureSwelling
```

MoistureSwelling(...)

This method creates a MoistureSwelling object.

Path

```
mdb.models[name].materials[name].MoistureSwelling
session.odbs[name].materials[name].MoistureSwelling
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

None.

Table data

- Volumetric moisture swelling strain, ε^{ms}.
- Saturation, s. This value must lie in the range $0.0 \le s \le 1.0$.

Return value

A MoistureSwelling object.

Exceptions

None.

setValues(...)

This method modifies the MoistureSwelling object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *MoistureSwelling* method.

Return value
`None.`

Exceptions
None.

Members
The MoistureSwelling object has members with the same names and descriptions as the arguments to the *MoistureSwelling* method.

In addition, the MoistureSwelling object can have the following member:

ratios
A *Ratios* object.

Corresponding analysis keywords
- **MOISTURE SWELLING*

MullinsEffect object

The MullinsEffect specifies properties for mullins data.

Access

```
import material
mdb.models[name].materials[name].mullinsEffect
import odbMaterial
session.odbs[name].materials[name].mullinsEffect
```

Members

The MullinsEffect object can have the following members:

definition

A SymbolicConstant specifying the method of specifying the data. Possible values are USER, CONSTANTS, and TEST_DATA. The default value is CONSTANTS.

temperatureDependency

A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies

An Int specifying the number of field variable dependencies. The default value is 0.

properties

An Int specifying the number of property values needed as data for the user-defined hyperelastic material. The default value is 0.

table

A tuple of tuples of Floats specifying the items described below. The default value is an empty sequence.

uniaxialTests

A *UniaxialTestDataArray* object.

biaxialTests

A *BiaxialTestDataArray* object.

planarTests

A *PlanarTestDataArray* object.

Ornl object

The Ornl object specifies the constitutive model developed by Oak Ridge National Laboratory.

Access

```
import material
mdb.models[name].materials[name].creep.ornl
mdb.models[name].materials[name].plastic.ornl
import odbMaterial
session.odbs[name].materials[name].creep.ornl
session.odbs[name].materials[name].plastic.ornl
```

Ornl(...)

This method creates an Ornl object.

Path

```
mdb.models[name].materials[name].creep.Ornl
mdb.models[name].materials[name].plastic.Ornl
session.odbs[name].materials[name].creep.Ornl
session.odbs[name].materials[name].plastic.Ornl
```

Required arguments

None.

Optional arguments

a
A Float specifying the saturation rates for kinematic shift caused by creep strain, as defined by Equation (15) of Section 4.3.3–3 of the Nuclear Standard. The default value corresponds to that section of the Standard. Set *a*=0.0 to use the 1986 revision of the Standard. The default value is 0.3.

h
`None` or a Float specifying the rate of kinematic shift with respect to creep strain [Equation (7) of Section 4.3.2–1 of the Nuclear Standard]. If *h*=`None`, the value of *h* is determined according to Section 4.3.3–3 of the 1981 revision of the Standard. Set *h*=0.0 to use the 1986 revision of the Standard. The default value is `None`.

reset
A Boolean specifying whether to invoke the optional α reset procedure described in Section 4.3.5 of the Nuclear Standard. The default value is OFF.

Return value

An Ornl object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the Ornl object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Ornl* method.

Return value

`None.`

Exceptions

RangeError.

Members

The Ornl object has members with the same names and descriptions as the arguments to the *Ornl* method.

Corresponding analysis keywords

- **ORNL*

Permeability object

The Permeability object defines permeability for pore fluid flow.

Access

```
import material
mdb.models[name].materials[name].permeability
import odbMaterial
session.odbs[name].materials[name].permeability
```

Permeability(...)

This method creates a Permeability object.

Path

```
mdb.models[name].materials[name].Permeability
session.odbs[name].materials[name].Permeability
```

Required arguments

specificWeight
A Float specifying the specific weight of the wetting liquid, γ_w.

inertialDragCoefficient
A Float specifying The inertial drag coefficient of the wetting liquid, γ_w.

table
A sequence of sequences of Floats specifying the items described below.

Optional arguments

type
A SymbolicConstant specifying the type of permeability. Possible values are ISOTROPIC, ORTHOTROPIC, and ANISOTROPIC. The default value is ISOTROPIC.

temperatureDependency
A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of field variable dependencies. The default value is 0.

Table data

If *type*=ISOTROPIC, the table data specify the following:

- k.
- Void ratio, e.
- Temperature, if the data depend on temperature.

If *type*=ORTHOTROPIC, the table data specify the following:

- k_{11}.

- k_{22}.
- k_{33}.
- Void ratio, e.
- Temperature, if the data depend on temperature.

If *type*=ANISOTROPIC, the table data specify the following:

- k_{11}.
- k_{12}.
- k_{22}.
- k_{13}.
- k_{23}.
- k_{33}.
- Void ratio, e.
- Temperature, if the data depend on temperature.

Return value

A Permeability object.

Exceptions

RangeError.

setValues(...)

This method modifies the Permeability object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Permeability* method.

Return value

`None.`

Exceptions

RangeError.

Members

The Permeability object has members with the same names and descriptions as the arguments to the *Permeability* method.

In addition, the Permeability object can have the following members:

saturationDependence
A *SaturationDependence* object specifying the dependence of the permeability of a material on the saturation of the wetting liquid.

velocityDependence
A *VelocityDependence* object specifying the dependence of the permeability of a material on the velocity of fluid flow.

Corresponding analysis keywords

- **PERMEABILITY*

Piezoelectric object

The Piezoelectric object specifies piezoelectric material properties.

Access

```
import material
mdb.models[name].materials[name].piezoelectric
import odbMaterial
session.odbs[name].materials[name].piezoelectric
```

Piezoelectric(...)

This method creates a Piezoelectric object.

Path

```
mdb.models[name].materials[name].Piezoelectric
session.odbs[name].materials[name].Piezoelectric
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

type A SymbolicConstant specifying the type of material coefficients for the piezoelectric property. Possible values are STRAIN and STRESS. The default value is STRESS.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

If *type*=STRESS, the table data specify the following:

- $e^{\varphi}_{1\,11}$.
- $e^{\varphi}_{1\,22}$.
- $e^{\varphi}_{1\,33}$.
- $e^{\varphi}_{1\,12}$.
- $e^{\varphi}_{1\,13}$.
- $e^{\varphi}_{1\,23}$.
- $e^{\varphi}_{2\,11}$.

- $e^{\varphi}_{2\,22}$.
- $e^{\varphi}_{2\,33}$.
- $e^{\varphi}_{2\,12}$.
- $e^{\varphi}_{2\,13}$.
- $e^{\varphi}_{2\,23}$.
- $e^{\varphi}_{3\,11}$.
- $e^{\varphi}_{3\,22}$.
- $e^{\varphi}_{3\,33}$.
- $e^{\varphi}_{3\,12}$.
- $e^{\varphi}_{3\,13}$.
- $e^{\varphi}_{3\,23}$.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=STRAIN, the table data specify the following:

- $d^{\varphi}_{1\,11}$.
- $d^{\varphi}_{1\,22}$.
- $d^{\varphi}_{1\,33}$.
- $d^{\varphi}_{1\,12}$.
- $d^{\varphi}_{1\,13}$.
- $d^{\varphi}_{1\,23}$.
- $d^{\varphi}_{2\,11}$.
- $d^{\varphi}_{2\,22}$.
- $d^{\varphi}_{2\,33}$.
- $d^{\varphi}_{2\,12}$.
- $d^{\varphi}_{2\,13}$.
- $d^{\varphi}_{2\,23}$.
- $d^{\varphi}_{3\,11}$.

- $d^{\varphi}_{3\,22}$.
- $d^{\varphi}_{3\,33}$.
- $d^{\varphi}_{3\,13}$.
- $d^{\varphi}_{3\,23}$.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A Piezoelectric object.

Exceptions

None.

setValues(...)

This method modifies the Piezoelectric object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Piezoelectric* method.

Return value

`None.`

Exceptions

None.

Members

The Piezoelectric object has members with the same names and descriptions as the arguments to the *Piezoelectric* method.

Corresponding analysis keywords

- **PIEZOELECTRIC*

PlanarTestData object

The PlanarTestData object specifies planar test (or pure shear) data (compression and/or tension).

Access

```
import material
mdb.models[name].materials[name].hyperelastic.planarTestData
mdb.models[name].materials[name].hyperfoam.planarTestData
mdb.models[name].materials[name].mullinsEffect.planarTests[i]
import odbMaterial
session.odbs[name].materials[name].hyperelastic.planarTestData
session.odbs[name].materials[name].hyperfoam.planarTestData
session.odbs[name].materials[name].mullinsEffect.planarTests[i]
```

PlanarTestData(...)

This method creates a PlanarTestData object.

Path

```
mdb.models[name].materials[name].hyperelastic.PlanarTestData
mdb.models[name].materials[name].hyperfoam.PlanarTestData
mdb.models[name].materials[name].mullinsEffect.PlanarTestData
session.odbs[name].materials[name].hyperelastic.PlanarTestData
session.odbs[name].materials[name].hyperfoam.PlanarTestData
session.odbs[name].materials[name].mullinsEffect.PlanarTestData
```

Required arguments

table
A sequence of sequences of Floats specifying the items described below.

Optional arguments

smoothing
`None` or an Int specifying the value for smoothing. If *smoothing*=`None`, no smoothing is employed. The default value is `None`.

lateralNominalStrain
A Boolean specifying whether to include lateral nominal strain. The default value is OFF.

temperatureDependency
A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of field variable dependencies. The default value is 0.

Table data

For a hyperelastic material model, the table data specify the following:

- Nominal stress, T_S.

- Nominal strain in the direction of loading, ϵ_S.

For a hyperfoam material model, the table data specify the following:

- Nominal stress, T_L.
- Nominal strain in the direction of loading, ϵ_p.
- Nominal transverse strain, ϵ_3. The default value is 0.

Return value

A PlanarTestData object.

Exceptions

None.

setValues(...)

This method modifies the PlanarTestData object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *PlanarTestData* method.

Return value

`None.`

Exceptions

None.

Members

The PlanarTestData object has members with the same names and descriptions as the arguments to the *PlanarTestData* method.

Corresponding analysis keywords

- **PLANAR TEST DATA*

Plastic object

The Plastic object specifies a metal plasticity model.

Access

```
import material
mdb.models[name].materials[name].plastic
import odbMaterial
session.odbs[name].materials[name].plastic
```

Plastic(...)

This method creates a Plastic object.

Path

```
mdb.models[name].materials[name].Plastic
session.odbs[name].materials[name].Plastic
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

hardening A SymbolicConstant specifying the type of hardening. Possible values are ISOTROPIC, KINEMATIC, COMBINED, JOHNSON_COOK, and USER. The default value is ISOTROPIC.

rate A Boolean specifying whether the data depend on rate. The default value is OFF.

dataType A SymbolicConstant specifying the type of combined hardening. This argument is only valid if *hardening*=COMBINED. Possible values are HALF_CYCLE, PARAMETERS, and STABILIZED. The default value is HALF_CYCLE.

strainRangeDependency A Boolean specifying whether the data depend on strain range. This argument is only valid if *hardening*=COMBINED and *dataType*=STABILIZED. The default value is OFF.

numBackstresses An Int specifying the number of backstresses. This argument is only valid if *hardening*=COMBINED. The default value is 1.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

extrapolation A SymbolicConstant specifying the extrapolation method for the yield stress with respect to the equivalent plastic strain. This argument is valid only if *hardening*=ISOTROPIC. Possible values are CONSTANT and LINEAR . The default value is CONSTANT.

Table data

If *hardening*=ISOTROPIC, or if *hardening*=COMBINED and *dataType*=HALF_CYCLE, the table data specify the following:

- Yield stress.
- Plastic strain.
- Equivalent plastic strain rate, $\dot{\bar{\varepsilon}}^{pl}$.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *hardening*=COMBINED and *dataType*=STABILIZED, the table data specify the following:

- Yield stress.
- Plastic strain.
- Strain range, if the data depend on strain range.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *hardening*=COMBINED and *dataType*=PARAMETERS, the table data specify the following:

- Yield stress at zero plastic strain.
- The first kinematic hardening parameter, C_1.
- The first kinematic hardening parameter, γ_1.
- If applicable, the second kinematic hardening parameter, C_2.
- If applicable, the second kinematic hardening parameter, γ_2.
- Etc.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *hardening*=KINEMATIC, the table data specify the following:

- Yield stress.
- Plastic strain.
- Temperature, if the data depend on temperature.

If *hardening*=JOHNSON_COOK, the table data specify the following:

- A.
- B.

- n.
- m.
- Melting temperature.
- Transition temperature.

If *hardening*=USER, the table data specify the following:

- Hardening properties.

Return value

A Plastic object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the Plastic object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Plastic* method.

Return value

`None.`

Exceptions

RangeError.

Members

The Plastic object has members with the same names and descriptions as the arguments to the *Plastic* method.

In addition, the Plastic object can have the following members:

rateDependent A *RateDependent* object.

potential A *Potential* object.

cyclicHardening A *CyclicHardening* object.

ornl An *Ornl* object.

cycledPlastic A *CycledPlastic* object.

annealTemperature An *AnnealTemperature* object.

tensileFailure A *TensileFailure* object.

PlasticityCorrection object

The PlasticityCorrection object specifies the elastic-plastic response of the material with linear elasticity.

Access

```
import material
mdb.models[name].materials[name].plasticityCorrection
```

PlasticityCorrection(...)

This method creates a PlasticityCorrection object.

Path

```
mdb.models[name].materials[name].PlasticityCorrection
```

Required arguments

type
Set type=RAMBERG_OSGOOD to specify the Ramberg-Osgood relationship.

Set type=TABULAR to specify the tabular form.

table
A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency
A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of field variable dependencies. The default value is 0.

Table data

If *type*=RAMBERG_OSGOOD, the table specifies the following:

- K.
- n.
- Temperature if the data depend on temperature.
- Value of the first field variable if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=TABULAR, the table specifies the following:

- Yield stress.
- Plastic strain.
- Temperature if the data depend on temperature.

- Value of the first field variable if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A PlasticityCorrection object.

Exceptions

None.

`setValues(...)`

This method modifies the PlasticityCorrection object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *PlasticityCorrection* method.

Return value

`None.`

Exceptions

None.

Members

The PlasticityCorrection object has members with the same names and descriptions as the arguments to the *PlasticityCorrection* method.

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

zero A Float specifying the value of θ^0. The default value is 0.0.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- Mean coefficient of thermal expansion, α.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A PoreFluidExpansion object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the PoreFluidExpansion object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *PoreFluidExpansion* method.

Return value

`None.`

Exceptions

RangeError.

Members

The PoreFluidExpansion object has members with the same names and descriptions as the arguments to the *PoreFluidExpansion* method.

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

Table data

- Bulk modulus of solid grains.
- Bulk modulus of permeating fluid.
- Temperature, if the data depend on temperature.

Return value

A PorousBulkModuli object.

Exceptions

None.

setValues(...)

This method modifies the PorousBulkModuli object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *PorousBulkModuli* method.

Return value

`None.`

Exceptions

None.

Members

The PorousBulkModuli object has members with the same names and descriptions as the arguments to the *PorousBulkModuli* method.

session.odbs[name].materials[name].PorousElastic
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

shear A SymbolicConstant specifying the shear definition form. Possible values are G and POISSON. The default value is POISSON.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

If *shear*=G, the table data specify the following:

- The logarithmic bulk modulus, κ. (Dimensionless.)
- The shear modulus, G.
- The elastic tensile limit, p_t^{el}. (This value cannot be negative.)
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *shear*=POISSON, the table data specify the following:

- The logarithmic bulk modulus, κ. (Dimensionless.)

- The Poisson's ratio, ν.
- The elastic tensile limit, p_t^{el}. (This value cannot be negative.)
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A PorousElastic object.

Exceptions

RangeError.

setValues(...)

This method modifies the PorousElastic object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *PorousElastic* method.

Return value

`None.`

Exceptions

RangeError.

Members

The PorousElastic object has members with the same names and descriptions as the arguments to the *PorousElastic* method.

Required arguments

None.

Optional arguments

fraction

A Float specifying the void volume fraction at total failure, $f_F > 0$. The default value is 1.0.

criticalFraction

A Float specifying the critical void volume fraction, $f_c \geq 0$. The default value is 1.0.

Return value

A PorousFailureCriteria object.

Exceptions

RangeError.

setValues(...)

This method modifies the PorousFailureCriteria object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *PorousFailureCriteria* method.

Return value

`None.`

Exceptions

RangeError.

Members

The PorousFailureCriteria object has members with the same names and descriptions as the arguments to the *PorousFailureCriteria* method.

Corresponding analysis keywords

- **POROUS FAILURE CRITERIA*

PorousMetalPlasticity object

The PorousMetalPlasticity object specifies a porous metal plasticity model.

Access

```
import material
mdb.models[name].materials[name].porousMetalPlasticity
import odbMaterial
session.odbs[name].materials[name].porousMetalPlasticity
```

PorousMetalPlasticity(...)

This method creates a PorousMetalPlasticity object.

Path

```
mdb.models[name].materials[name].PorousMetalPlasticity
session.odbs[name].materials[name].PorousMetalPlasticity
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

relativeDensity `None` or a Float specifying the initial relative density of the material, r_0. The default value is `None`.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- q_1.
- q_2.
- q_3.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A PorousMetalPlasticity object.

Exceptions

RangeError.

setValues(...)

This method modifies the PorousMetalPlasticity object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *PorousMetalPlasticity* method.

Return value

`None.`

Exceptions

RangeError.

Members

The PorousMetalPlasticity object has members with the same names and descriptions as the arguments to the *PorousMetalPlasticity* method.

In addition, the PorousMetalPlasticity object can have the following members:

porousFailureCriteria
A *PorousFailureCriteria* object.

voidNucleation
A *VoidNucleation* object.

Corresponding analysis keywords

- **POROUS METAL PLASTICITY*

Potential object

The Potential object defines an anisotropic yield/creep model.

Access

```
import material
mdb.models[name].materials[name].creep.potential
mdb.models[name].materials[name].plastic.potential
mdb.models[name].materials[name].viscous.potential
import odbMaterial
session.odbs[name].materials[name].creep.potential
session.odbs[name].materials[name].plastic.potential
session.odbs[name].materials[name].viscous.potential
```

Potential(...)

This method creates a Potential object.

Path

```
mdb.models[name].materials[name].creep.Potential
mdb.models[name].materials[name].plastic.Potential
mdb.models[name].materials[name].viscous.Potential
session.odbs[name].materials[name].creep.Potential
session.odbs[name].materials[name].plastic.Potential
session.odbs[name].materials[name].viscous.Potential
```

Required arguments

table
A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency
A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- R_{11}.
- R_{22}.
- R_{33}.
- R_{12}.
- R_{13}.
- R_{23}.

- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A Potential object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the Potential object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Potential* method.

Return value

`None.`

Exceptions

RangeError.

Members

The Potential object has members with the same names and descriptions as the arguments to the *Potential* method.

Corresponding analysis keywords

- **POTENTIAL*

PressureEffect object

The PressureEffect object defines equivalent pressure stress driven mass diffusion.

Access

```
import material
mdb.models[name].materials[name].diffusivity.pressureEffect
import odbMaterial
session.odbs[name].materials[name].diffusivity.pressureEffect
```

PressureEffect(...)

This method creates a PressureEffect object.

Path

```
mdb.models[name].materials[name].diffusivity.PressureEffect
session.odbs[name].materials[name].diffusivity.PressureEffect
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- Pressure stress factor, κ_p.
- Concentration.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A PressureEffect object.

Exceptions

RangeError.

setValues(...)

This method modifies the PressureEffect object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *PressureEffect* method.

Return value

`None.`

Exceptions

RangeError.

Members

The PressureEffect object has members with the same names and descriptions as the arguments to the *PressureEffect* method.

Corresponding analysis keywords

- **KAPPA*

RateDependent object

The RateDependent object defines a rate-dependent viscoplastic model.

Access

```
import material
mdb.models[name].materials[name].crushableFoam.rateDependent
mdb.models[name].materials[name].druckerPrager.rateDependent
mdb.models[name].materials[name].plastic.rateDependent
import odbMaterial
session.odbs[name].materials[name].crushableFoam.rateDependent
session.odbs[name].materials[name].druckerPrager.rateDependent
session.odbs[name].materials[name].plastic.rateDependent
```

RateDependent(...)

This method creates a RateDependent object.

Path

```
mdb.models[name].materials[name].crushableFoam.RateDependent
mdb.models[name].materials[name].druckerPrager.RateDependent
mdb.models[name].materials[name].plastic.RateDependent
session.odbs[name].materials[name].crushableFoam.RateDependent
session.odbs[name].materials[name].druckerPrager.RateDependent
session.odbs[name].materials[name].plastic.RateDependent
```

Required arguments

table
A sequence of sequences of Floats specifying the items described below.

Optional arguments

type
A SymbolicConstant specifying the type of rate-dependent data. Possible values are POWER_LAW, YIELD_RATIO, and JOHNSON_COOK. The default value is POWER_LAW.

temperatureDependency
A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of field variable dependencies. The default value is 0.

Table data

If *type*=POWER_LAW, the table data specify the following:

- D.
- n.
- Temperature, if the data depend on temperature.

- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=YIELD_RATIO, the table data specify the following:

- Yield stress ratio, $R = \overline{\sigma}/\sigma^0$.
- Equivalent plastic strain rate, $\dot{\bar{\varepsilon}}^{pl}$.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=JOHNSON_COOK, the table data specify the following:

- C.
- $\dot{\varepsilon}_0$.

Return value

A RateDependent object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the RateDependent object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *RateDependent* method.

Return value

`None.`

Exceptions

RangeError.

Members

The RateDependent object has members with the same names and descriptions as the arguments to the *RateDependent* method.

Corresponding analysis keywords

- **RATE DEPENDENT*

Ratios object

The Ratios object specifies ratios that define anisotropic swelling.

Access

```
import material
mdb.models[name].materials[name].moistureSwelling.ratios
mdb.models[name].materials[name].swelling.ratios
import odbMaterial
session.odbs[name].materials[name].moistureSwelling.ratios
session.odbs[name].materials[name].swelling.ratios
```

Ratios(...)

This method creates a Ratios object.

Path

```
mdb.models[name].materials[name].moistureSwelling.Ratios
mdb.models[name].materials[name].swelling.Ratios
session.odbs[name].materials[name].moistureSwelling.Ratios
session.odbs[name].materials[name].swelling.Ratios
```

Required arguments

table
A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency
A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- r_{11}.
- r_{22}.
- r_{33}.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A Ratios object.

Exceptions

RangeError.

setValues(...)

This method modifies the Ratios object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Ratios* method.

Return value

`None.`

Exceptions

RangeError.

Members

The Ratios object has members with the same names and descriptions as the arguments to the *Ratios* method.

Corresponding analysis keywords

- **RATIOS*

Regularization object

The Regularization object defines the tolerance to be used for regularizing material data.

Access

```
import material
mdb.models[name].materials[name].regularization
import odbMaterial
session.odbs[name].materials[name].regularization
```

Regularization(...)

This method creates a Regularization object.

Path

```
mdb.models[name].materials[name].Regularization
session.odbs[name].materials[name].Regularization
```

Required arguments

None.

Optional arguments

rtol A Float specifying the tolerance to be used for regularizing material data. The default value is 0.03.

strainRateRegularization A SymbolicConstant specifying the form of regularization of strain-rate-dependent material data. Possible values are LOGARITHMIC and LINEAR. The default value is LOGARITHMIC.

Return value

A Regularization object.

Exceptions

RangeError.

setValues(...)

This method modifies the Regularization object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Regularization* method.

Return value

`None.`

Exceptions

RangeError.

Members

The Regularization object has members with the same names and descriptions as the arguments to the *Regularization* method.

Corresponding analysis keywords

- **DASHPOT*

SaturationDependence object

The SaturationDependence object specifies the dependence of the permeability of a material on the saturation of the wetting liquid.

Access

```
import material
mdb.models[name].materials[name].permeability.saturationDependence
import odbMaterial
session.odbs[name].materials[name].permeability.saturationDependence
```

SaturationDependence(...)

This method creates a SaturationDependence object.

Path

```
mdb.models[name].materials[name].permeability.SaturationDependence
session.odbs[name].materials[name].permeability.SaturationDependence
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

None.

Table data

- k_s. (Dimensionless.)
- Saturation, s. (Dimensionless.)

Return value

A SaturationDependence object.

Exceptions

RangeError.

setValues(...)

This method modifies the SaturationDependence object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *SaturationDependence* method.

Return value

`None.`

Exceptions

RangeError.

Members

The SaturationDependence object has members with the same names and descriptions as the arguments to the *SaturationDependence* method.

Corresponding analysis keywords

- **PERMEABILITY*

ShearRetention object

The ShearRetention object defines the reduction of the shear modulus associated with crack surfaces in a *Concrete* model as a function of the tensile strain across the crack.

Access

```
import material
mdb.models[name].materials[name].concrete.shearRetention
import odbMaterial
session.odbs[name].materials[name].concrete.shearRetention
```

ShearRetention(...)

This method creates a ShearRetention object.

Path

```
mdb.models[name].materials[name].concrete.ShearRetention
session.odbs[name].materials[name].concrete.ShearRetention
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- ϱ^{close} for dry concrete. The default value is 1.0.
- ε^{max} for dry concrete. The default value is a very large number (full shear retention).
- ϱ^{close} for wet concrete. The default value is 1.0.
- ε^{max} for wet concrete. The default value is a very large number (full shear retention).
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A ShearRetention object.

Exceptions

RangeError.

setValues(...)

This method modifies the ShearRetention object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ShearRetention* method.

Return value

`None.`

Exceptions

RangeError.

Members

The ShearRetention object has members with the same names and descriptions as the arguments to the *ShearRetention* method.

Corresponding analysis keywords

- **SHEAR RETENTION*

ShearTestData object

The ShearTestData object specifies the normalized shear creep compliance or relaxation modulus as a function of time.

Access

```
import material
mdb.models[name].materials[name].viscoelastic.shearTestData
import odbMaterial
session.odbs[name].materials[name].viscoelastic.shearTestData
```

ShearTestData(...)

This method creates a ShearTestData object.

Path

```
mdb.models[name].materials[name].viscoelastic.ShearTestData
session.odbs[name].materials[name].viscoelastic.ShearTestData
```

Required arguments

table

A sequence of sequences of Floats specifying values that depend on the *time* member of the *Viscoelastic* object.

If *time*=RELAXATION_TEST_DATA, the table data specify the following:

- Normalized shear relaxation modulus $g_R(t)$. $(0 \le g_R(t) \le 1)$.
- Time t. $(t > 0)$.

If *time*=CREEP_TEST_DATA, the table data specify the following:

- Normalized shear compliance $j_S(t)$. $(j_S(t) \ge 1)$.
- Time t. $(t > 0)$.

Optional arguments

shrinf

`None` or a Float specifying a normalized shear. The value of *shrinf* depends on the value of the *time* member of the *Viscoelastic* object. The default value is `None`.

If *time*=RELAXATION_TEST_DATA, *shrinf* specifies the value of the long-term, normalized shear modulus $g_R(\infty)$.

If *time*=CREEP_TEST_DATA, *shrinf* specifies the value of the long-term, normalized shear compliance $j_S(\infty)$.

Return value

A ShearTestData object.

Exceptions

None.

setValues(...)

This method modifies the ShearTestData object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *ShearTestData* method.

Return value

`None.`

Exceptions

None.

Members

The ShearTestData object has members with the same names and descriptions as the arguments to the *ShearTestData* method.

Corresponding analysis keywords

- **SHEAR TEST DATA*

SimpleShearTestData object

The SimpleShearTestData object provides simple shear test data.

Access

```
import material
mdb.models[name].materials[name].hyperfoam.simpleShearTestData
import odbMaterial
session.odbs[name].materials[name].hyperfoam.simpleShearTestData
```

SimpleShearTestData(...)

This method creates a SimpleShearTestData object.

Path

```
mdb.models[name].materials[name].hyperfoam.SimpleShearTestData
session.odbs[name].materials[name].hyperfoam.SimpleShearTestData
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

None.

Table data

- Nominal shear stress, T_S.
- Nominal shear strain, γ.
- Nominal transverse stress, T_T (normal to edge with shear stress). This stress value is optional.

Return value

A SimpleShearTestData object.

Exceptions

None.

setValues(...)

This method modifies the SimpleShearTestData object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *SimpleShearTestData* method.

Return value

`None.`

Exceptions

None.

Members

The SimpleShearTestData object has members with the same names and descriptions as the arguments to the *SimpleShearTestData* method.

Corresponding analysis keywords

- **SIMPLE SHEAR TEST DATA*

Solubility object

The Solubility object specifies solubility.

Access

```
import material
mdb.models[name].materials[name].solubility
import odbMaterial
session.odbs[name].materials[name].solubility
```

Solubility(...)

This method creates a Solubility object.

Path

```
mdb.models[name].materials[name].Solubility
session.odbs[name].materials[name].Solubility
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- Solubility.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A Solubility object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the Solubility object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Solubility* method.

Return value

`None.`

Exceptions

RangeError.

Members

The Solubility object has members with the same names and descriptions as the arguments to the *Solubility* method.

Corresponding analysis keywords

SoretEffect object

The SoretEffect object defines temperature gradient driven mass diffusion.

Access

```
import material
mdb.models[name].materials[name].diffusivity.soretEffect
import odbMaterial
session.odbs[name].materials[name].diffusivity.soretEffect
```

SoretEffect(...)

This method creates a SoretEffect object.

Path

```
mdb.models[name].materials[name].diffusivity.SoretEffect
session.odbs[name].materials[name].diffusivity.SoretEffect
```

Required arguments

table
A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency
A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- Soret effect factor, κ_s.
- Concentration.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A SoretEffect object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the SoretEffect object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *SoretEffect* method.

Return value

`None.`

Exceptions

RangeError.

Members

The SoretEffect object has members with the same names and descriptions as the arguments to the *SoretEffect* method.

Corresponding analysis keywords

- **KAPPA*

Sorption object

The Sorption object defines absorption and exsorption behaviors of a partially saturated porous medium in the analysis of coupled wetting liquid flow and porous medium stress.

Access

```
import material
mdb.models[name].materials[name].sorption
import odbMaterial
session.odbs[name].materials[name].sorption
```

Sorption(...)

This method creates a Sorption object.

Path

```
mdb.models[name].materials[name].Sorption
session.odbs[name].materials[name].Sorption
```

Required arguments

absorptionTable A sequence of sequences of Floats specifying the items described below.

Optional arguments

lawAbsorption A SymbolicConstant specifying absorption behavior. Possible values are LOG and TABULAR. The default value is TABULAR.

exsorption A Boolean specifying whether the exsorption data is specified. The default value is OFF.

lawExsorption A SymbolicConstant specifying exsorption behavior. Possible values are LOG and TABULAR. The default value is TABULAR.

scanning A Float specifying the slope of the scanning line, $(du_w/ds)|_s$. This slope must be positive and larger than the slope of the absorption or exsorption behaviors. The default value is 0.0.

exsorptionTable A sequence of sequences of Floats specifying the items described below. The default value is an empty sequence.

Table data

If *lawAbsorption*=TABULAR or *lawExsorption*=TABULAR, the *absorptionTable* and *exsorptionTable* data respectively specify the following:

- Pore pressure, u_w.
- Saturation, s.

If *lawAbsorption*=LOG or *lawExsorption*=LOG, the *absorptionTable* and *exsorptionTable* data respectively specify the following:

- A.
- B.
- s_0.
- s_1.

Return value

A Sorption object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the Sorption object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Sorption* method.

Return value

`None.`

Exceptions

RangeError.

Members

The Sorption object has members with the same names and descriptions as the arguments to the *Sorption* method.

Corresponding analysis keywords

- **SORPTION*

SpecificHeat object

The SpecificHeat object specifies a material's specific heat.

Access

```
import material
mdb.models[name].materials[name].specificHeat
import odbMaterial
session.odbs[name].materials[name].specificHeat
```

SpecificHeat(...)

This method creates a SpecificHeat object.

Path

```
mdb.models[name].materials[name].SpecificHeat
session.odbs[name].materials[name].SpecificHeat
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

law A SymbolicConstant specifying the specific heat behavior. Possible values are CONSTANTVOLUME and CONSTANTPRESSURE. The default value is CONSTANTVOLUME.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- Specific heat per unit mass.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A SpecificHeat object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the SpecificHeat object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *SpecificHeat* method.

Return value

`None.`

Exceptions

RangeError.

Members

The SpecificHeat object has members with the same names and descriptions as the arguments to the *SpecificHeat* method.

Corresponding analysis keywords

SuperElasticHardening object

The SuperElasticHardening object specifies the dependence of the yield stress on the total strain to define the piecewise linear hardening of a martensite material model.

Access

```
import material
mdb.models[name].materials[name].superElasticity.SuperElasticHardening
import odbMaterial
session.odbs[name].materials[name].superElasticity.SuperElasticHardening
```

SuperElasticHardening(...)

This method creates a SuperElasticHardening object.

Path

```
mdb.models[name].materials[name].superElasticity.SuperElasticHardening
session.odbs[name].materials[name].superElasticity.SuperElasticHardening
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Table data

- Yield Stress.
- Total Strain.

Return value

A SuperElasticHardening object.

Exceptions

RangeError.

setValues(...)

This method modifies the SuperElasticHardening object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *SuperElasticHardening* method.

Return value

`None.`

Exceptions

RangeError.

Members

The SuperElasticHardening object has members with the same names and descriptions as the arguments to the *SuperElasticHardening* method.

Corresponding analysis keywords

- **SUPERELASTIC HARDENING*

SuperElasticHardeningModifications object

The SuperElasticHardeningModifications object specifies the variation of the transformation stress levels of a material model.

Access

```
import material
mdb.models[name].materials[name].superElasticity.SuperElasticHardening
import odbMaterial
session.odbs[name].materials[name].superElasticity.SuperElasticHardening
```

SuperElasticHardeningModifications(...)

This method creates a SuperElasticHardeningModifications object.

Path

```
mdb.models[name].materials[name].superElasticity.SuperElasticHardeningModifications
session.odbs[name].materials[name].superElasticity.SuperElasticHardeningModifications
```

Required arguments

table A sequence of sequences of Floats specifying the items described below or user-defined data if the dependence of the transformation stress levels on plastic strain is specified in a user subroutine.

Table data

- Start of Transformation (Loading).
- End of Transformation (Loading).
- Start of Transformation (Unloading).
- End of Transformation (Unloading).
- Plastic Strain.

Return value

A SuperElasticHardeningModifications object.

Exceptions

RangeError.

setValues(...)

This method modifies the SuperElasticHardeningModifications object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *SuperElasticHardeningModifications* method.

Return value

`None.`

Exceptions

RangeError.

Members

The SuperElasticHardeningModifications object has members with the same names and descriptions as the arguments to the *SuperElasticHardeningModifications* method.

Corresponding analysis keywords

- **SUPERELASTIC HARDENING MODIFICATIONS*

SuperElasticity object

The SuperElasticity object specifies a superelastic material model.

Access

session.odbs[name].materials[name].superElasticity
```

SuperElasticity(...)

This method creates a SuperElasticity object.

Path

```
mdb.models[name].materials[name].SuperElasticity
session.odbs[name].materials[name].SuperElasticity
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

nonassociated `None` or a Float specifying the volumetric transformation strain. If *nonassociated*=`None`, the value of the volumetric transformation strain is equal to the uniaxial transformation strain. The default value is `None`.

Table data

- Young's Modulus (Martensite).
- Poisson's Ratio (Martensite).
- Transformation Strain.
- Start of Transformation (Loading).
- End of Transformation (Loading).
- Start of Transformation (Unloading).
- End of Transformation (Unloading).
- Start of Transformation in Compression (Loading).
- Reference Temperature.
- Loading.
- Unloading.

Return value

A SuperElasticity object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the SuperElasticity object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *SuperElasticity* method.

Return value

`None.`

Exceptions

RangeError.

Members

The SuperElasticity object has members with the same names and descriptions as the arguments to the *SuperElasticity* method.

In addition, the SuperElasticity object can have the following members:

superElasticHardening

A *SuperElasticHardening object*.

superElasticHardeningModifications

A *SuperElasticHardeningModifications object*.

Corresponding analysis keywords

Swelling object

The Swelling object specifies time-dependent volumetric swelling for a material.

Access

```
import material
mdb.models[name].materials[name].swelling
import odbMaterial
session.odbs[name].materials[name].swelling
```

Swelling(...)

This method creates a Swelling object.

Path

```
mdb.models[name].materials[name].Swelling
session.odbs[name].materials[name].Swelling
```

Required arguments

table
A sequence of sequences of Floats specifying the items described below.

This argument is valid only when *law*=INPUT.

Optional arguments

law
A SymbolicConstant specifying the type of data defining the swelling behavior. Possible values are INPUT and USER. The default value is INPUT.

temperatureDependency
A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- Volumetric swelling strain rate.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A Swelling object.

Exceptions

RangeError.

setValues(...)

This method modifies the Swelling object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Swelling* method.

Return value

`None.`

Exceptions

RangeError.

Members

The Swelling object has members with the same names and descriptions as the arguments to the *Swelling* method.

In addition, the Swelling object can have the following member:

ratios
A *Ratios* object.

Corresponding analysis keywords

- **SWELLING*

TensileFailure object

The TensileFailure object specifies the material tensile failure.

Access

```
import material
mdb.models[name].materials[name].plastic.tensileFailure
mdb.models[name].materials[name].eos.tensileFailure
import odbMaterial
session.odbs[name].materials[name].plastic.tensileFailure
session.odbs[name].materials[name].eos.tensileFailure
```

tensileFailure(...)

This method creates a tensileFailure object.

Path

```
mdb.models[name].materials[name].plastic.TensileFailure
mdb.models[name].materials[name].eos.TensileFailure
session.odbs[name].materials[name].plastic.TensileFailure
session.odbs[name].materials[name].eos.TensileFailure
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

temperatureDependency A boolean specifying whether the data depends on temperature. The default value is OFF.

elementDeletion A boolean specifying whether element deletion is allowed. The default value is True.

pressure A SymbolicConstant specifying the pressure stress. The Possible values are BRITTLE and DUCTILE.

shear A SymbolicConstant specifying the deviatoric stress. Possible values are BRITTLE and DUCTILE.

Table data

- The Hydrostatic cutoff stress (positive in tension).
- Temperature, if the data depend on temperature.
- Value of the first field variable if the data depend on field variables.
- Value of the second field variable.

- Etc.

Return value

An TensileFailure object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the TensileFailure object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *TensileFailure* method.

Return value

`None.`

Exceptions

RangeError.

Members

The TensileFailure object has members with the same names and descriptions as the arguments to the *TensileFailure* method.

Corresponding analysis keywords

- **TENSILE FAILURE*

TensionCutOff object

The TensionCutOff object specifies tension cutoff for different material models for example the Mohr-Coulomb plasticity model.

Access

```
import material
mdb.models[name].materials[name].mohrCoulombPlasticity.tensionCutOff
import odbMaterial
session.odbs[name].materials[name].mohrCoulombPlasticity.tensionCutOff
```

TensionCutOff(...)

This method creates a TensionCutOff object.

Path

```
mdb.models[name].materials[name].mohrCoulombPlasticity.TensionCutOff
session.odbs[name].materials[name].mohrCoulombPlasticity.TensionCutOff
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- Tension cutoff stress.
- The value of the corresponding tensile plastic strain.(The first tabular value entered must always be zero.)
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A TensionCutOff object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the TensionCutOff object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *TensionCutOff* method.

Return value

`None.`

Exceptions

RangeError.

Members

The TensionCutOff object has members with the same names and descriptions as the arguments to the *TensionCutOff* method.

Corresponding analysis keywords

- **TENSION CUTOFF*

TensionStiffening object

The TensionStiffening object defines the retained tensile stress normal to a crack in a *Concrete* model.

Access

```
import material
mdb.models[name].materials[name].concrete.tensionStiffening
import odbMaterial
session.odbs[name].materials[name].concrete.tensionStiffening
```

TensionStiffening(...)

This method creates a TensionStiffening object.

Path

```
mdb.models[name].materials[name].concrete.TensionStiffening
session.odbs[name].materials[name].concrete.TensionStiffening
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

type A SymbolicConstant specifying how the postcracking behavior is defined. Possible values are DISPLACEMENT and STRAIN. The default value is STRAIN.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

If *type*=STRAIN, the table data specify the following:

- Fraction of remaining stress to stress at cracking.
- Absolute value of the direct strain minus the direct strain at cracking.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *type*=DISPLACEMENT, the table data specify the following:

- Displacement, u_0, at which a linear loss of strength after cracking gives zero stress.
- Temperature, if the data depend on temperature.

- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A TensionStiffening object.

Exceptions

RangeError.

setValues(...)

This method modifies the TensionStiffening object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *TensionStiffening* method.

Return value

`None.`

Exceptions

RangeError.

Members

The TensionStiffening object has members with the same names and descriptions as the arguments to the *TensionStiffening* method.

Corresponding analysis keywords

- **TENSION STIFFENING*

TriaxialTestData object

The TriaxialTestData object provides triaxial test data.

Access

```
import material
mdb.models[name].materials[name].druckerPrager.triaxialTestData
import odbMaterial
session.odbs[name].materials[name].druckerPrager.triaxialTestData
```

TriaxialTestData(...)

This method creates a TriaxialTestData object.

Path

```
mdb.models[name].materials[name].druckerPrager.TriaxialTestData
session.odbs[name].materials[name].druckerPrager.TriaxialTestData
```

Required arguments

table
A sequence of sequences of Floats specifying the items described below.

Optional arguments

a
`None` or a Float specifying the value of the material constant a. `None` is used when the value is unknown or it is not held fixed at the input value. The default value is `None`.

b
`None` or a Float specifying the value of the material constant b. `None` is used when the value is unknown or it is not held fixed at the input value. The default value is `None`.

pt
`None` or a Float specifying the value of the material constant p_t. `None` is used when the value is unknown or it is not held fixed at the input value. The default value is `None`.

Table data

- Sign and magnitude of confining stress, $\sigma_1 = \sigma_2$.
- Sign and magnitude of the stress in loading direction, σ_3.

Return value

A TriaxialTestData object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the TriaxialTestData object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *TriaxialTestData* method.

Return value

`None.`

Exceptions

RangeError.

Members

The TriaxialTestData object has members with the same names and descriptions as the arguments to the *TriaxialTestData* method.

Corresponding analysis keywords

- **TRIAXIAL TEST DATA*

Trs object

The Trs object defines the temperature-time shift for time history viscoelastic analysis.

Access

```
import material
mdb.models[name].materials[name].viscoelastic.trs
mdb.models[name].materials[name].viscosity.trs
import odbMaterial
session.odbs[name].materials[name].viscoelastic.trs
session.odbs[name].materials[name].viscosity.trs
```

Trs(...)

This method creates a Trs object.

Path

```
mdb.models[name].materials[name].viscoelastic.Trs
mdb.models[name].materials[name].viscosity.Trs
session.odbs[name].materials[name].viscoelastic.Trs
session.odbs[name].materials[name].viscosity.Trs
```

Required arguments

None.

Optional arguments

definition A SymbolicConstant specifying the definition of the shift function. Possible values are WLF, ARRHENIUS, and USER. The default value is WLF.

table A sequence of sequences of Floats specifying the items described below. The default value is an empty sequence.

This argument is valid only when *definition*=WLF.

Table data

- Reference temperature, θ_0.
- Calibration constant, C_1.
- Calibration constant, C_2.

Return value

A Trs object.

Exceptions

None.

`setValues(...)`

This method modifies the Trs object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Trs* method.

Return value

`None.`

Exceptions

None.

Members

The Trs object has members with the same names and descriptions as the arguments to the *Trs* method.

Corresponding analysis keywords

- **TRS*

UniaxialTestData object

The UniaxialTestData object provides uniaxial test data (compression and/or tension).

Access

```
import material
mdb.models[name].materials[name].hyperelastic.uniaxialTestData
mdb.models[name].materials[name].hyperfoam.uniaxialTestData
mdb.models[name].materials[name].lowDensityFoam\
.uniaxialCompressionTestData
mdb.models[name].materials[name].lowDensityFoam\
.uniaxialTensionTestData
mdb.models[name].materials[name].mullinsEffect.uniaxialTests[i]
import odbMaterial
session.odbs[name].materials[name].hyperelastic.uniaxialTestData
session.odbs[name].materials[name].hyperfoam.uniaxialTestData
session.odbs[name].materials[name].lowDensityFoam\
.uniaxialCompressionTestData
session.odbs[name].materials[name].lowDensityFoam\
.uniaxialTensionTestData
session.odbs[name].materials[name].mullinsEffect.uniaxialTests[i]
```

UniaxialTestData(...)

This method creates a UniaxialTestData object.

Path

```
mdb.models[name].materials[name].hyperelastic.UniaxialTestData
mdb.models[name].materials[name].hyperfoam.UniaxialTestData
mdb.models[name].materials[name].lowDensityFoam.UniaxialTestData
mdb.models[name].materials[name].mullinsEffect.UniaxialTestData
session.odbs[name].materials[name].hyperelastic.UniaxialTestData
session.odbs[name].materials[name].hyperfoam.UniaxialTestData
session.odbs[name].materials[name].lowDensityFoam.UniaxialTestData
session.odbs[name].materials[name].mullinsEffect.UniaxialTestData
```

Required arguments

table
A sequence of sequences of Floats specifying the items described below.

Optional arguments

smoothing
`None` or an Int specifying the value for smoothing. If *smoothing*=`None`, no smoothing is employed. The default value is `None`.

lateralNominalStrain
A Boolean specifying whether to include lateral nominal strain. The default value is OFF.

temperatureDependency
A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

For a hyperelastic material model, the table data specify the following:

- Nominal stress, T_U.
- Nominal strain, ϵ_U.

For a hyperfoam material model, the table data specify the following:

- Nominal stress, T_L.
- Nominal strain, ϵ_U.
- Nominal lateral strain, $\epsilon_2 = \epsilon_3$. The default value is 0.

For a low-density foam material model, the table data specify the following:

- Nominal stress, T_U.
- Nominal strain, ϵ_U.
- Nominal strain rate, $\dot{\epsilon_U}$.

Return value

A UniaxialTestData object.

Exceptions

None.

`setValues(...)`

This method modifies the UniaxialTestData object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *UniaxialTestData* method.

Return value

`None.`

Exceptions

None.

Members

The UniaxialTestData object has members with the same names and descriptions as the arguments to the *UniaxialTestData* method.

Corresponding analysis keywords

- **UNIAXIAL TEST DATA*

UserDefinedField object

The UserDefinedField object redefines field variables at a material point.

Access

```
import material
mdb.models[name].materials[name].userDefinedField
import odbMaterial
session.odbs[name].materials[name].userDefinedField
```

UserDefinedField()

This method defines a UserDefinedField object.

Path

```
mdb.models[name].materials[name].UserDefinedField
session.odbs[name].materials[name].UserDefinedField
```

Arguments

None.

Return value

A UserDefinedField object.

Exceptions

None.

Members

The UserDefinedField object has no members.

Corresponding analysis keywords

- **USER DEFINED FIELD*

UserMaterial object

The UserMaterial object defines material constants for use in subroutines *UMAT*, *UMATHT*, or *VUMAT*.

Access

```
import material
mdb.models[name].materials[name].userMaterial
import odbMaterial
session.odbs[name].materials[name].userMaterial
```

UserMaterial(...)

This method creates a UserMaterial object.

Path

```
mdb.models[name].materials[name].UserMaterial
session.odbs[name].materials[name].UserMaterial
```

Required arguments

None.

Optional arguments

type

A SymbolicConstant specifying the type of material behavior defined by the command. Possible values are MECHANICAL, THERMAL, and THERMOMECHANICAL. The default value is MECHANICAL.

unsymm

A Boolean specifying if the material stiffness matrix, $\partial \Delta \boldsymbol{\sigma} / \partial \Delta \boldsymbol{\varepsilon}$, is not symmetric or, when a thermal constitutive model is used, if $\partial \mathbf{f} / \partial (\partial \theta / \partial \mathbf{x})$ is not symmetric. The default value is OFF.

This argument is valid only for an Abaqus/Standard analysis.

mechanicalConstants

A sequence of Floats specifying the mechanical constants of the material. This argument is valid only when *type*=MECHANICAL or THERMOMECHANICAL. The default value is an empty sequence.

thermalConstants

A sequence of Floats specifying the thermal constants of the material. This argument is valid only when *type*=THERMAL or THERMOMECHANICAL. The default value is an empty sequence.

effmod

A Boolean specifying if effective bulk modulus and shear modulus are returned by user subroutine *VUMAT*. The default value is OFF.

This argument is valid only in an Abaqus/Explicit analysis.

hybridFormulation

A SymbolicConstant to specify the formulation of the hybrid elements with user subroutine *UMAT*. Possible values are TOTAL, INCREMENTAL, INCOMPRESSIBLE, and NONE,

which means that Abaqus/CAE will not specify a hybrid formulation and the Abaqus solver default will be used. The default value is NONE.

This argument is valid only in an Abaqus/Standard analysis.

Return value

A UserMaterial object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the UserMaterial object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *UserMaterial* method.

Return value

`None.`

Exceptions

RangeError.

Members

The UserMaterial object has members with the same names and descriptions as the arguments to the *UserMaterial* method.

Corresponding analysis keywords

- **USER MATERIAL*

UserOutputVariables object

The UserOutputVariables object specifies the number of user-defined output variables.

Access

```
import material
mdb.models[name].materials[name].userOutputVariables
import odbMaterial
session.odbs[name].materials[name].userOutputVariables
```

UserOutputVariables(...)

This method creates a UserOutputVariables object.

Path

```
mdb.models[name].materials[name].UserOutputVariables
session.odbs[name].materials[name].UserOutputVariables
```

Required arguments

None.

Optional arguments

n An Int specifying the number of user-defined variables required at each material point. The default value is 0.

Return value

A UserOutputVariables object.

Exceptions

RangeError.

setValues(...)

This method modifies the UserOutputVariables object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *UserOutputVariables* method.

Return value

`None.`

Exceptions

RangeError.

Members

The UserOutputVariables object has members with the same names and descriptions as the arguments to the *UserOutputVariables* method.

Corresponding analysis keywords

- **USER OUTPUT VARIABLES*

VelocityDependence object

The VelocityDependence object specifies the dependence of the permeability of a material on the velocity of fluid flow.

Access

```
import material
mdb.models[name].materials[name].permeability.velocityDependence
import odbMaterial
session.odbs[name].materials[name].permeability.velocityDependence
```

VelocityDependence(...)

This method creates a VelocityDependence object.

Path

```
mdb.models[name].materials[name].permeability.VelocityDependence
session.odbs[name].materials[name].permeability.VelocityDependence
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

None.

Table data

- β. Only $\beta > 0.0$ is allowed.
- Void ratio, e.

Return value

A VelocityDependence object.

Exceptions

RangeError.

setValues(...)

This method modifies the VelocityDependence object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *VelocityDependence* method.

Return value

`None.`

Exceptions

RangeError.

Members

The VelocityDependence object has members with the same names and descriptions as the arguments to the *VelocityDependence* method.

Corresponding analysis keywords

- **PERMEABILITY*

Viscoelastic object

The Viscoelastic object specifies dissipative behavior for use with elasticity.

Access

```
import material
mdb.models[name].materials[name].viscoelastic
import odbMaterial
session.odbs[name].materials[name].viscoelastic
```

Viscoelastic(...)

This method creates a Viscoelastic object.

Path

```
mdb.models[name].materials[name].Viscoelastic
session.odbs[name].materials[name].Viscoelastic
```

Required arguments

domain

A SymbolicConstant specifying the domain definition. Possible values are:

- FREQUENCY, specifying a frequency domain. This domain is only available for an Abaqus/Standard analysis.
- TIME, specifying a time domain.

table

A sequence of sequences of Floats specifying the items described below.

Optional arguments

frequency

A SymbolicConstant specifying the frequency domain definition. This argument is required only when *domain*=FREQUENCY. Possible values are FORMULA, TABULAR, PRONY, CREEP_TEST_DATA, and RELAXATION_TEST_DATA. The default value is FORMULA.

type

A SymbolicConstant specifying the type. This argument is required only when *domain*=FREQUENCY and *frequency*=TABULAR. Possible values are ISOTROPIC and TRACTION. The default value is ISOTROPIC.

preload

A SymbolicConstant specifying the preload. This argument is required only when *domain*=FREQUENCY and *frequency*=TABULAR. Possible values are NONE, UNIAXIAL, VOLUMETRIC, and UNIAXIAL_VOLUMETRIC. The default value is NONE.

time

A SymbolicConstant specifying the time domain definition. This argument is required only when *domain*=TIME. Possible values are PRONY, CREEP_TEST_DATA, RELAXATION_TEST_DATA, and FREQUENCY_DATA. The default value is PRONY.

errtol

A Float specifying the allowable average root-mean-square error of the data points in the least-squares fit. The Float values correspond to percentages; for example, 0.01 is 1%. The default value is 0.01.

This argument is valid only when *time*=CREEP_TEST_DATA, RELAXATION_TEST_DATA or FREQUENCY_DATA; or only when *frequency*=CREEP_TEST_DATA or RELAXATION_TEST_DATA.

nmax

An Int specifying the maximum number of terms N in the Prony series. The maximum value is 13. The default value is 13.

This argument is valid only when *time*=CREEP_TEST_DATA, RELAXATION_TEST_DATA or FREQUENCY_DATA; or only when *frequency*=CREEP_TEST_DATA or RELAXATION_TEST_DATA.

volumetricTable

A sequence of sequences of Floats specifying the items described below. The default value is an empty sequence.

Table data

If *frequency*=FORMULA, the table data for *table* specify the following:

- Real part of $g_1^*(g^*(\omega) = g_1^* f^{-a})$.
- Imaginary part of g_1^*.
- Value of a.
- Real part of $k_1^*(k^*(\omega) = k_1^* f^{-b})$. If the material is incompressible, this value is ignored.
- Imaginary part of k_1^*. If the material is incompressible, this value is ignored.
- Value of b. If the material is incompressible, this value is ignored.

If *frequency*=TABULAR and *type*=ISOTROPIC and *preload*=NONE, or *time*=FREQUENCY_DATA the table data for *table* specify the following:

- Real part of $\omega g^*(\omega \Re(g^*) = G_\ell / G_\infty)$.
- Imaginary part of $\omega g^*(\omega \Im(g^*) = 1 - G_s / G_\infty)$.
- Real part of $\omega k^*(\omega \Re(k^*) = \mathrm{K}_\ell / \mathrm{K}_\infty)$. If the material is incompressible, this value is ignored.
- Imaginary part of $\omega k^*(\omega \Im(k^*) = 1 - \mathrm{K}_s / \mathrm{K}_\infty)$. If the material is incompressible, this value is ignored.
- Frequency f in cycles per time.

If *frequency*=TABULAR and *type*=ISOTROPIC and *preload*=UNIAXIAL the table data for *table* specify the following:

- Loss modulus.
- Storage modulus.
- Frequency.
- Uniaxial strain.

If *frequency*=TABULAR and *type*=TRACTION and *preload*=NONE the table data for *table* specify the following:

- Normalized loss modulus.
- Normalized shear modulus.

- Frequency.

If *frequency*=TABULAR and *type*=TRACTION and *preload*=UNIAXIAL or *preload*=UNIAXIAL_VOLUMETRIC the table data for *table* specify the following:

- Loss modulus.
- Storage modulus.
- Frequency.
- Closure.

If *time*=PRONY or *frequency*=PRONY, the table data for *table* specify the following:

- $\overline{g}_1^P$, the modulus ratio in the first term in the Prony series expansion of the shear relaxation modulus.
- $\overline{k}_1^P$, the modulus ratio in the first term in the Prony series expansion of the bulk relaxation modulus.
- τ_1, the relaxation time for the first term in the Prony series expansion.

If *frequency*=TABULAR and *type*=ISOTROPIC and *preload*=VOLUMETRIC or *preload*=UNIAXIAL_VOLUMETRIC the table data for *volumetricTable* specify the following:

- Loss modulus.
- Storage modulus.
- Frequency.
- Volume ratio.

Return value

A Viscoelastic object.

Exceptions

RangeError.

`setValues(...)`

This method modifies the Viscoelastic object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Viscoelastic* method.

Return value

`None.`

Exceptions

RangeError.

Members

The Viscoelastic object has members with the same names and descriptions as the arguments to the *Viscoelastic* method.

In addition, the Viscoelastic object can have the following members:

combinedTestData A *CombinedTestData* object.

shearTestData A *ShearTestData* object.

trs A *Trs* object.

volumetricTestData A *VolumetricTestData* object.

Corresponding analysis keywords

Viscosity object

The Viscosity object specifies mechanical viscosity.

Access

```
import material
mdb.models[name].materials[name].viscosity
import odbMaterial
session.odbs[name].materials[name].viscosity
```

Viscosity(...)

This method creates a Viscosity object.

Path

```
mdb.models[name].materials[name].Viscosity
session.odbs[name].materials[name].Viscosity
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

type A SymbolicConstant specifying the type of viscosity. The default value is NEWTONIAN.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

If *type*=NEWTONIAN, the table data specify the following:

- Viscosity, k.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A Viscosity object.

Exceptions

RangeError.

setValues(...)

This method modifies the Viscosity object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Viscosity* method.

Return value

`None.`

Exceptions

RangeError.

Members

The Viscosity object has members with the same names and descriptions as the arguments to the *Viscosity* method.

In addition, the Viscosity object can have the following member:

trs A *Trs* object.

Corresponding analysis keywords

- **VISCOSITY*

Viscous object

The Viscous object specifies the viscous properties for a two-layer viscoplastic material model.

Access

```
import material
mdb.models[name].materials[name].viscous
import odbMaterial
session.odbs[name].materials[name].viscous
```

Viscous(...)

This method creates a Viscous object.

Path

```
mdb.models[name].materials[name].Viscous
session.odbs[name].materials[name].Viscous
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

law A SymbolicConstant specifying the creep law. Possible values are STRAIN, TIME, USER, ANAND, DARVEAUX, DOUBLE_POWER, POWER_LAW, and TIME_POWER_LAW. The default value is STRAIN.

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

time A SymbolicConstant specifying the time interval for relevant laws. Possible values are CREEP and TOTAL. The default value is TOTAL.

Table data

If *law*=STRAIN or *law*=TIME, the table data specify the following:

- A.
- n.
- m.
- f.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *law*=USER, the table data specify the following:

- f.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

If *law*=ANAND, the table data specify the following:

- s_1.
- $\frac{Q}{R}$.
- A.
- ξ.
- m.
- A_0.
- $\hat{s}$.
- n.
- a.
- S_2.
- S_3.
- A_1.
- A_2.
- A_3.
- A_4.
- f.

If *law*=DARVEAUX, the table data specify the following:

- C_{ss}.
- $\frac{Q}{R}$.
- α.
- n.
- ϵ_T.
- B.
- f.

If *law*=DOUBLE_POWER, the table data specify the following:

- A_1.
- B_1.
- C_1.
- A_2.
- B_2.
- C_2.
- σ_0.
- f.

If *law*=POWER_LAW or *law*=TIME_POWER_LAW, the table data specify the following:

- q_0.
- n.
- m.
- $\dot{\varepsilon}_0$.
- f.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A Viscous object.

Exceptions

None.

`setValues(...)`

This method modifies the Viscous object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *Viscous* method.

Return value

`None.`

Exceptions

None.

Members

The Viscous object has members with the same names and descriptions as the arguments to the *Viscous* method.

In addition, the Viscous object can have the following member:

potential
A *Potential* object.

Corresponding analysis keywords

VoidNucleation object

The VoidNucleation object defines the nucleation of voids in a porous material.

Access

```
import material
mdb.models[name].materials[name].porousMetalPlasticity.voidNucleation
import odbMaterial
session.odbs[name].materials[name].porousMetalPlasticity\
.voidNucleation
```

VoidNucleation(...)

This method creates a VoidNucleation object.

Path

```
mdb.models[name].materials[name].porousMetalPlasticity.VoidNucleation
session.odbs[name].materials[name].porousMetalPlasticity\
.VoidNucleation
```

Required arguments

table A sequence of sequences of Floats specifying the items described below.

Optional arguments

temperatureDependency A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies An Int specifying the number of field variable dependencies. The default value is 0.

Table data

- ε_N, the mean value of the nucleation-strain normal distribution.
- s_N, the standard deviation of the nucleation-strain normal distribution.
- f_N, the volume fraction of nucleating voids.
- Temperature, if the data depend on temperature.
- Value of the first field variable, if the data depend on field variables.
- Value of the second field variable.
- Etc.

Return value

A VoidNucleation object.

Exceptions

RangeError.

setValues(...)

This method modifies the VoidNucleation object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *VoidNucleation* method.

Return value

`None.`

Exceptions

RangeError.

Members

The VoidNucleation object has members with the same names and descriptions as the arguments to the *VoidNucleation* method.

Corresponding analysis keywords

- **VOID NUCLEATION*

VolumetricTestData object

The VolumetricTestData object provides volumetric test data.

Access

```
import material
mdb.models[name].materials[name].hyperelastic.volumetricTestData
mdb.models[name].materials[name].hyperfoam.volumetricTestData
mdb.models[name].materials[name].viscoelastic.volumetricTestData
import odbMaterial
session.odbs[name].materials[name].hyperelastic.volumetricTestData
session.odbs[name].materials[name].hyperfoam.volumetricTestData
session.odbs[name].materials[name].viscoelastic.volumetricTestData
```

VolumetricTestData(...)

This method creates a VolumetricTestData object.

Path

```
mdb.models[name].materials[name].hyperelastic.VolumetricTestData
mdb.models[name].materials[name].hyperfoam.VolumetricTestData
mdb.models[name].materials[name].viscoelastic.VolumetricTestData
session.odbs[name].materials[name].hyperelastic.VolumetricTestData
session.odbs[name].materials[name].hyperfoam.VolumetricTestData
session.odbs[name].materials[name].viscoelastic.VolumetricTestData
```

Required arguments

table
A sequence of sequences of Floats specifying the items described below.

Optional arguments

volinf
`None` or a Float specifying a normalized volumetric value that depends on the value of the *time* member of the *Viscoelastic* object. The default value is `None`.

If *time*=RELAXATION_TEST_DATA, *volinf* specifies the value of the long-term, normalized volumetric modulus, $k_R(\infty)$.

If *time*=CREEP_TEST_DATA, *volinf* specifies the value of the long-term, normalized volumetric compliance, $j_K(\infty)$.

This argument is valid only for a viscoelastic material model.

smoothing
`None` or an Int specifying the value for smoothing. If *smoothing*=`None`, no smoothing is employed. The default value is `None`.

temperatureDependency
A Boolean specifying whether the data depend on temperature. The default value is OFF.

dependencies
An Int specifying the number of field variable dependencies. The default value is 0.

Table data

For a hyperelastic or hyperfoam material model, the table data specify the following:

- Pressure, p.
- Volume ratio, J (current volume/original volume).

For a viscoelastic material model, the values depend on the value of the *time* member of the *Viscoelastic* object.

If *time*=RELAXATION_TEST_DATA, the table data specify the following:

- Normalized volumetric (bulk) modulus $k_R(t), \quad (0 \le k_R(t) \le 1)$.
- Time $t(t > 0)$.

If *time*=CREEP_TEST_DATA, the table data specify the following:

- Normalized volumetric (bulk) compliance $j_K(t), \quad (j_K(t) \ge 1)$.
- Time $t(t > 0)$.

Return value

A VolumetricTestData object.

Exceptions

None.

setValues(...)

This method modifies the VolumetricTestData object.

Required arguments

None.

Optional arguments

The optional arguments to `setValues` are the same as the arguments to the *VolumetricTestData* method.

Return value

`None.`

Exceptions

None.

Members

The VolumetricTestData object has members with the same names and descriptions as the arguments to the *VolumetricTestData* method.

Corresponding analysis keywords

- **VOLUMETRIC TEST DATA*

evaluateMaterial

This command evaluates the behavior of a hyperelastic material under standard test conditions.

Access

```
from material import evaluateMaterial
```

evaluateMaterial

This method evaluates the behavior of a hyperelastic material under standard test conditions.

Path

```
evaluateMaterial
```

Required arguments

material A Material object.

simulationName A String specifying the name to be used for the material evaluation simulation.

Optional arguments

Note:

Although *uniaxialStrainRange*, *biaxialStrainRange*, *planarStrainRange*, *volumeRatioRange*, and *simpleShearStrainRange* are optional arguments, at least one of them must be specified with a nonzero value.

dataSource A SymbolicConstant specifying whether test data or coefficients should be used for the material definition in the unit element tests. Possible values are TEST_DATA or COEFFICIENTS.

strainEnergyPotentials A sequence of SymbolicConstants specifying for which material models the material is to be evaluated. Possible values are POLY_N1, POLY_N2, POLY_N3, POLY_N4, POLY_N5, POLY_N6, OGDEN_N1, OGDEN_N2, OGDEN_N3, OGDEN_N4, OGDEN_N5, OGDEN_N6, REDUCED_POLY_N1, REDUCED_POLY_N2, REDUCED_POLY_N3, REDUCED_POLY_N4, REDUCED_POLY_N5, REDUCED_POLY_N6, ARRUDA_BOYCE, VAN_DER_WAALS, YEOH, MOONEY_RIVLIN, and NEO_HOOKE.

Note:

The options POLY_N3, POLY_N4, POLY_N5, and POLY_N6 are valid only if the material was defined by providing coefficients of the strain energy potential.

marlowData `None` or a sequence of SymbolicConstants specifying the types of test data to be included in the material definition of the Marlow material that is being evaluated. Possible values are UNIAXIAL, BIAXIAL, PLANAR, or VOLUMETRIC. The default value is `None`.

marlowDataType `None` or a SymbolicConstant specifying the input data type for the Marlow material model. Possible values are TENSION, COMPRESSION, or BOTH.

testDataTypes A sequence of SymbolicConstants specifying the types of test data to be included in the material definition of the material being evaluated. Possible values are UNIAXIAL, BIAXIAL, PLANAR, and VOLUMETRIC.

uniaxialStrainRange A tuple of Floats specifying minimum and maximum nominal strains to be applied in the uniaxial tension test.

biaxialStrainRange A tuple of Floats specifying the minimum and maximum nominal strains to be applied in the biaxial tension test.

planarStrainRange A tuple of Floats specifying the minimum and maximum nominal strains to be applied in the planar test. The planar test is equivalent to a pure shear test.

volumeRatioRange A tuple of Floats specifying the minimum and maximum compressive volume ratio.

simpleShearStrainRange A tuple of Floats specifying the minimum and maximum nominal strains to be applied in the simple shear test.

viscoDataSource `None` or a SymbolicConstant specifying whether test data or coefficients should be used for the viscoelastic material definition in the element tests. Possible values are TEST_DATA or COEFFICIENTS. The default value is `None`.

viscoTestDataTypes `None` or a sequence of SymbolicConstants specifying the types of test data to be included in the material definition of the viscoelastic material being evaluated. Possible values are UNIAXIAL, BIAXIAL, PLANAR, or VOLUMETRIC. The default value is `None`.

relaxationTime `None` or a Float specifying the time period for the stress relaxation response mode. The default value is `None`.

creepTime `None` or a Float specifying the time period for the creep response mode. The default value is `None`.

Return value

`None`.

Exceptions

If *dataSource*=TEST_DATA and *strainEnergyPotentials* contains POLY_N3, POLY_N4, POLY_N5, or POLY_N6:	MaterialEvaluationError: POLY_N3, POLY_N4, POLY_N5, or POLY_N6

not allowed for *dataSource*=TEST_DATA.

If the material evaluation failed:

MaterialEvaluationError: material evaluation failed, see *path to data file*.

If the material type of the material to be evaluated is not hyperelastic:

MaterialEvaluationError: Material evaluation is currently supported only for hyperelastic materials.

Mdb commands

Mdb commands are used to create and upgrade an Abaqus model database that stores models and analysis controls.

In this section:

- *Mdb object*
- *Mdb commands*

Mdb object

The Mdb object is the high-level Abaqus model database. A model database stores models and analysis controls.

Access

```
mdb
```

Mdb(...)

This constructor creates an empty Mdb object.

Path

```
Mdb
```

Required arguments

None.

Optional arguments

pathName A String specifying the path to be used when the model database is saved to a file. If you do not provide a file extension, `.cae` is appended automatically to the path. The default value is an empty string.

Return value

A Mdb object.

Exceptions

None.

importDxf(...)

This method creates a *ConstrainedSketch* object from a file containing dxf-format (AutoCAD) geometry. Only a limited number of entities are supported. This format should be used only if no other formats are available.

Path

```
importDxf
```

Required arguments

fileName A String specifying the path to the dxf file to open.

Optional arguments

None.

Return value

A Mdb object.

Exceptions

None.

openMdb(...)

This method opens an existing model database file.

Path

```
openMdb
```

Required arguments

pathName A String specifying the path to the model database file to open. If you do not provide a file extension, Abaqus/CAE attempts to open the file with `.cae` appended to the path.

Optional arguments

None.

Return value

An Mdb object.

Exceptions

If the file is an invalid model database:	MdbError: invalid model database.
If the file contains a model database from an Abaqus release other than the Abaqus release you are currently running:	MdbError: incompatible release number, expected *<Abaqus release>*, got *<earlier or later Abaqus release>*
If the model database file is already opened in write mode:	MdbError: cannot open file: May be in use by another CAE session
If the command fails to open the model database file for reasons not mentioned above:	MdbError: cannot open file...

openAcis(...)

This method creates an *AcisFile* object from a file containing ACIS-format geometry. This object is subsequently used by the `PartFromGeometryFile` method.

Path

```
openAcis
```

Required arguments

fileName A String specifying the path to the ACIS file to open.

Optional arguments

scaleFromFile A Boolean specifying whether to scale, rotate, and translate the part using the transform read from the ACIS file. The default value is OFF.

Return value

An AcisFile object.

Exceptions

File is from a newer version of ACIS than the CAE kernel.	Texterror: ACIS File version exceeds Kernel.
The data in the ACIS file are corrupted.	Texterror: Failed to read ACIS file.

openCatia(...)

This method creates an *AcisFile* object from a file containing CATIA V5–format geometry. This object is subsequently used by the `PartFromGeometryFile` method.

Path

```
openCatia
```

Required arguments

fileName A String specifying the path to the CATIA file to open.

Optional arguments

topology A SymbolicConstant specifying the topology of the data to be read from the file and of the part to be created. Possible values are SOLID, SHELL, and WIRE. If *topology*=SOLID, Abaqus/CAE attempts to attach cells to create a solid. If *topology*=SHELL, Abaqus/CAE builds the body as a shell entity and not as a solid entity. The default value is SOLID.

convertUnits A SymbolicConstant specifying whether the original units should be retained. Possible values are ON and OFF. The default value is OFF.

combineBodies A Boolean specifying whether to combine the bodies in the CATPart file. If the bodies to be combined touch or overlap, invalid entities would result. For CATProduct files, this option will be ignored.

Return value

An AcisFile object.

Exceptions

None.

openEnf(...)

This method creates an*AcisFile* object from a file containing Elysium Neutral File-format geometry that was created by CATIA V5, I-DEAS, or Pro/ENGINEER. This object is subsequently used by the `PartFromGeometryFile` method.

Path

```
openEnf
```

Required arguments

fileName
A String specifying the path to the Elysium Neutral File that was created by I-DEAS, Pro/ENGINEER, or CATIA V5.

fileType
A String specifying the type of CAD system that created the file. Possible values are “ideas”, “proe”, or “catiav5”.

Optional arguments

topology
A SymbolicConstant specifying the topology of the data to be read from the file and of the part to be created. Possible values are SOLID, SHELL, and WIRE. If *topology*=SOLID, Abaqus/CAE attempts to attach cells to create a solid. If *topology*=SHELL, Abaqus/CAE builds the body as a shell entity and not as a solid entity. The default value is SOLID.

convertUnits
A Boolean specifying if the dimensions of the part should be converted to millimeters. The default value is OFF.

Return value

An AcisFile object.

Exceptions

None.

openIges(...)

This method creates an *AcisFile* object from a file containing IGES-format geometry. This object is subsequently used by the `PartFromGeometryFile` method.

Path

```
openIges
```

Required arguments

fileName
A String specifying the path to the IGES file to open.

Optional arguments

trimCurve

A SymbolicConstant specifying the method used to define the trim curves that bound parametric surfaces. Possible values are:

- DEFAULT, use either of the following as specified by the contents of the IGES file.
- PARAMETRIC_DATA, use the parameter space of the surface being trimmed.
- THREED_DATA, use real space—the coordinate system of the part along with an indication that the trim curve lies on the parametric surface.

The default value is DEFAULT.

scaleFromFile

A SymbolicConstant specifying whether the imported geometry needs to be scaled using the units information available in the IGES file. Possible values are ON and OFF. The default value is OFF. When the argument is set to ON, the geometry is scaled to millimeters with respect to the unit system specified in the IGES file.

msbo

A Boolean specifying if the IGES file contains MSBO (Manifold Solid B-Rep Object) entities. The default value is False.

includedLayers

A sequence of Ints specifying the levels or layers of entities that will be translated from the IGES file to build the part. The default is to include all the layers.

topology

A SymbolicConstant specifying the topology of the data to be read from the file and of the part to be created. Possible values are SOLID, SHELL, and WIRE. If *topology*=SOLID, Abaqus/CAE attempts to attach cells to create a solid. If *topology*=SHELL, Abaqus/CAE builds the body as a shell entity and not as a solid entity. The default value is SOLID.

uniteWires

A SymbolicConstant specifying whether the imported wires need to be united or not. Possible values are ON andOFF. The default value is ON. When importing a sketch, this value is set to OFF.

Return value

An AcisFile object.

Exceptions

The data in the IGES file are corrupted.	Texterror: Failed to read IGES file.

openParasolid(...)

This method creates an*AcisFile* object from a file containing Parasolid-format geometry. This object is subsequently used by the `PartFromGeometryFile` method.

Path

```
openParasolid
```

Required arguments

fileName A String specifying the path to the Parasolid file to open.

Optional arguments

topology A SymbolicConstant specifying the topology of the data to be read from the file and of the part to be created. Possible values are SOLID, SHELL, and WIRE. If *topology*=SOLID, Abaqus/CAE attempts to attach cells to create a solid. If *topology*=SHELL, Abaqus/CAE builds the body as a shell entity and not as a solid entity. The default value is SOLID.

Return value

An AcisFile object.

Exceptions

None.

openStep(...)

This method creates an *AcisFile* object from a file containing STEP-format geometry. This object is subsequently used by the `PartFromGeometryFile` method.

Path

```
openStep
```

Required arguments

fileName A String specifying the path to the STEP file to open.

Optional arguments

scale A Float specifying the scaling factor to apply to the imported geometric entities. The default value is 1.0.

Return value

An AcisFile object.

Exceptions

The data in the STEP file are corrupted. Texterror: Failed to read STEP file.

openVda(...)

This method creates an *AcisFile* object from a file containing VDA-FS-format geometry. This object is subsequently used by the `PartFromGeometryFile` method.

Path

```
openVda
```

Required arguments

fileName A String specifying the path to the VDA-FS file to open.

Optional arguments

None.

Return value

An AcisFile object.

Exceptions

The data in the VDA-FS file are corrupted. Texterror: Failed to read VDA file.

openSolidworks(...)

This method creates an *AcisFile* object from a file containing Solidworks format geometry. This object is subsequently used by the `PartFromGeometryFile` method.

Path

```
openSolidworks
```

Required arguments

fileName A String specifying the path to the Solidworks file to open.

Optional arguments

topology A SymbolicConstant specifying the topology of the data to be read from the file and of the part to be created. Possible values are SOLID, SHELL, and WIRE. If *topology*=SOLID, Abaqus/CAE attempts to attach cells to create a solid entity. If *topology*=SHELL, Abaqus/CAE builds the body as a shell entity, not as a solid entity. The default value is SOLID.

Return value

An AcisFile object.

Exceptions

The data in the Solidworks file are corrupted. Texterror: Failed to read Solidworks file.

close()

This method closes an open Mdb object but does not save the Mdb object to disk. After closing the Mdb object, this method creates a new unnamed empty Mdb object.

Arguments

None.

Return value

`None.`

Exceptions

None.

save()

This method saves an Mdb object to disk at the location specified by *pathName* (*pathName* is a member of the Mdb object).

Arguments

None.

Return value

`None.`

Exceptions

If *pathName* is empty:	MdbError: cannot save file: pathname member is empty
If *pathName* is `abaqus.cae`:	MdbError: “abaqus.cae” is an invalid CAE filename.
If the command fails to save the Mdb object to disk for reasons not mentioned above:	MdbError: cannot save file...

saveAs(...)

This method saves an Mdb object to disk at the specified location.

Required arguments

pathName	A String specifying the path to be used when the model database is saved to a file. If you do not provide a file extension, `.cae` is appended automatically to the path.

Optional arguments

None.

Return value
`None.`

Exceptions

If *pathName* is `abaqus.cae`:	MdbError: "abaqus.cae" is an invalid CAE filename.
If the command fails to save the Mdb object to disk for reasons not mentioned above:	MdbError: cannot save file...

`openAuxMdb(...)`

This method opens an auxiliary Mdb object on the disk at the specified location. This enables models from the auxiliary Mdb object to be copied into the current Mdb.

Required arguments

pathName	A String specifying the path to the auxiliary Mdb which is to be opened. If you do not provide a file extension, `.cae` is appended automatically to the path.

Optional arguments

None.

Return value
`None.`

Exceptions

If the file is an invalid model database:	MdbError: invalid model database.
If the file contains a model database from an Abaqus release other than the Abaqus release you are currently running:	MdbError: incompatible release number, expected *<Abaqus release>*, got *<earlier or later Abaqus release>*.
If the command fails to open the model database file for reasons not mentioned above:	MdbError: cannot open file...

`closeAuxMdb()`

This method closes the auxiliary Mdb which had been opened earlier using the `openAuxMdb` command.

Arguments

None.

Return value
`None.`

Exceptions

If the auxiliary Mdb was not opened earlier.	MdbError: The auxiliary Mdb was not opened..

`getAuxMdbModelNames()`

This method returns a list of model names present in the auxiliary Mdb which had been opened earlier using the `openAuxMdb` command.

Arguments

None.

Return value

A list of model names present in the auxiliaryMdb

Exceptions

If the auxiliary Mdb was not opened earlier.	MdbError: The auxiliary Mdb was not opened..

`copyAuxMdbModel(...)`

This method copies a specified model from the auxiliary Mdb which had been opened earlier using the `openAuxMdb` command.

Required arguments

fromName	A String specifying the model name in the auxiliary Mdb which is to be copied.

Optional arguments

toName	A String specifying the name to be given to the model after it is copied into the Mdb. If this argument is not specified *toName* is assumed to be the same as *fromName*. If a model with name *toName* already exists in Mdb, it is overwritten.

Return value

`None.`

Exceptions

If the auxiliary Mdb was not opened earlier.	MdbError: The auxiliary Mdb was not opened.
If the model fromName does not exist in the auxiliary Mdb.	KeyError: fromName does not exist.

Members

The Mdb object has members with the same names and descriptions as the arguments to the *Mdb* method.

In addition, the Mdb object can have the following members:

version
An Int specifying the release number of the Mdb object in memory.

lastChangedCount
A Float specifying the value of a counter associated with the Mdb object. The counter indicates when the Mdb object was last changed.

jobs
A repository of *Job* objects.

adaptivityProcesses
A repository of *AdaptivityProcess* objects.

coexecutions
A repository of *Coexecution* objects.

optimizationProcesses
A repository of *OptimizationProcess* objects.

meshEditOptions
A *MeshEditOptions* object specifying the undo/redo behavior when editing meshes on parts or part instances.

models
A repository of *Model* objects.

customData
A *RepositorySupport* object.

annotations
A repository of *Annotation* objects.

Mdb commands

The following command upgrades a model database (`.cae`) to the current release and writes the upgraded model database to a new file.

upgradeMdb

This method upgrades an existing Mdb object to the current release and writes the upgraded version of the Mdb object to a file. In addition, Abaqus/CAE writes information about the status of the upgrade to the log file (*upgradedMdbPath*`.log`).

Path

upgradeMdb

Required arguments

existingMdbPath A String specifying the path to the file containing the model database to be upgraded.

upgradedMdbPath A String specifying the path to the file that will contain the upgraded model database.

Optional arguments

None.

Return value

`None.`

Exceptions

If the model database upgrade fails: MdbError: cannot convert file

CombineOptResults

This method combines the results from existing ODB files for each optimization cycle and writes a merged ODB file.

Path

CombineOptResults

Required arguments

optResultLocation A String specifying the path to the folder in which optimization results are present.

Optional arguments

optIter

A Symbolic Constant to specify the optimization cycles from which the results should be merged. The possible values are INITIAL_AND_LAST, NONE, ALL, LAST, EVERY_NCYCLES, SPECIFY.

The default value is INITIAL_AND_LAST.

nValues

An Int or a tuple of Ints specifying the optimization cycles from which the results should be merged. This argument is used only when EVERY_NCYCLES or SPECIFY is selected for *optIter*.

The default value is ALL.

models

A tuple of strings specifying the list of *models* for which the merging of results is performed.

The default value is ALL.

steps

A tuple of strings specifying the list of steps from the selected *models* to be included in the odb merge.

The default value is ALL.

analysisFieldVariables

A tuple of strings specifying the list of *analysisFieldVariables* to be included in the odb merge.

The default value is ALL.

includeResultsFrom

A Symbolic Constant to specify the target odb to which the results will be merged. The possible values are ORIGINAL_MODEL, FIRST or LAST.

The default value is FIRST.

originalModel

A String to specify the path of target odb if *includeResultsFrom* is set to ORIGINAL_MODEL.

Mesh commands

Mesh commands are used to mesh part instances and regions.
Mesh commands are also used to assign element sizes, element types, and mesh control parameters.

In this section:

- *Assembly object*
- *Part object*
- *ElemType object*
- *MeshEdge object*
- *MeshEdgeArray object*
- *MeshElement object*
- *MeshElementArray object*
- *MesherOptions object*
- *MeshFace object*
- *MeshFaceArray object*
- *MeshNode object*
- *MeshNodeArray object*
- *MeshStats object*

Assembly object

The following commands operate on Assembly objects. For more information about the Assembly object, see *Assembly object*.

Access

```
import mesh
```

assignStackDirection(...)

This method assigns a stack direction to geometric cells. The stack direction will be used to orient the elements during mesh generation.

Required arguments

cells
A sequence of *Cell* objects specifying regions where to assign the stack direction.

referenceRegion
A *Face* object specifying the top side of the stack direction.

Optional arguments

None.

Return value

None.

Exceptions

None.

associateMeshWithGeometry(...)

This method associates a geometric entity with mesh entities that are either orphan elements, bounds orphan elements, or were created using the bottom-up meshing technique.

Required arguments

geometricEntity
A *Cell* , a *Face*, an *Edge*, or a *Vertex* object specifying geometric entity to be associated with one or more mesh entities.

If the geometric entity is a *Cell* object then the argument *elements* must be specified.

If the geometric entity is a *Face* object then the argument *elemFaces* must be specified.

If the geometric entity is an *Edge* object then the argument *elemEdges* must be specified.

If the geometric entity is a *Vertex* object then the argument *node* must be specified.

Optional arguments

elements
A sequence of *MeshElement* objects specifying the elements to be associated with the geometric cell.

elemFaces
A sequence of *MeshFace* objects specifying the element faces to be associated with the geometric face.

elemEdges
A sequence of *MeshEdge* objects specifying the element edges to be associated with the geometric edge.

node
A *MeshNode* object specifying the mesh node to be associated with the geometric vertex.

Return value
`None.`

Exceptions
None.

`createVirtualTopology(...)`

This method creates a virtual topology feature by automatically merging faces and edges based on a set of geometric parameters. The edges and vertices that are being merged will be ignored during mesh generation.

Required arguments

regions
A sequence of *Face* objects or *PartInstance* objects specifying the domain to search for geometric entities that need to be merged. Entities identified as candidates to be merged may be merged with entities from outside the specified region.

Optional arguments

mergeShortEdges
A Boolean specifying whether to merge short edges. The default value is False.

shortEdgeThreshold
A Float specifying a threshold that determines which edges are considered to be short. These edges are the candidate entities to be merged. This argument is a required argument if the argument *mergeShortEdges* equals True and it is ignored if the argument *mergeShortEdges* equals False.

mergeSmallFaces
A Boolean specifying whether to merge faces with small area. The default value is False.

smallFaceAreaThreshold
A Float specifying a threshold that determines which faces are considered to have a small area. These faces are the candidate entities to be merged. This argument is a required argument if the argument *mergeSmallFaces* equals True and it is ignored if the argument *mergeSmallFaces* equals False.

mergeSliverFaces

A Boolean specifying whether to merge faces with high aspect ratio. The default value is False.

faceAspectRatioThreshold

A Float specifying a threshold that determines which faces are considered to have high aspect ratio. These faces are candidate entities to be merged. This argument is a required argument if the argument *mergeSliverFaces* equals True and it is ignored if the argument *mergeSliverFaces* equals False.

mergeSmallAngleFaces

A Boolean specifying whether to merge faces that have a sharp corner angle. The default value is False.

smallFaceCornerAngleThreshold

A Float specifying a threshold that determines which face corner angles are considered to be small. These faces will be candidate entities to be merged. This argument is a required argument if the argument *mergeSmallAngleFaces* equals True and it is ignored if the argument *mergeSmallAngleFaces* equals False.

mergeThinStairFaces

A Boolean specifying whether to merge faces that represent a thin stair-like feature. The default value is False.

thinStairFaceThreshold

A Float specifying a threshold that determines which faces representing small stair-like features are considered thin. These faces will be candidate entities to be merged. This argument is required if the argument *mergeThinStairFaces* is True and it is ignored if *mergeThinStairFaces* is False.

ignoreRedundantEntities

A Boolean specifying whether to abstract away redundant edges and vertices. The default value is False.

cornerAngleTolerance

A Float specifying the angle deviation from 180 degrees at a vertex or at an edge such that the two edges radiating from the vertex or the two faces bounded by the edge can be merged. The default value is 30.0 degrees.

applyBlendControls

A Boolean specifying whether to verify that blend faces can be merged with neighboring faces. If *applyBlendControls* is True then all faces that have angle larger than *blendSubtendedAngleTolerance* and a radius smaller than *blendRadiusTolerance* will not be merged with neighboring faces unless the neighboring faces are also blend faces with similar geometric characteristics. The default value is False.

blendSubtendedAngleTolerance

A Float specifying the largest subtended angle of blend faces that can be merged with neighboring faces. This argument is a required argument if the argument *applyBlendControls* equals True and it is ignored if the argument *applyBlendControls* equals False.

blendRadiusTolerance

A Float specifying the smallest radius of curvature of blend faces that can be merged with neighboring faces. This argument is a required argument if the argument *applyBlendControls* equals True and it is ignored if the argument *applyBlendControls* equals False.

Return value

A Feature object.

Exceptions

None.

deleteBoundaryLayerControls(...)

This method deletes the control parameters for boundary layer mesh for all the specified regions.

Required arguments

regions A sequence of *Cell* objects specifying the regions for which to set the boundary layer mesh control parameters.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

deleteMesh(...)

This method deletes a subset of the mesh that contains the native elements from the given part instances or regions.

Required arguments

regions A sequence of *PartInstance* objects or *Region* objects specifying the part instances or regions from where the native mesh is to be deleted.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

deleteMeshAssociationWithGeometry(...)

This method deletes the association of geometric entities with mesh entities.

Required arguments

geometricEntities
A sequence of *Cell* objects, *Face* objects, *Edge* objects, or *Vertex* objects specifying the geometric entities that will be disassociated from the mesh.

Optional arguments

addBoundingEntities
A Boolean specifying whether the mesh will also be disassociated from the geometric entities that bounds the given *geometricEntities*. For example, if the argument *geometricEntities* contains a face, this boolean indicates whether the edges and vertices that bound the face will also be disassociated from the mesh. The default value is False.

Return value
`None.`

Exceptions

None.

`deletePreviewMesh()`

This method deletes all boundary meshes in the assembly. See the *boundaryPreview* argument of `generateMesh` for information about generating boundary meshes.

Arguments

None.

Return value
`None.`

Exceptions

None.

`deleteSeeds(...)`

This method deletes the global edge seeds from the given part instances or deletes the local edge seeds from the given edges.

Required arguments

regions
A sequence of *PartInstance* objects or Edge objects specifying the part instances or edges from which the seeds are to be deleted.

Optional arguments

None.

Return value
`None.`

Exceptions

None.

generateBottomUpExtrudedMesh(...)

This method generates solid elements by extruding a 2D mesh along a vector, either on an orphan mesh or within a cell region using a bottom-up technique.

Required arguments

cell
A *Cell* object specifying the geometric region where the mesh is to be generated. This argument is valid only for native part instances.

numberOfLayers
An Int specifying the number of layers to be generated along the extrusion vector.

extrudeVector
A sequence of sequences of Floats specifying the start point and end point of a vector. Each point is defined by a tuple of three coordinates indicating its position. The direction of the mesh extrusion operation is from the first point to the second point.

Optional arguments

At least one of the three optional "SourceSide" arguments must be specified.

geometrySourceSide
A *Region* of *Face* objects specifying the geometric domain to be used as the source for the extrude meshing operation.

elemFacesSourceSide
A sequence of *MeshFace* objects specifying the faces of 3D elements to be used as the source for the extrude meshing operation.

elemSourceSide
A sequence of 2D *MeshElement* objects specifying the elements to be used as the source for the extrude meshing operation.

depth
A Float specifying the distance of the mesh extrusion. If unspecified, the vector length of the *extrudeVector* argument is assumed.

targetSide
A datum plane, a sequence of *Face* objects, a sequence of *MeshFace* objects, or a sequence of 2D *MeshElement* objects specifying the target of the extrude meshing operation. If specified, this argument overrides the *depth* argument, and all points on the source will be extruded in the direction of the extrusion vector until meeting the target.

biasRatio
A Float specifying a ratio of the element size in the extrusion direction between the source and the target sides of the extrusion. The default is 1.0, meaning no bias.

extendElementSets
A Boolean specifying whether existing element sets that include source elements will be extended to also include extruded elements. This argument is ignored for native part instances. The default value is False.

Return value

`None.`

Exceptions

None.

generateBottomUpSweptMesh(...)

This method generates solid elements by sweeping a 2D mesh, either on an orphan mesh or within a cell region using a bottom-up technique.

Required arguments

cell
A *Cell* object specifying the geometric region where the mesh is to be generated. This argument is valid only for native part instances.

Optional arguments

At least one of the following three arguments must be specified: *geometrySourceSide*, *elemFacesSourceSide*, or *elemSourceSide*.

In addition one of the following two sets of arguments must also be specified:

- One of the following three arguments: *geometryConnectingSides*, *elemFacesConnectingSides*, or *elemConnectingSides*. In this case the targetSide is an optional argument.
- *targetSide* and *numberOfLayers*.

geometrySourceSide
A *Region* of *Face* objects specifying the geometric domain to be used as the source for the sweep meshing operation.

elemFacesSourceSide
A sequence of *MeshFace* objects specifying the faces of 3D elements to be used as the source for the sweep meshing operation.

elemSourceSide
A sequence of 2D *MeshElement* objects specifying the elements to be used as the source for the sweep meshing operation.

geometryConnectingSides
A *Region* of *Face* objects specifying the connecting sides of the sweep meshing operation.

elemFacesConnectingSides
A sequence of *MeshFace* objects specifying connecting sides of the sweep meshing operation.

elemConnectingSides
A sequence of 2D *MeshElement* objects specifying connecting sides of the sweep meshing operation.

targetSide
A *Face* object specifying the target side of the sweep meshing operation.

numberOfLayers
An Int specifying the number of layers to be generated along the sweep direction.

extendElementSets
A Boolean specifying whether existing element sets that include source elements will be extended to also include swept elements. This argument is ignored for native part instances. The default value is False.

Return value
`None.`

Exceptions
None.

`generateBottomUpRevolvedMesh(...)`

This method generates solid elements by revolving a 2D mesh around an axis, either on an orphan mesh or within a cell region using a bottom-up technique.

Required arguments

cell A *Cell* object specifying the geometric region where the mesh is to be generated. This argument is valid only for native part instances.

numberOfLayers An Int specifying the number of layers of elements to be generated around the axis of revolution.

axisOfRevolution A sequence of sequences of Floats specifying the two points of the vector that describes the axis of revolution. Each point is defined by a tuple of three coordinates indicating its position. The direction of the axis of revolution is from the first point to the second point. The orientation of the revolution operation follows the right-hand-rule about the axis of revolution.

angleOfRevolution A Float specifying the angle of revolution.

Optional arguments

At least one of the three optional "SourceSide" arguments must be specified.

geometrySourceSide A *Region* of *Face* objects specifying the geometric domain to be used as the source for the revolve meshing operation.

elemFacesSourceSide A sequence of *MeshFace* objects specifying the faces of 3D elements to be used as the source for the revolve meshing operation.

elemSourceSide A sequence of 2D *MeshElement* objects specifying the elements to be used as the source for the revolve meshing operation.

extendElementSets A Boolean specifying whether existing element sets that include source elements will be extended to also include extruded elements. This argument is ignored for native part instances. The default value is False.

Return value
`None.`

Exceptions
None.

generateMesh(...)

This method generates a mesh in the given part instances or regions.

Required arguments

None.

Optional arguments

regions A sequence of *PartInstance* objects or *Region* objects specifying the part instances or regions where the mesh is to be generated.

seedConstraintOverride A Boolean specifying whether mesh generation is allowed to modify seed constraints. The default value is OFF.

meshTechniqueOverride A Boolean specifying whether mesh generation is allowed to modify the existing mesh techniques so that a compatible mesh can be generated. The default value is OFF.

boundaryPreview A Boolean specifying whether the generated mesh should be a boundary mesh. This option will only have an effect if any of the specified regions are to be meshed with tetrahedral elements or using the bottom-up technique with hexahedral or wedge elements. The default value is OFF.

boundaryMeshOverride A Boolean specifying whether mesh generation is allowed to modify an existing boundary preview mesh. This option will only have an effect if any of the specified regions are to be meshed with tetrahedral elements and a boundary preview mesh already exists. The default value is OFF.

Return value

`None.`

Exceptions

None.

getEdgeSeeds(...)

This method returns an edge seed parameter for a specified edge of an assembly.

Required arguments

edge An *Edge* object specifying the edge to be queried.

attribute A SymbolicConstant specifying the type of edge seed attribute to return. Possible values are:

- EDGE_SEEDING_METHOD
- BIAS_METHOD
- NUMBER

- AVERAGE_SIZE
- DEVIATION_FACTOR
- MIN_SIZE_FACTOR
- BIAS_RATIO
- BIAS_MIN_SIZE
- BIAS_MAX_SIZE
- VERTEX_ADJ_TO_SMALLEST_ELEM
- SMALLEST_ELEM_LOCATION
- CONSTRAINT

The return value is dependent on the *attribute* argument.

- If *attribute*=EDGE_SEEDING_METHOD, the return value is a SymbolicConstant specifying the edge seeding method used to create the seeds along the edge. Possible values are:
  - UNIFORM_BY_NUMBER
  - UNIFORM_BY_SIZE
  - CURVATURE_BASED_BY_SIZE
  - BIASED
  - NONE
- If *attribute*=BIAS_METHOD, the return value is a SymbolicConstant specifying the bias type used to create the seeds along the edge. Possible values are:
  - SINGLE
  - DOUBLE
  - NONE
- If *attribute*=NUMBER, the return value is an Int specifying the number of element seeds along the edge.
- If *attribute*=AVERAGE_SIZE, the return value is a Float specifying the average element size along the edge.
- If *attribute*=DEVIATION_FACTOR, the return value is a Float specifying the deviation factor h/L, where h is the chordal deviation and L is the element length. If edge seeds are not defined, the return value is zero.
- If *attribute*=MIN_SIZE_FACTOR, the return value is a Float specifying the size of the smallest allowable element as a fraction of the specified global element size. If edge seeds are not defined, the return value is zero.
- If *attribute*=BIAS_RATIO, the return value is a Float specifying the length ratio of the largest element to the smallest element.
- If *attribute*=BIAS_MIN_SIZE, the return value is a Float specifying the length of the largest element; only applicable if the EDGE_SEEDING_METHOD is BIASED and seeds were specified by minimum and maximum sizes.
- If *attribute*=BIAS_MAX_SIZE, the return value is a Float specifying the length of the largest element; only applicable if the EDGE_SEEDING_METHOD is BIASED and seeds were specified by minimum and maximum sizes.

- If *attribute*=VERTEX_ADJ_TO_SMALLEST_ELEM, the return value is an Int specifying the ID of the vertex next to the smallest element; only applicable if the EDGE_SEEDING_METHOD is BIASED.
- If *attribute*=SMALLEST_ELEM_LOCATION, the return value is a SymbolicConstant specifying the location of smallest elements for double bias seeds; only applicable if the EDGE_SEEDING_METHOD is BIASED and BIAS_METHOD is DOUBLE. Possible values are:
  - SMALLEST_ELEM_AT_CENTER
  - SMALLEST_ELEM_AT_ENDS
  - NONE
- If *attribute*=CONSTRAINT, the return value is a SymbolicConstant specifying how close the seeds must be matched by the mesh. Possible values are:
  - FREE
  - FINER
  - FIXED
  - NONE

  A value of NONE indicates that the edge is not seeded.

Optional arguments

None.

Return value

The return value is a Float, an Int, or a SymbolicConstant depending on the value of the *attribute* argument.

Exceptions

None.

`getElementType(...)`

This method returns the *ElemType* object of a given element shape assigned to a region of the assembly.

Required arguments

region

A *Cell*, a *Face*, or an *Edge* object specifying the region to be queried.

elemShape

A SymbolicConstant specifying the shape of the element for which to return the element type. Possible values are:

- LINE
- QUAD
- TRI
- HEX
- WEDGE
- TET

Optional arguments

None.

Return value

ElemType object.

Exceptions

TypeError If the region cannot be associated with element types or if the *elemShape* is not consistent with the dimension of the *region*.

`getIncompatibleMeshInterfaces(...)`

This method returns a sequence of face objects that are meshed with incompatible elements.

Required arguments

None.

Optional arguments

cells A sequence of cell objects which will be used to search the incompatible faces.

Return value

A sequence of *Face* objects.

Exceptions

None.

`getMeshControl(...)`

This method returns a mesh control parameter for the specified region of the assembly.

Required arguments

region A *Cell*, a *Face*, or an *Edge* object specifying the region to be queried.

attribute A SymbolicConstant specifying the mesh control attribute to return. Possible values are:

- ELEM_SHAPE
- TECHNIQUE
- ALGORITHM
- MIN_TRANSITION

The return value is dependent on the *attribute* argument.

- If *attribute*=ELEM_SHAPE, the return value is a SymbolicConstant specifying the element shape used during meshing. Possible values are:
  - LINE
  - QUAD
  - TRI
  - QUAD_DOMINATED
  - HEX
  - TET
  - WEDGE
  - HEX_DOMINATED
- If *attribute*=TECHNIQUE, the return value is a SymbolicConstant specifying the meshing technique to be used during meshing. Possible values are:
  - FREE
  - STRUCTURED
  - SWEEP
  - UNMESHABLE

  Where UNMESHABLE indicates that no meshing technique is applicable with the currently assigned element shape.
- If *attribute*=ALGORITHM, the return value is a SymbolicConstant specifying the meshing algorithm to be used during meshing. Possible values are:
  - MEDIAL_AXIS
  - ADVANCING_FRONT
  - DEFAULT
  - NON_DEFAULT
  - NONE

  Where NONE indicates that no algorithm is applicable.
- If *attribute*=MIN_TRANSITION, the return value is a Boolean indicating whether minimum transition will be used during meshing. This option is applicable only to the following:
  - Free quadrilateral meshing or sweep hexahedral meshing with *algorithm*=MEDIAL_AXIS.
  - Structured quadrilateral meshing.

Optional arguments

None.

Return value

The return value is a SymbolicConstant or a Boolean depending on the value of the *attribute* argument.

Exceptions

TypeError	The region cannot carry mesh controls.

getMeshStats(...)

This method returns the mesh statistics for the given part instances or regions.

Required arguments

regions A sequence or tuple of *PartInstance* objects or Geometry regions for which mesh statistics should be returned.

Optional arguments

None.

Return value

A MeshStats object.

Exceptions

None.

getPartSeeds(...)

This method returns a part seed parameter for the specified instance.

Required arguments

region A *PartInstance* object specifying the part instance to be queried.

attribute A SymbolicConstant specifying the type of part seed attribute to return. Possible values are:

- SIZE
- DEFAULT_SIZE
- DEVIATION_FACTOR
- MIN_SIZE_FACTOR

The return value is dependent on the value of the *attribute* argument.

- If *attribute*=SIZE, the return value is a Float specifying the assigned global element size. If part seeds are not defined, the return value is zero.
- If *attribute*=DEFAULT_SIZE, the return value is a Float specifying a suggested default global element size based upon the part geometry.
- If *attribute*=DEVIATION_FACTOR, the return value is a Float specifying the deviation factor h/L, where h is the chordal deviation and L is the element length. If part seeds are not defined, the return value is zero.

- If *attribute*=MIN_SIZE_FACTOR, the return value is a Float specifying the size of the smallest allowable element as a fraction of the specified global element size. If part seeds are not defined, the return value is zero.

Optional arguments

None.

Return value

The return value is a Float, and its value is dependent on the *attribute* argument.

Exceptions

An exception occurs if the part instance does not contain native geometry.	Error: Part instance does not contain native geometry

`getUnmeshedRegions()`

This method returns all geometric regions in the assembly that require a mesh for submitting an analysis but are either unmeshed or are meshed incompletely.

Arguments

None.

Return value

A Region object, or None.

Exceptions

None.

`ignoreEntity(...)`

This method creates a virtual topology feature. Virtual topology allows unimportant entities to be ignored during mesh generation. You can combine two adjacent faces by specifying a common edge to ignore. Similarly, you can combine two adjacent edges by specifying a common vertex to ignore.

Required arguments

entities	A sequence of vertices and edges specifying the entities to be ignored during meshing.

Optional arguments

None.

Return value

A Feature object.

Exceptions

None.

restoreIgnoredEntity(...)

This method restores vertices and edges that have been merged using a virtual topology feature.

Required arguments

entities

A sequence of *IgnoredVertex* objects and *IgnoredEdge* objects specifying the entities to be restored.

Optional arguments

None.

Return value

A Feature object.

Exceptions

None.

seedEdgeByBias(...)

This method seeds the given edges nonuniformly using the specified number of elements and bias ratio or the specified minimum and maximum element sizes.

Required arguments

biasMethod

A SymbolicConstant specifying whether single- or double-biased seed distribution will be applied. If unspecified, single-biased seed distribution will be applied. Possible values are:

- SINGLE: Single-biased seed distribution will be applied.
- DOUBLE: Double-biased seed distribution will be applied.

end1Edges

A sequence of *Edge* objects specifying the edges to seed. The smallest elements will be positioned near the end where the normalized curve parameter=0.0. You must provide either the *end1Edges* or the *end2Edges* argument or both when *biasMethod*=SINGLE and omit both of them when *biasMethod*=DOUBLE.

Note:

You can determine which end is which by the order of the vertex indices returned by *getVertices()*.

end2Edges

A sequence of *Edge* objects specifying the edges to seed. The smallest elements will be positioned near the end where the normalized curve parameter=1.0.

centerEdges A sequence of *Edge* objects specifying the edges to seed. The smallest elements will be positioned near edge center. You must provide either the *centerEdges* or the *endEdges* argument or both when *biasMethod*=DOUBLE and omit both of them when *biasMethod*=SINGLE.

endEdges A sequence of *Edge* objects specifying the edges to seed. The smallest elements will be positioned near edge ends.

ratio A Float specifying the ratio of the largest element to the smallest element. Possible values are $1.0 \leq ratio \leq 10^6$.

number An Int specifying the number of elements along each edge. Possible values are $1 \leq number \leq 10^4$.

minSize A Float specifying the desired smallest element size.

maxSize A Float specifying the desired largest element size.

Note:

You must specify either the *ratio* and *number* or *minSize* and *maxSize* pair of arguments.

Optional arguments

constraint A SymbolicConstant specifying how closely the seeds must be matched by the mesh. The default value is FREE. If unspecified, the existing constraint will remain unchanged. Possible values are:

- FREE: The resulting mesh can be finer or coarser than the specified seeds.
- FINER: The resulting mesh can be finer than the specified seeds.
- FIXED: The seeds must be exactly matched by the mesh (only with respect to the number of elements, not to the nodal positioning).

Return value

`None.`

Exceptions

None.

`seedEdgeByNumber(...)`

This method seeds the given edges uniformly based on the number of elements along the edges.

Required arguments

edges A sequence of *Edge* objects specifying the edges to seed.

number

An Int specifying the number of elements along each edge. Possible values are $1 \leq number \leq 10^4$.

Optional arguments

constraint

A SymbolicConstant specifying how closely the seeds must be matched by the mesh. The default value is FREE. If unspecified, the existing constraint will remain unchanged. Possible values are:

- FREE: The resulting mesh can be finer or coarser than the specified seeds.
- FINER: The resulting mesh can be finer than the specified seeds.
- FIXED: The seeds must be exactly matched by the mesh (only with respect to the number of elements, not to the nodal positioning).

Return value

`None.`

Exceptions

None.

`seedEdgeBySize(...)`

This method seeds the given edges either uniformly or following edge curvature distribution, based on the desired element size.

Required arguments

edges

A sequence of *Edge* objects specifying the edges to seed.

size

A Float specifying the desired element size.

Optional arguments

deviationFactor

A Float specifying the deviation factor h/L, where h is the chordal deviation and L is the element length.

minSizeFactor

A Float specifying the size of the smallest allowable element as a fraction of the specified global element size.

constraint

A SymbolicConstant specifying how closely the seeds must be matched by the mesh. The default value is FREE. If unspecified, the existing constraint will remain unchanged. Possible values are:

- FREE: The resulting mesh can be finer or coarser than the specified seeds.
- FINER: The resulting mesh can be finer than the specified seeds.
- FIXED: The seeds must be exactly matched by the mesh (only with respect to the number of elements, not to the nodal positioning).

Return value
`None.`

Exceptions
None.

seedPartInstance(...)

This method assigns global edge seeds to the given part instances.

Required arguments

regions A sequence of *PartInstance* objects specifying the part instances to seed.

size A Float specifying the desired global element size for the edges.

Optional arguments

deviationFactor A Float specifying the deviation factor h/L, where h is the chordal deviation and L is the element length.

minSizeFactor A Float specifying the size of the smallest allowable element as a fraction of the specified global element size.

constraint A SymbolicConstant specifying how closely the seeds must be matched by the mesh. The default value is FREE. If unspecified, the existing constraint will remain unchanged. Possible values are:

- FREE: The resulting mesh can be finer or coarser than the specified seeds.
- FINER: The resulting mesh can be finer than the specified seeds.

Return value
`None.`

Exceptions
None.

setBoundaryLayerControls(...)

This method sets the control parameters for boundary layer mesh for the specified regions.

Required arguments

regions A sequence of *Cell* objects specifying the regions for which to set the boundary layer mesh control parameters.

firstElemSize

A Float specifying the height of the first element layer off boundary. Possible values are $0.0 < firstElemSize \leq 10^6$.

growthFactor

A Float specifying the ratio of heights of any two consecutive element layers. Possible values are $1.0 \leq growthFactor \leq 10.0$.

numLayers

An Int specifying the number of element layers to be generated. Possible values are $1 \leq numLayers \leq 10^4$.

Optional arguments

inactiveFaces

A sequence of *Face* objects specifying the faces where boundary layer should not be generated. By default, boundary layer mesh will be generated on all faces of the selected regions.

setName

A String specifying a unique name for a set that will contain boundary layer elements.

Return value

`None.`

Exceptions

None.

`setElementType(...)`

This method assigns element types to the specified regions.

Required arguments

regions

A sequence of Geometry regions or *MeshElement* objects, or a Set object containing either geometry regions or elements, specifying the regions to which element types are to be assigned.

elemTypes

A sequence of ElemType objects, one for each element shape applicable to the regions.

Note:

If an ElemType object has an UNKNOWN_*xxx* value for *elemCode*, its order will be deduced from the order of other valid ElemType objects within the same `setElementType` command. If no valid ElemType objects can be found, the order will remain unchanged.

Optional arguments

None.

Return value

`None.`

Exceptions

As a result of the element assignment, a region must have the same library, family, and order for all its assigned element types. Otherwise, an exception will be thrown.

For example, suppose the Hex, Wedge, and Tet elements previously assigned to a cell are all linear. The user now constructs an ElemType object with a quadratic Hex element and includes only this object in the `setElementType` command. An exception will be thrown because the Wedge and Tet elements will remain linear (i.e., As Is) and become incompatible with the newly assigned quadratic Hex element.

`setLogicalCorners(...)`

This method sets the logical corners for a mappable face region.

Required arguments

region A Face region.

corners Three, four, or five Vertex objects defining the logical corners for a given mappable face region.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`setMeshControls(...)`

This method sets the mesh control parameters for the specified regions.

Required arguments

regions A sequence of Face or Cell regions specifying the regions for which to set the mesh control parameters.

Optional arguments

elemShape A SymbolicConstant specifying the element shape to be used for meshing. The default value is QUAD for Face regions and HEX for Cell regions. If unspecified, the existing element shape will remain unchanged. Possible values are:

- QUAD: Quadrilateral mesh.
- QUAD_DOMINATED: Quadrilateral-dominated mesh.
- TRI: Triangular mesh.
- HEX: Hexahedral mesh.

- HEX_DOMINATED: Hex-dominated mesh.
- TET: Tetrahedral mesh.
- WEDGE: Wedge mesh.

technique

A SymbolicConstant specifying the mesh technique to be used. The default value is FREE for Face regions. For Cell regions the initial value depends on the geometry of the regions and can be STRUCTURED, SWEEP, or "unmeshable." If unspecified, the existing mesh technique(s) will remain unchanged. Possible values are:

- FREE: Free mesh technique.
- STRUCTURED: Structured mesh technique.
- SWEEP: Sweep mesh technique.
- BOTTOM_UP: Bottom-up mesh technique. Only applicable for cell regions.
- SYSTEM_ASSIGN: Allow the system to assign a suitable technique. The actual technique assigned can be STRUCTURED, SWEEP, or "unmeshable."

algorithm

A SymbolicConstant specifying the algorithm used to generate the mesh for the specified regions. Possible values are MEDIAL_AXIS, ADVANCING_FRONT, and NON_DEFAULT. If unspecified, the existing value will remain unchanged. This option is applicable only to the following:

- Free quadrilateral or quadrilateral-dominated meshing. In this case the possible values are MEDIAL_AXIS and ADVANCING_FRONT.
- Sweep hexahedral or hexahedral-dominated meshing. In this case the possible values are MEDIAL_AXIS and ADVANCING_FRONT.
- Free tetrahedral meshing. In this case the only possible value is NON_DEFAULT, and it indicates that the free tetrahedral-meshing technique available in Abaqus 6.4 or earlier will be used. If algorithm is not specified, the default tetrahedral-meshing technique will be used.

minTransition

A Boolean specifying whether minimum transition is to be applied. The default value is ON. If unspecified, the existing value will remain unchanged. This option is applicable only in the following cases:

- Free quadrilateral meshing or hexahedral sweep meshing with *algorithm*=MEDIAL_AXIS.
- Structured quadrilateral meshing.

sizeGrowth

A SymbolicConstant specifying element size growth to be applied when generating the interior of a tetrahedral mesh. Possible values are MODERATE and MAXIMUM. If unspecified, the existing value will remain unchanged. This option only applies to the default tetrahedral mesher.

allowMapped

A Boolean specifying whether mapped meshing can be used to replace the selected mesh technique. The *allowMapped* argument is applicable only in the following cases:

- Free triangular meshing.
- Free quadrilateral or quadrilateral-dominated meshing with *algorithm*=ADVANCING_FRONT.
- Hexahedral or hexahedral-dominated sweep meshing with *algorithm*=ADVANCING_FRONT.
- Free tetrahedral meshing. *allowMapped*=True implies that mapped triangular meshing can be used on faces that bound three-dimensional *regions*.

Return value
`None.`

Exceptions
None.

`setSweepPath(...)`

This method sets the sweep path for a sweepable region or the revolve path for a revolvable region.

Required arguments

region A sweepable region.

edge An *Edge* object specifying the sweep or revolve path.

sense A SymbolicConstant specifying the sweep sense. The sense will affect only how gasket elements will be created; it will have no effect if gasket elements are not used. Possible values are FORWARD or REVERSE.

If *sense*=FORWARD, the sense of the given edge's underlying curve will be used.

Optional arguments
None.

Return value
`None.`

Exceptions
None.

`verifyMeshQuality(...)`

This method tests the quality of part instance meshes and returns poor-quality elements.

Required arguments

criterion A SymbolicConstant specifying the criterion used for the quality check. Possible values are:

ANALYSIS_CHECKS

When this criterion is specified Abaqus/CAE will invoke the element quality checks included with the input file processor for Abaqus/Standard and Abaqus/Explicit.

ANGULAR_DEVIATION

The maximum amount (in degrees) that an element's face corner angles deviate from the ideal angle. The ideal angle is 90° for quadrilateral element faces and 60° for triangular element faces. Elements with an angular deviation larger than the specified threshold will fail this test.

ASPECT_RATIO

The ratio between the lengths of the longest and shortest edges of an element. Elements with an aspect ratio larger than the specified threshold will fail this test.

GEOM_DEVIATION_FACTOR

The largest geometric deviation factor evaluated along any of the element edges associated with geometric edges or faces. The geometric deviation factor along an element edge is calculated by dividing the maximum gap between the element edge and its associated geometry by the length of the element edge. Elements with a geometric deviation factor larger than the specified threshold will fail this test.

LARGE_ANGLE

The largest corner angle on any of an element's faces. Elements with face angles larger than the specified threshold (in degrees) will fail this test.

LONGEST_EDGE

The length of an element's longest edge. Elements with an edge longer than the specified threshold will fail this test.

MAX_FREQUENCY

An estimate of an element's contribution to the initial maximum allowable frequency for Abaqus/Standard analyses. This calculation requires appropriate section assignments and material definitions. Elements whose maximum allowable frequency is smaller than the given value will fail this test.

SHAPE_FACTOR

The shape factor for triangular and tetrahedral elements. This is the ratio between the element area or volume and the optimal element area or volume. Elements with a shape factor smaller than the specified threshold will fail this test.

SHORTEST_EDGE

The length of an element's shortest edge. Elements with an edge shorter than the specified threshold will fail this test.

SMALL_ANGLE

The smallest corner angle on any of an element's faces. Elements with face angles smaller than the given value (in degrees) will fail this test.

STABLE_TIME_INCREMENT

An estimate of an element's contribution to the initial maximum stable time increment for Abaqus/Explicit analyses. This calculation requires appropriate section assignments and material definitions. Elements that require a time increment smaller than the given value will fail this test.

Optional arguments

threshold

A Float value used to determine low quality elements according to the specified criterion. This argument is ignored when the ANALYSIS_CHECKS criterion is used. For other criterion, if this argument is unspecified then no list of failed elements will be returned.

elemShape

A SymbolicConstant specifying an element shape for limiting the query. Possible values are LINE, QUAD, TRI, HEX, WEDGE, and TET.

regions

A sequence of *Region* or *MeshElement* objects. If you do not specify the *regions* argument, all meshes in the assembly are considered.

Return value

A Dictionary object containing values for some number of the following keys: failedElements, warningElements, naElements (sequences of *MeshElement* objects); numElements (Int); average, worst (Float); worstElement (*MeshElement* object)

Exceptions

None.

Part object

The following commands operate on Part objects. For more information about the Part object, see *Part object*.

Access

```
import mesh
```

assignStackDirection(...)

This method assigns a stack direction to geometric cells. The stack direction will be used to orient the elements during mesh generation.

Required arguments

cells A sequence of *Cell* objects specifying regions where to assign the stack direction.

referenceRegion A *Face* object specifying the top side of the stack direction.

Optional arguments

None.

Return value

None.

Exceptions

None.

associateMeshWithGeometry(...)

This method associates a geometric entity with mesh entities that are either orphan elements, bounds orphan elements, or were created using the bottom-up meshing technique.

Required arguments

geometricEntity A *Cell*, a *Face*, an *Edge*, or a *Vertex* object specifying geometric entity to be associated with one or more mesh entities.

If the geometric entity is a *Cell* object then the argument *elements* must be specified.

If the geometric entity is a *Face* object then the argument *elemFaces* must be specified.

If the geometric entity is an *Edge* object then the argument *elemEdges* must be specified.

If the geometric entity is a *Vertex* object then the argument *node* must be specified.

Optional arguments

elements A sequence of *MeshElement* objects specifying the elements to be associated with the geometric cell.

elemFaces A sequence of *MeshFace* objects specifying the element faces to be associated with the geometric face.

elemEdges A sequence of *MeshEdge* objects specifying the element edges to be associated with the geometric edge.

node A *MeshNode* object specifying the mesh node to be associated with the geometric vertex.

Return value

`None.`

Exceptions

None.

`createVirtualTopology(...)`

This method creates a virtual topology feature by automatically merging faces and edges based on a set of geometric parameters. The edges and vertices that are being merged will be ignored during mesh generation.

Required arguments

None.

Optional arguments

regions A sequence of *Face* objects specifying the domain to search for geometric entities that need to be merged. Entities identified as candidates to be merged may be merged with entities from outside the specified region. If *regions* is not specified then the entire part is the domain for searching geometric entities that need to be merged.

mergeShortEdges A Boolean specifying whether to merge short edges. The default value is False.

shortEdgeThreshold A Float specifying a threshold that determines which edges are considered to be short. These edges are the candidate entities to be merged. This argument is a required argument if the argument*mergeShortEdges* equals True and it is ignored if the argument *mergeShortEdges* equals False.

mergeSmallFaces A Boolean specifying whether to merge faces with small area. The default value is False.

smallFaceAreaThreshold A Float specifying a threshold that determines which faces are considered to have a small area. These faces are the candidate entities to be merged. This argument is a required argument if the argument*mergeSmallFaces* equals True and it is ignored if the argument *mergeSmallFaces* equals False.

mergeSliverFaces A Boolean specifying whether to merge faces with high aspect ratio. The default value is False.

faceAspectRatioThreshold
A Float specifying a threshold that determines which faces are considered to have high aspect ratio. These faces are the candidate entities to be merged. This argument is a required argument if the argument*mergeSliverFaces* equals True and it is ignored if the argument *mergeSliverFaces* equals False.

mergeSmallAngleFaces
A Boolean specifying whether to merge faces that have a sharp corner angle. The default value is False.

smallFaceCornerAngleThreshold
A Float specifying a threshold that determines which face corner angles are considered to be small. These faces will be candidate entities to be merged. This argument is a required argument if the argument*mergeSmallAngleFaces* equals True and it is ignored if the argument *mergeSmallAngleFaces* equals False.

mergeThinStairFaces
A Boolean specifying whether to merge faces that represent a thin stair-like feature. The default value is False.

thinStairFaceThreshold
A Float specifying a threshold that determines which faces representing small stair-like features are considered thin. These faces will be candidate entities to be merged. This argument is required if the argument *mergeThinStairFaces* is True and it is ignored if *mergeThinStairFaces* is False.

ignoreRedundantEntities
A Boolean specifying whether to abstract away redundant edges and vertices. The default value is False.

cornerAngleTolerance
A Float specifying the angle deviation from 180 degrees at a vertex or at an edge such that the two edges radiating from the vertex or the two faces bounded by the edge can be merged. The default value is 30.0 degrees.

applyBlendControls
A Boolean specifying whether to verify that blend faces can be merged with neighboring faces. If *applyBlendControls* is true then all faces that have angle larger than *blendSubtendedAngleTolerance* and a radius smaller than *blendRadiusTolerance* will not be merged with neighboring faces unless the neighboring faces are also blend faces with similar geometric characteristics. The default value is False.

blendSubtendedAngleTolerance
A Float specifying the largest subtended angle of blend faces that can be merged with neighboring faces. This argument is a required argument if the argument *applyBlendControls* equals True and it is ignored if the argument *applyBlendControls* equals False.

blendRadiusTolerance
A Float specifying the smallest radius of curvature of blend faces that can be merged with neighboring faces. This argument is a required argument if the argument *applyBlendControls* equals True and it is ignored if the argument *applyBlendControls* equals False.

Return value

A Feature object.

Exceptions

None.

deleteBoundaryLayerControls(...)

This method deletes the control parameters for boundary layer mesh for all the specified regions.

Required arguments

regions A sequence of *Cell* objects specifying the regions for which to set the boundary layer mesh control parameters.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

deleteMesh(...)

This method deletes a subset of the mesh that contains the native elements from the given parts or regions.

Required arguments

regions A sequence of Part objects or *Region* objects specifying the parts or regions from which the native mesh is to be deleted.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

deleteMeshAssociationWithGeometry(...)

This method deletes the association of geometric entities with mesh entities.

Required arguments

geometricEntities A sequence of *Cell* objects, *Face* objects, *Edge* objects, or *Vertex* objects specifying the geometric entities that will be disassociated from the mesh.

Optional arguments

addBoundingEntities A Boolean specifying whether the mesh will also be disassociated from the geometric entities that bounds the given *geometricEntities*. For example, if the argument *geometricEntities* contains a face, this boolean indicates whether the edges and vertices that bound the face will also be disassociated from the mesh. The default value is False.

Return value

`None.`

Exceptions

None.

`deletePreviewMesh()`

This method deletes all boundary meshes in the parts. See the *boundaryPreview* argument of `generateMesh` for information about generating boundary meshes.

Arguments

None.

Return value

`None.`

Exceptions

None.

`deleteSeeds(...)`

This method deletes the global edge seeds from the given parts or deletes the local edge seeds from the given edges.

Required arguments

regions A sequence of Part objects or Edge objects specifying the parts or edges from which the seeds are to be deleted.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

generateMesh(...)

This method generates a mesh in the given parts or regions.

Required arguments

None.

Optional arguments

regions A sequence of Part objects or *Region* objects specifying the parts or regions where the mesh is to be generated.

seedConstraintOverride A Boolean specifying whether mesh generation is allowed to modify seed constraints. The default value is OFF.

meshTechniqueOverride A Boolean specifying whether mesh generation is allowed to modify the existing mesh techniques so that a compatible mesh can be generated. The default value is OFF.

boundaryPreview A Boolean specifying whether the generated mesh should be a boundary preview mesh. This option will only have an effect if any of the specified regions are to be meshed with tetrahedral elements or using the bottom-up technique with hexahedral or wedge elements. The default value is OFF.

boundaryMeshOverride A Boolean specifying whether mesh generation is allowed to modify an existing boundary preview mesh. This option will only have an effect if any of the specified regions are to be meshed with tetrahedral elements and a boundary preview mesh already exists. The default value is OFF.

Return value

`None.`

Exceptions

None.

generateBottomUpExtrudedMesh(...)

This method generates solid elements by extruding a 2D mesh along a vector, either on an orphan mesh or within a cell region using a bottom-up technique.

Required arguments

cell A *Cell* object specifying the geometric region where the mesh is to be generated. This argument is valid only for native parts.

numberOfLayers An Int specifying the number of layers to be generated along the extrusion vector.

extrudeVector
A sequence of sequences of Floats specifying the start point and end point of a vector. Each point is defined by a tuple of three coordinates indicating its position. The direction of the mesh extrusion operation is from the first point to the second point.

Optional arguments

At least one of the three optional "SourceSide" arguments must be specified.

geometrySourceSide
A *Region* of *Face* objects specifying the geometric domain to be used as the source for the extrude meshing operation.

elemFacesSourceSide
A sequence of *MeshFace* objects specifying the faces of 3D elements to be used as the source for the extrude meshing operation.

elemSourceSide
A sequence of 2D *MeshElement* objects specifying the elements to be used as the source for the extrude meshing operation.

depth
A Float specifying the distance of the mesh extrusion. If unspecified, the vector length of the *extrudeVector* argument is assumed.

targetSide
A datum plane, a sequence of *Face* objects, a sequence of *MeshFace* objects, or a sequence of 2D *MeshElement* objects specifying the target of the extrude meshing operation. If specified, this argument overrides the *depth* argument, and all points on the source will be extruded in the direction of the extrusion vector until meeting the target.

biasRatio
A Float specifying a ratio of the element size in the extrusion direction between the source and the target sides of the extrusion. The default is 1.0, meaning no bias.

extendElementSets
A Boolean specifying whether existing element sets that include source elements will be extended to also include extruded elements. This argument is ignored for native parts. The default value is False.

Return value

`None.`

Exceptions

None.

`generateBottomUpSweptMesh(...)`

This method generates solid elements by sweeping a 2D mesh, either on an orphan mesh or within a cell region using a bottom-up technique.

Required arguments

cell
A *Cell* object specifying the geometric region where the mesh is to be generated. This argument is valid only for native parts.

Optional arguments

At least one of the following three arguments must be specified: *geometrySourceSide*, *elemFacesSourceSide*, or *elemSourceSide*.

In addition one of the following two sets of arguments must also be specified:

- One of the following three arguments: *geometryConnectingSides*, *elemFacesConnectingSides*, or *elemConnectingSides*. In this case the targetSide is an optional argument.
- *targetSide* and *numberOfLayers*.

geometrySourceSide
A *Region* of *Face* objects specifying the geometric domain to be used as the source for the sweep meshing operation.

elemFacesSourceSide
A sequence of *MeshFace* objects specifying the faces of 3D elements to be used as the source for the sweep meshing operation.

elemSourceSide
A sequence of 2D *MeshElement* objects specifying the elements to be used as the source for the sweep meshing operation.

geometryConnectingSides
A *Region* of *Face* objects specifying connecting sides of the sweep meshing operation.

elemFacesConnectingSides
A sequence of *MeshFace* objects specifying connecting sides of the sweep meshing operation.

elemConnectingSides
A sequence of 2D *MeshElement* objects specifying connecting sides of the sweep meshing operation.

targetSide
A *Face* object specifying the target side of the sweep meshing operation.

numberOfLayers
An Int specifying the number of layers to be generated along the sweep direction.

extendElementSets
A Boolean specifying whether existing element sets that include source elements will be extended to also include swept elements. This argument is ignored for native parts. The default value is False.

Return value

`None.`

Exceptions

None.

`generateBottomUpRevolvedMesh(...)`

This method generates solid elements by revolving a 2D mesh around an axis, either on an orphan mesh or within a cell region using a bottom-up technique.

Required arguments

cell A *Cell* object specifying the geometric region where the mesh is to be generated. This argument is valid only for native parts.

numberOfLayers An Int specifying the number of layers of elements to be generated around the axis of revolution.

axisOfRevolution A sequence of sequences of Floats specifying the two points of the vector that describes the axis of revolution. Each point is defined by a tuple of three coordinates indicating its position. The direction of the axis of revolution is from the first point to the second point. The orientation of the revolution operation follows the right-hand-rule about the axis of revolution.

angleOfRevolution A Float specifying the angle of revolution.

Optional arguments

At least one of the three optional "SourceSide" arguments must be specified.

geometrySourceSide A *Region* of *Face* objects specifying the geometric domain to be used as the source for the revolve meshing operation.

elemFacesSourceSide A sequence of *MeshFace* objects specifying the faces of 3D elements to be used as the source for the revolve meshing operation.

elemSourceSide A sequence of 2D *MeshElement* objects specifying the elements to be used as the source for the revolve meshing operation.

extendElementSets A Boolean specifying whether existing element sets that include source elements will be extended to also include extruded elements. This argument is ignored for native parts. The default value is False.

Return value

`None.`

Exceptions

None.

`getEdgeSeeds(...)`

This method returns an edge seed parameter for a specified edge of a part.

Required arguments

edge An *Edge* object specifying the edge to be queried.

attribute A SymbolicConstant specifying the type of edge seed attribute to return. Possible values are:

- EDGE_SEEDING_METHOD
- BIAS_METHOD
- NUMBER
- AVERAGE_SIZE
- DEVIATION_FACTOR
- MIN_SIZE_FACTOR
- BIAS_RATIO
- BIAS_MIN_SIZE
- BIAS_MAX_SIZE
- VERTEX_ADJ_TO_SMALLEST_ELEM
- SMALLEST_ELEM_LOCATION
- CONSTRAINT

The return value is dependent on the *attribute* argument.

- If *attribute*=EDGE_SEEDING_METHOD, the return value is a SymbolicConstant specifying the edge seeding method used to create the seeds along the edge. Possible values are:
  - UNIFORM_BY_NUMBER
  - UNIFORM_BY_SIZE
  - CURVATURE_BASED_BY_SIZE
  - BIASED
  - NONE
- If *attribute*=BIAS_METHOD, the return value is a SymbolicConstant specifying the bias type used to create the seeds along the edge. Possible values are:
  - SINGLE
  - DOUBLE
  - NONE
- If *attribute*=NUMBER, the return value is an Int specifying the number of element seeds along the edge.
- If *attribute*=AVERAGE_SIZE, the return value is a Float specifying the average element size along the edge.
- If *attribute*=DEVIATION_FACTOR, the return value is a Float specifying the deviation factor h/L, where h is the chordal deviation and L is the element length. If edge seeds are not defined, the return value is zero.
- If *attribute*=MIN_SIZE_FACTOR, the return value is a Float specifying the size of the smallest allowable element as a fraction of the specified global element size. If edge seeds are not defined, the return value is zero.
- If *attribute*=BIAS_RATIO, the return value is a Float specifying the length ratio of the largest element to the smallest element.
- If *attribute*=BIAS_MIN_SIZE, the return value is a Float specifying the length of the largest element; only applicable if the EDGE_SEEDING_METHOD is BIASED and seeds were specified by minimum and maximum sizes.

- If *attribute*=BIAS_MAX_SIZE, the return value is a Float specifying the length of the largest element; only applicable if the EDGE_SEEDING_METHOD is BIASED and seeds were specified by minimum and maximum sizes.
- If *attribute*=VERTEX_ADJ_TO_SMALLEST_ELEM, the return value is an Int specifying the ID of the vertex next to the smallest element; only applicable if the EDGE_SEEDING_METHOD is BIASED.
- If *attribute*=SMALLEST_ELEM_LOCATION, the return value is a SymbolicConstant specifying the location of smallest elements for double bias seeds; only applicable if the EDGE_SEEDING_METHOD is BIASED and BIAS_METHOD is DOUBLE. Possible values are:
  - SMALLEST_ELEM_AT_CENTER
  - SMALLEST_ELEM_AT_ENDS
  - NONE
- If *attribute*=CONSTRAINT, the return value is a SymbolicConstant specifying how close the seeds must be matched by the mesh. Possible values are:
  - FREE
  - FINER
  - FIXED
  - NONE

  A value of NONE indicates that the edge is not seeded.

Optional arguments

None.

Return value

The return value is a Float, an Int, or a SymbolicConstant depending on the value of the *attribute* argument.

Exceptions

None.

`getElementType(...)`

This method returns the *ElemType* object of a given element shape assigned to a region of a part.

Required arguments

region

A *Cell*, a *Face*, or an *Edge* object specifying the region to be queried.

elemShape

A SymbolicConstant specifying the shape of the element for which to return the element type. Possible values are:

- LINE
- QUAD
- TRI

- HEX
- WEDGE
- TET

Optional arguments

None.

Return value

ElemType object.

Exceptions

TypeError The region cannot be associated with element types or the *elemShape* is not consistent with the dimension of the *region*.

`getIncompatibleMeshInterfaces(...)`

This method returns a sequence of face objects that are meshed with incompatible elements.

Required arguments

None.

Optional arguments

cells A sequence of cell objects which will be used to search the incompatible faces.

Return value

A sequence of *Face* objects.

Exceptions

None.

`getMeshControl(...)`

This method returns a mesh control parameter for the specified region of a part.

Required arguments

region A *Cell*, a *Face*, or an *Edge* object specifying the region to be queried.

attribute A SymbolicConstant specifying the mesh control attribute to return. Possible values are:

- ELEM_SHAPE
- TECHNIQUE

- ALGORITHM
- MIN_TRANSITION

The return value depends on the value of the *attribute* argument.

- If *attribute*=ELEM_SHAPE, the return value is a SymbolicConstant specifying the element shape used during meshing. Possible values are:
  - LINE
  - QUAD
  - TRI
  - QUAD_DOMINATED
  - HEX
  - TET
  - WEDGE
  - HEX_DOMINATED
- If *attribute*=TECHNIQUE, the return value is a SymbolicConstant specifying the meshing technique to be used during meshing. Possible values are:
  - FREE
  - STRUCTURED
  - SWEEP
  - UNMESHABLE

  Where UNMESHABLE indicates that no meshing technique is applicable with the currently assigned element shape.
- If *attribute*=ALGORITHM, the return value is a SymbolicConstant specifying the meshing algorithm to be used during meshing. Possible values are:
  - MEDIAL_AXIS
  - ADVANCING_FRONT
  - DEFAULT
  - NON_DEFAULT
  - NONE

  Where NONE indicates that no algorithm is applicable.
- If *attribute*=MIN_TRANSITION, the return value is a Boolean indicating whether minimum transition will be used during meshing. This option is applicable only to the following:
  - Free quadrilateral meshing or sweep hexahedral meshing with *algorithm*=MEDIAL_AXIS.
  - Structured quadrilateral meshing.

Optional arguments

None.

Return value

The return value is a SymbolicConstant or a Boolean depending on the value of the *attribute* argument.

Exceptions

TypeError The region cannot carry mesh controls.

getMeshStats(...)

This method returns the mesh statistics for the given regions.

Required arguments

regions A sequence or tuple of Geometry regions for which mesh statistics should be returned.

Optional arguments

None.

Return value

A MeshStats object.

Exceptions

None.

getPartSeeds(...)

This method returns a part seed parameter for the part.

Required arguments

attribute A SymbolicConstant specifying the type of part seed attribute to return. Possible values are:

- SIZE
- DEFAULT_SIZE
- DEVIATION_FACTOR
- MIN_SIZE_FACTOR

The return value depends on the value of the *attribute* argument.

- If *attribute*=SIZE, the return value is a Float specifying the assigned global element size. If part seeds are not defined, the return value is zero.
- If *attribute*=DEFAULT_SIZE, the return value is a Float specifying a suggested default global element size based upon the part geometry.
- If *attribute*=DEVIATION_FACTOR, the return value is a Float specifying the deviation factor h/L, where h is the chordal deviation and L is the element length. If part seeds are not defined, the return value is zero.

- If *attribute*=MIN_SIZE_FACTOR, the return value is a Float specifying the size of the smallest allowable element as a fraction of the specified global element size. If part seeds are not defined, the return value is zero.

Optional arguments

None.

Return value

The return value is a Float that depends on the value of the *attribute* argument.

Exceptions

An exception occurs if the part does not contain native geometry.	Error: Part does not contain native geometry

`getUnmeshedRegions()`

This method returns all geometric regions in the part that require a mesh for submitting an analysis but are either unmeshed or are meshed incompletely.

Arguments

None.

Return value

A Region object, or None.

Exceptions

None.

`ignoreEntity(...)`

This method creates a virtual topology feature. Virtual topology allows unimportant entities to be ignored during mesh generation. You can combine two adjacent faces by specifying a common edge to ignore. Similarly, you can combine two adjacent edges by specifying a common vertex to ignore.

Required arguments

entities	A sequence of vertices and edges specifying the entities to be ignored during meshing.

Optional arguments

None.

Return value

A Feature object.

Exceptions

None.

restoreIgnoredEntity(...)

This method restores vertices and edges that have been merged using a virtual topology feature.

Required arguments

entities

A sequence of *IgnoredVertex* objects and *IgnoredEdge* objects specifying the entities to be restored.

Optional arguments

None.

Return value

A Feature object.

Exceptions

None.

seedEdgeByBias(...)

This method seeds the given edges nonuniformly using the specified number of elements and bias ratio or the specified minimum and maximum element sizes.

Required arguments

biasMethod

A SymbolicConstant specifying whether single- or double-biased seed distribution will be applied. If unspecified, single-biased seed distribution will be applied. Possible values are:

- SINGLE: Single-biased seed distribution will be applied.
- DOUBLE: Double-biased seed distribution will be applied.

end1Edges

A sequence of *Edge* objects specifying the edges to seed. The smallest elements will be positioned near the end where the normalized curve parameter=0.0. You must provide either the *end1Edges* or the *end2Edges* argument or both when *biasMethod*=SINGLE and omit both of them when *biasMethod*=DOUBLE.

Note:

You can determine which end is which by the order of the vertex indices returned by *getVertices()*.

end2Edges

A sequence of *Edge* objects specifying the edges to seed. The smallest elements will be positioned near the end where the normalized curve parameter=1.0.

centerEdges A sequence of *Edge* objects specifying the edges to seed. The smallest elements will be positioned near edge center. You must provide either the *centerEdges* or the *endEdges* argument or both when *biasMethod*=DOUBLE and omit both of them when *biasMethod*=SINGLE.

endEdges A sequence of *Edge* objects specifying the edges to seed. The smallest elements will be positioned near edge ends.

ratio A Float specifying the ratio of the largest element to the smallest element. Possible values are $1.0 \leq ratio \leq 10^6$.

number An Int specifying the number of elements along each edge. Possible values are $1 \leq number \leq 10^4$.

minSize A Float specifying the desired smallest element size.

maxSize A Float specifying the desired largest element size.

Note:

You must specify either the *ratio* and *number* or *minSize* and *maxSize* pair of arguments.

Optional arguments

constraint A SymbolicConstant specifying how closely the seeds must be matched by the mesh. The default value is FREE. If unspecified, the existing constraint will remain unchanged. Possible values are:

- FREE: The resulting mesh can be finer or coarser than the specified seeds.
- FINER: The resulting mesh can be finer than the specified seeds.
- FIXED: The seeds must be exactly matched by the mesh (only with respect to the number of elements, not to the nodal positioning).

Return value

`None.`

Exceptions

None.

`seedEdgeByNumber(...)`

This method seeds the given edges uniformly based on the number of elements along the edges.

Required arguments

edges A sequence of *Edge* objects specifying the edges to seed.

number

An Int specifying the number of elements along each edge. Possible values are $1 \leq number \leq 10^4$.

Optional arguments

constraint

A SymbolicConstant specifying how closely the seeds must be matched by the mesh. The default value is FREE. If unspecified, the existing constraint will remain unchanged. Possible values are:

- FREE: The resulting mesh can be finer or coarser than the specified seeds.
- FINER: The resulting mesh can be finer than the specified seeds.
- FIXED: The seeds must be exactly matched by the mesh (only with respect to the number of elements, not to the nodal positioning).

Return value

`None.`

Exceptions

None.

`seedEdgeBySize(...)`

This method seeds the given edges either uniformly or following edge curvature distribution, based on the desired element size.

Required arguments

edges

A sequence of *Edge* objects specifying the edges to seed.

size

A Float specifying the desired element size.

Optional arguments

deviationFactor

A Float specifying the deviation factor h/L, where h is the chordal deviation and L is the element length.

minSizeFactor

A Float specifying the size of the smallest allowable element as a fraction of the specified global element size.

constraint

A SymbolicConstant specifying how closely the seeds must be matched by the mesh. The default value is FREE. If unspecified, the existing constraint will remain unchanged. Possible values are:

- FREE: The resulting mesh can be finer or coarser than the specified seeds.
- FINER: The resulting mesh can be finer than the specified seeds.
- FIXED: The seeds must be exactly matched by the mesh (only with respect to the number of elements, not to the nodal positioning).

Return value
`None.`

Exceptions
None.

`seedPart(...)`

This method assigns global edge seeds to the given parts.

Required arguments

size A Float specifying the desired global element size for the edges.

Optional arguments

deviationFactor A Float specifying the deviation factor h/L, where h is the chordal deviation and L is the element length.

minSizeFactor A Float specifying the size of the smallest allowable element as a fraction of the specified global element size.

constraint A SymbolicConstant specifying how closely the seeds must be matched by the mesh. The default value is FREE. If unspecified, the existing constraint will remain unchanged. Possible values are:

- FREE: The resulting mesh can be finer or coarser than the specified seeds.
- FINER: The resulting mesh can be finer than the specified seeds.

Return value
`None.`

Exceptions
None.

`setBoundaryLayerControls(...)`

This method sets the control parameters for boundary layer mesh for the specified regions.

Required arguments

regions A sequence of *Cell* objects specifying the regions for which to set the boundary layer mesh control parameters.

firstElemSize A Float specifying the height of the first element layer off boundary. Possible values are $0.0 < firstElemSize \leq 10^6$.

growthFactor A Float specifying the ratio of heights of any two consecutive element layers. Possible values are $1.0 \leq growthFactor \leq 10.0$.

numLayers An Int specifying the number of element layers to be generated. Possible values are $1 \leq numLayers \leq 10^4$.

Optional arguments

inactiveFaces A sequence of *Face* objects specifying the faces where boundary layer should not be generated. By default, boundary layer mesh will be generated on all faces of the selected regions.

setName A String specifying a unique name for a set that will contain boundary layer elements.

Return value

`None.`

Exceptions

None.

`setElementType(...)`

This method assigns element types to the specified regions.

Required arguments

regions A sequence of Geometry regions or *MeshElement* objects, or a Set object containing either geometry regions or elements, specifying the regions to which element types are to be assigned.

elemTypes A sequence of ElemType objects, one for each element shape applicable to the regions.

Note:

If an ElemType object has an UNKNOWN_*xxx* value for *elemCode*, its order will be deduced from the order of other valid ElemType objects within the same `setElementType` command. If no valid ElemType objects can be found, the order will remain unchanged.

Optional arguments

None.

Return value

`None.`

Exceptions

As a result of the element assignment, a region must have the same library, family, and order for all its assigned element types. Otherwise, an exception will be thrown.

For example, suppose the Hex, Wedge, and Tet elements previously assigned to a cell are all linear. The user now constructs an ElemType object with a quadratic Hex element and includes only this object in the `setElementType` command. An exception will be thrown because the Wedge and Tet elements will remain linear (i.e., As Is) and become incompatible with the newly assigned quadratic Hex element.

`setLogicalCorners(...)`

This method sets the logical corners for a mappable face region.

Required arguments

region A Face region.

corners Three, four, or five Vertex objects defining the logical corners for a given mappable face region.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`setMeshControls(...)`

This method sets the mesh control parameters for the specified regions.

Required arguments

regions A sequence of Face or Cell regions specifying the regions for which to set the mesh control parameters.

Optional arguments

elemShape A SymbolicConstant specifying the element shape to be used for meshing. The default value is QUAD for Face regions and HEX for Cell regions. If unspecified, the existing element shape will remain unchanged. Possible values are:

- QUAD: Quadrilateral mesh.
- QUAD_DOMINATED: Quadrilateral-dominated mesh.
- TRI: Triangular mesh.
- HEX: Hexahedral mesh.
- HEX_DOMINATED: Hex-dominated mesh.
- TET: Tetrahedral mesh.
- WEDGE: Wedge mesh.

technique
A SymbolicConstant specifying the mesh technique to be used. The default value is FREE for Face regions. For Cell regions the initial value depends on the geometry of the regions and can be STRUCTURED, SWEEP, or "unmeshable." If unspecified, the existing mesh technique(s) will remain unchanged. Possible values are:

- FREE: Free mesh technique.
- STRUCTURED: Structured mesh technique.
- SWEEP: Sweep mesh technique.
- BOTTOM_UP: Bottom-up mesh technique. Only applicable for cell regions.
- SYSTEM_ASSIGN: Allow the system to assign a suitable technique. The actual technique assigned can be STRUCTURED, SWEEP, or "unmeshable."

algorithm
A SymbolicConstant specifying the algorithm used to generate the mesh for the specified regions. Possible values are MEDIAL_AXIS, ADVANCING_FRONT, and NON_DEFAULT. If unspecified, the existing value will remain unchanged. This option is applicable only to the following:

- Free quadrilateral or quadrilateral-dominated meshing. In this case the possible values are MEDIAL_AXIS and ADVANCING_FRONT.
- Sweep hexahedral or hexahedral-dominated meshing. In this case the possible values are MEDIAL_AXIS and ADVANCING_FRONT.
- Free tetrahedral meshing. In this case the only possible value is NON_DEFAULT, and it indicates that the free tetrahedral-meshing technique available in Abaqus 6.4 or earlier will be used. If algorithm is not specified, the default tetrahedral-meshing technique will be used.

minTransition
A Boolean specifying whether minimum transition is to be applied. The default value is ON. If unspecified, the existing value will remain unchanged. This option is applicable only in the following cases:

- Free quadrilateral meshing or hexahedral sweep meshing with *algorithm*=MEDIAL_AXIS.
- Structured quadrilateral meshing.

sizeGrowth
A SymbolicConstant specifying element size growth to be applied when generating the interior of a tetrahedral mesh. Possible values are MODERATE and MAXIMUM. If unspecified, the existing value will remain unchanged. This option only applies to the default tetrahedral mesher.

allowMapped
A Boolean specifying whether mapped meshing can be used to replace the selected mesh technique. The *allowMapped* argument is applicable only in the following cases:

- Free triangular meshing.
- Free quadrilateral or quadrilateral-dominated meshing with *algorithm*=ADVANCING_FRONT.
- Hexahedral or hexahedral-dominated sweep meshing with *algorithm*=ADVANCING_FRONT.
- Free tetrahedral meshing. *allowMapped*=True implies that mapped triangular meshing can be used on faces that bound three-dimensional *regions*.

Return value
`None.`

Exceptions

None.

setSweepPath(...)

This method sets the sweep path for a sweepable region or the revolve path for a revolvable region.

Required arguments

region A sweepable region.

edge An *Edge* object specifying the sweep or revolve path.

sense A SymbolicConstant specifying the sweep sense. The sense will affect only how gasket elements will be created; it will have no effect if gasket elements are not used. Possible values are FORWARD or REVERSE.

If *sense*=FORWARD, the sense of the given edge's underlying curve will be used.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

verifyMeshQuality(...)

This method tests the mesh quality of a part and returns poor-quality elements.

Required arguments

criterion A SymbolicConstant specifying the criterion used for the quality check. Possible values are:

ANALYSIS_CHECKS

When this criterion is specified Abaqus/CAE will invoke the element quality checks included with the input file processor for Abaqus/Standard and Abaqus/Explicit.

ANGULAR_DEVIATION

The maximum amount (in degrees) that an element's face corner angles deviate from the ideal angle. The ideal angle is 90° for quadrilateral element faces and 60° for triangular element faces. Elements with an angular deviation larger than the specified threshold will fail this test.

ASPECT_RATIO

The ratio between the lengths of the longest and shortest edges of an element. Elements with an aspect ratio larger than the specified threshold will fail this test.

GEOM_DEVIATION_FACTOR

The largest geometric deviation factor evaluated along any of the element edges associated with geometric edges or faces. The geometric deviation factor along an element edge is calculated by dividing the maximum gap between the element edge and its associated geometry by the length of the element edge. Elements with a geometric deviation factor larger than the specified threshold will fail this test.

LARGE_ANGLE

The largest corner angle on any of an element's faces. Elements with face angles larger than the specified threshold (in degrees) will fail this test.

LONGEST_EDGE

The length of an element's longest edge. Elements with an edge longer than the specified threshold will fail this test.

MAX_FREQUENCY

An estimate of an element's contribution to the initial maximum allowable frequency for Abaqus/Standard analyses. This calculation requires appropriate section assignments and material definitions. Elements whose maximum allowable frequency is smaller than the given value will fail this test.

SHAPE_FACTOR

The shape factor for triangular and tetrahedral elements. This is the ratio between the element area or volume and the optimal element area or volume. Elements with a shape factor smaller than the specified threshold will fail this test.

SHORTEST_EDGE

The length of an element's shortest edge. Elements with an edge shorter than the specified threshold will fail this test.

SMALL_ANGLE

The smallest corner angle on any of an element's faces. Elements with face angles smaller than the given value (in degrees) will fail this test.

STABLE_TIME_INCREMENT

An estimate of an element's contribution to the initial maximum stable time increment for Abaqus/Explicit analyses. This calculation requires appropriate section assignments and material definitions. Elements that require a time increment smaller than the given value will fail this test.

Optional arguments

threshold
A Float value used to determine low quality elements according to the specified criterion. This argument is ignored when the ANALYSIS_CHECKS criterion is used. For other criterion, if this argument is unspecified then no list of failed elements will be returned.

elemShape
A SymbolicConstant specifying an element shape for limiting the query. Possible values are LINE, QUAD, TRI, HEX, WEDGE, and TET.

regions
A sequence of *Region* or *MeshElement* objects. If you do not specify the *regions* argument, the entire part mesh is considered.

Return value

A Dictionary object containing values for some number of the following keys: failedElements, warningElements, naElements (sequences of *MeshElement* objects); numElements (Int); average, worst (Float); worstElement (*MeshElement* object)

Exceptions

None.

ElemType object

The ElemType object is an argument object used as an argument in the `setElementType` command.

Access

```
import mesh
```

ElemType(...)

This method creates an ElemType object.

Path

```
ElemType
```

Required arguments

elemCode A SymbolicConstant specifying the Abaqus element code or just the element shape. Possible values are:

- C3D8R, specifying an 8-node linear brick, reduced integration with hourglass control.
- CODE, specifying add more codes.
- UNKNOWN_TRI, specifying an unknown element type associated with a triangular shape.
- UNKNOWN_QUAD, specifying an unknown element type associated with a quadrilateral shape.
- UNKNOWN_HEX, specifying an unknown element type associated with a hexahedral shape.
- UNKNOWN_WEDGE, specifying an unknown element type associated with a wedge shape.
- UNKNOWN_TET, specifying an unknown element type associated with a tetrahedral shape.

Optional arguments

elemLibrary A SymbolicConstant specifying the Abaqus element library to use. Possible values are STANDARD and EXPLICIT. The default value is STANDARD.

hourglassStiffness A Float specifying the hourglass stiffness. (For shell elements this is the membrane hourglass stiffness.) A value of zero indicates the default value should be used. The default value will be used where appropriate. The default value is 0.0.

This argument is applicable only to some Abaqus/Standard elements.

bendingHourglass A Float specifying the bending hourglass stiffness. A value of zero indicates the default value should be used. The default value will be used where appropriate. The default value is 0.0.

This argument is applicable only to some Abaqus/Standard elements.

drillingHourglass A Float specifying the drilling hourglass scaling factor. A value of zero indicates the default value should be used. The default value will be used where appropriate. The default value is 0.0.

This argument is applicable only to some Abaqus/Standard elements.

kinematicSplit

A SymbolicConstant specifying the kinematic split control. Possible values are AVERAGE_STRAIN, ORTHOGONAL, and CENTROID. The default value is AVERAGE_STRAIN.

This argument is applicable only to some Abaqus/Explicit elements.

distortionControl

A Boolean specifying whether to prevent negative element volumes or other excessive distortions in crushable materials. The default value is OFF.

This argument is applicable only to some Abaqus/Explicit elements.

lengthRatio

A Float specifying the length ratio for distortion control in crushable materials. Possible values are $0.0 \le$ *lengthRatio* ≤ 1.0. The default value is *lengthRatio*=**0.1**

This argument is applicable only when *distortionControl* is ON.

secondOrderAccuracy

A Boolean specifying the second-order accuracy option. The default value is OFF.

This argument is applicable only to some Abaqus/Explicit elements.

hourglassControl

A SymbolicConstant specifying the hourglass control. Possible values are RELAX_STIFFNESS, STIFFNESS, VISCOUS, ENHANCED, and COMBINED. The default value is ENHANCED.

This argument is applicable only to some Abaqus/Explicit elements.

weightFactor

A Float specifying a weight factor when *hourglassControl*=COMBINED. The default value is 0.5.

This argument is applicable only to some Abaqus/Explicit elements.

displacementHourglass

A Float specifying the displacement hourglass scaling factor. The default value will be used where appropriate. The default value is 1.0.

This argument is applicable only to some Abaqus/Explicit elements.

rotationalHourglass

A Float specifying the rotational hourglass scaling factor. The default value will be used where appropriate. The default value is 1.0.

This argument is applicable only to some Abaqus/Explicit elements.

outOfPlaneDisplacementHourglass

A Float specifying the out-of-plane displacement hourglass scaling factor. The default value will be used where appropriate. The default value is 1.0.

This argument is applicable only to some Abaqus/Explicit elements.

elemDeletion

A SymbolicConstant specifying the element deletion option. Possible values are DEFAULT, ON, and OFF. The default value is DEFAULT.

particleConversion

A SymbolicConstant specifying the particle conversion option for smoothed particle hydrodynamics. When not OFF or DEFAULT this argument either indicates uniform background grid conversion, or it indicates the criterion used

for per-element conversion of elements to particles. Possible values are DEFAULT, OFF, GRID, TIME, STRAIN, and STRESS. The default value is DEFAULT.

This argument is applicable only to some Abaqus/Explicit elements.

particleConversionThreshold

A Float specifying the threshold value for the per-element particle conversion criterion specified by *particleConversion*. The default value is 0.0.

This argument is applicable only to some Abaqus/Explicit elements.

particleConversionPPD

An Int specifying the number of particles per direction for element conversion when *particleConversion* specifies a per-element conversion criterion. The default value is 1.

This argument is applicable only to some Abaqus/Explicit elements.

particleConversionKernel

A SymbolicConstant specifying the interpolation function for particle conversion when *particleConversion* is specified. Possible values are CUBIC, QUADRATIC, and QUINTIC. The default value is CUBIC.

This argument is applicable only to some Abaqus/Explicit elements.

particleGridSpacing

A Float specifying the spacing of the background grid, when *particleConversion* is specified as GRID. By default, no spacing value will be specified.

This argument is applicable only to some Abaqus/Explicit elements.

particleGridTIC

A Boolean indicating whether to apply tensile instability control when *particleConversion* is specified as GRID. Possible values are True, False, or None, which means to use the default setting. The default value is None.

This argument is applicable only to some Abaqus/Explicit elements.

particleThickness

A SymbolicConstant specifying the thickness of the particles when *particleConversion* is specified as GRID. Possible values are DEFAULT, VARIABLE, and UNIFORM. The default value is DEFAULT.

This argument is applicable only to some Abaqus/Explicit elements.

maxDegradation

A Float specifying the maximum degradation option for damage control. The default value is −1.0.

viscosity

A Float specifying the viscosity option. The default value is 0.0.

This argument is applicable only to some Abaqus/Standard elements.

linearBulkViscosity

A Float specifying the linear bulk viscosity scaling factor option for Abaqus/Explicit. The default value is 1.0.

quadraticBulkViscosity

A Float specifying the quadratic bulk viscosity scaling factor option for Abaqus/Explicit. The default value is 1.0.

numFourierModes

An Int specifying the number of Fourier modes. Possible values are 1, 2, 3, and 4. The default value is 1.

This argument is applicable only for axisymmetric elements with nonlinear asymmetric deformation.

nodeOffset

An Int specifying the positive offset number for specifying the additional nodes needed in the connectivity.

This argument is applicable only for axisymmetric elements with nonlinear asymmetric deformation.

linearKinematicCtrl

A Float specifying the linear kinematic conversion value.

This argument is applicable only to some Abaqus/Explicit elements.

initialGapOpening

A Float specifying the initial gap opening.

This parameter is applicable only to some Abaqus/Standard elements.

Return value

An ElemType object.

Exceptions

None.

Members

The ElemType object has members with the same names and descriptions as the arguments to the *ElemType* method.

MeshEdge object

The MeshEdge object refers to an element edge. It has no constructor or members. A MeshEdge object can be accessed via a *MeshEdgeArray* or a repository on a part or part instance.

Access

```
import part
mdb.models[name].parts[name].elemEdges[i]
mdb.models[name].parts[name].elementEdges[i]
import assembly
mdb.models[name].rootAssembly.allInstances[name].elemEdges[i]
mdb.models[name].rootAssembly.allInstances[name].elementEdges[i]
mdb.models[name].rootAssembly.instances[name].elemEdges[i]
mdb.models[name].rootAssembly.instances[name].elementEdges[i]
```

`getElements()`

This method returns a tuple of elements that share the element edge.

Arguments

None.

Return value

A tuple of *MeshElement* objects.

Exceptions

None.

`getElementsViaTopology()`

This method returns an array of *MeshElement* objects that are obtained by recursively finding adjacent elements via topology.

Optional arguments

domain A MeshElementArray object specifying the domain to include in the search. By default, all elements in the mesh are included.

Return value

A *MeshElementArray* object, which is a sequence of *MeshElement* objects.

Exceptions

None.

getNodesViaTopology()

This method returns an array of *MeshNode* objects that lie along element edges topologically in line with the element edge.

Optional arguments

domain A MeshElementArray object specifying the domain to include in the search. By default, all elements in the mesh are included.

Return value

A *MeshNodeArray* object, which is a sequence of *MeshNode* objects.

Exceptions

None.

getElemFaces()

This method returns a tuple of unique *MeshFace* objects that share the element edge.

Arguments

None.

Return value

A tuple of *MeshFace* objects.

Exceptions

None.

getNodes()

This method returns a tuple of nodes on the element edge.

Arguments

None.

Return value

A tuple of *MeshNode* objects.

Exceptions

None.

Members

The MeshEdge object has no members.

MeshEdgeArray object

The MeshEdgeArray is a sequence of *MeshEdge* objects.

Access

```
import part
mdb.models[name].parts[name].elementEdges
import assembly
mdb.models[name].rootAssembly.allInstances[name].elementEdges
mdb.models[name].rootAssembly.instances[name].elementEdges
```

MeshEdgeArray(...)

This method creates a MeshEdgeArray object.

Path

mesh.MeshEdgeArray

Required arguments

elemEdges A list of *MeshEdge* objects.

Optional arguments

None.

Return value

A MeshEdgeArray object.

Exceptions

None.

getSequenceFromMask(...)

This method returns the objects in the MeshEdgeArray identified using the specified *mask*. When large number of objects are involved, this method is highly efficient.

Required arguments

mask A String specifying the object or objects.

Optional arguments

None.

Return value

A MeshEdgeArray object.

Exceptions

An exception occurs if the resulting sequence is empty.	Error: The mask results in an empty sequence

`getMask()`

This method returns a string specifying the object or objects.

Arguments

None.

Return value

A String specifying the object or objects.

Exceptions

None.

Members

The MeshEdgeArray object has no members.

MeshElement object

The MeshElement object refers to an element of a native mesh or an orphan mesh. A MeshElement object can be accessed via a part or part instance using an index that refers to the internal numbering of the element repository. The index does not refer to the element label.

Access

```
import part
mdb.models[name].parts[name].allInternalSets[name].elements[i]
mdb.models[name].parts[name].allInternalSurfaces[name].elements[i]
mdb.models[name].parts[name].allSets[name].elements[i]
mdb.models[name].parts[name].allSurfaces[name].elements[i]
mdb.models[name].parts[name].elements[i]
mdb.models[name].parts[name].sets[name].elements[i]
mdb.models[name].parts[name].surfaces[name].elements[i]
import assembly
mdb.models[name].rootAssembly.allInstances[name].elements[i]
mdb.models[name].rootAssembly.allInstances[name].sets[name].elements[i]
mdb.models[name].rootAssembly.allInstances[name].surfaces[name].elements[i]
mdb.models[name].rootAssembly.allInternalSets[name].elements[i]
mdb.models[name].rootAssembly.allInternalSurfaces[name].elements[i]
mdb.models[name].rootAssembly.allSets[name].elements[i]
mdb.models[name].rootAssembly.allSurfaces[name].elements[i]
mdb.models[name].rootAssembly.elements[i]
mdb.models[name].rootAssembly.instances[name].elements[i]
mdb.models[name].rootAssembly.instances[name].sets[name].elements[i]
mdb.models[name].rootAssembly.instances[name].surfaces[name]\
.elements[i]
mdb.models[name].rootAssembly.modelInstances[i].elements[i]
mdb.models[name].rootAssembly.modelInstances[i].sets[name].elements[i]
mdb.models[name].rootAssembly.modelInstances[i].surfaces[name]\
.elements[i]
mdb.models[name].rootAssembly.sets[name].elements[i]
mdb.models[name].rootAssembly.surfaces[name].elements[i]
```

Element(...)

This method creates an element on an orphan mesh part from a sequence of nodes.

Path

mdb.models[*name*].parts[*name*].Element

Required arguments

nodes

A sequence of *MeshNode* objects.

elemShape

A SymbolicConstant specifying the shape of the new element. Possible values are LINE2, LINE3, TRI3, TRI6, QUAD4, QUAD8, TET4, TET10, WEDGE6, WEDGE15, HEX8, and HEX20.

Optional arguments

label An Int specifying the element label.

Return value

A MeshElement object.

Exceptions

None.

`getNodes()`

This method returns a tuple of node objects of the element.

Arguments

None.

Return value

A tuple of *MeshNode* objects.

Exceptions

None.

`getElemEdges()`

This method returns a tuple of unique element edge objects on the element.

Arguments

None.

Return value

A tuple of *MeshEdge* objects.

Exceptions

None.

`getElemFaces()`

This method returns a tuple of unique element face objects on the element.

Arguments

None.

Return value

A tuple of *MeshFace* objects.

Exceptions

None.

getAdjacentElements()

This method returns an array of element objects adjacent to the mesh element.

Arguments

None.

Return value

A *MeshElementArray* object which is a sequence of MeshElement objects.

Exceptions

None.

getElementsByFeatureEdge(...)

This method returns an array of mesh element objects that are obtained by recursively finding adjacent elements along a feature edge with a face angle of less than or equal to the specified angle.

Required arguments

angle A float specifying the value of the face angle in degrees.

Optional arguments

None.

Return value

A *MeshElementArray* object, which is a sequence of MeshElement objects.

Exceptions

None.

setValues(...)

This method modifies the MeshElement object.

Required arguments

None.

Optional arguments

label
An Int specifying the element label. This member may only be edited if the element belongs to an orphan mesh part. The specified label must be non-negative and must not be in use by any other element of the same part.

Return value

`None.`

Exceptions

None.

Members

The MeshElement object has the following members:

label
An Int specifying the element label.

type
A SymbolicConstant specifying the Abaqus element code.

instanceName
A String specifying the name of the part instance that owns this element.

connectivity
A tuple of Ints specifying the internal node indices that define the nodal connectivity. It is important to note the difference with OdbMeshElement object of ODB where the connectivity is node labels instead of node indices.

MeshElementArray object

The MeshElementArray is a sequence of *MeshElement* objects.

Access

```
import part
mdb.models[name].parts[name].allInternalSets[name].elements
mdb.models[name].parts[name].allInternalSurfaces[name].elements
mdb.models[name].parts[name].allSets[name].elements
mdb.models[name].parts[name].allSurfaces[name].elements
mdb.models[name].parts[name].elements
mdb.models[name].parts[name].sets[name].elements
mdb.models[name].parts[name].surfaces[name].elements
import assembly
mdb.models[name].rootAssembly.allInstances[name].elements
mdb.models[name].rootAssembly.allInstances[name].sets[name].elements
mdb.models[name].rootAssembly.allInstances[name].surfaces[name].elements
mdb.models[name].rootAssembly.allInternalSets[name].elements
mdb.models[name].rootAssembly.allInternalSurfaces[name].elements
mdb.models[name].rootAssembly.allSets[name].elements
mdb.models[name].rootAssembly.allSurfaces[name].elements
mdb.models[name].rootAssembly.elements
mdb.models[name].rootAssembly.instances[name].elements
mdb.models[name].rootAssembly.instances[name].sets[name].elements
mdb.models[name].rootAssembly.instances[name].surfaces[name].elements
mdb.models[name].rootAssembly.modelInstances[i].elements
mdb.models[name].rootAssembly.modelInstances[i].sets[name].elements
mdb.models[name].rootAssembly.modelInstances[i].surfaces[name]\
.elements
mdb.models[name].rootAssembly.sets[name].elements
mdb.models[name].rootAssembly.surfaces[name].elements
```

MeshElementArray(...)

This method creates a MeshElementArray object.

Path

mesh.MeshElementArray

Required arguments

elements A list of *MeshElement* objects.

Optional arguments

None.

Return value

A MeshElementArray object.

Exceptions

None.

`getFromLabel(...)`

This method returns the object in the MeshElementArray with the given label.

Required arguments

label An Int specifying the label of the object.

Optional arguments

None.

Return value

A *MeshElement* object.

Exceptions

None.

`getSequenceFromMask(...)`

This method returns the objects in the MeshElementArray identified using the specified *mask*. This command is generated when the *JournalOptions* are set to COMPRESSEDINDEX. When a large number of objects are involved, this method is highly efficient.

Required arguments

mask A String specifying the object or objects.

Optional arguments

None.

Return value

A MeshElementArray object.

Exceptions

None.

`getMask()`

This method returns a string specifying the object or objects.

Arguments

None.

Return value

A String specifying the object or objects.

Exceptions

None.

getExteriorEdges()

This method returns the exterior element edges for 2D/shell elements in the MeshElementArray. These are edges referenced by exactly one element in the sequence. Nothing is returned if the sequence contains no topologically 2D/shell elements.

Arguments

None.

Return value

A MeshEdgeArray object specifying the element edges on the exterior.

Exceptions

None.

getExteriorFaces()

This method returns the exterior element faces for solid elements in the MeshElementArray. These are faces referenced by exactly one element in the sequence. Nothing is returned if the sequence contains no topologically solid elements.

Arguments

None.

Return value

A MeshFaceArray object specifying the element faces on the exterior.

Exceptions

None.

getByBoundingBox(...)

This method returns an array of element objects that lie within the specified bounding box.

Required arguments

None.

Optional arguments

xMin

A float specifying the minimum X boundary of the bounding box.

yMin A float specifying the minimum Y boundary of the bounding box.

zMin A float specifying the minimum Z boundary of the bounding box.

xMax A float specifying the maximum X boundary of the bounding box.

yMax A float specifying the maximum Y boundary of the bounding box.

zMax A float specifying the maximum Z boundary of the bounding box.

Return value

A MeshElementArray object, which is a sequence of *MeshElement* objects.

Exceptions

None.

`getByBoundingCylinder(...)`

This method returns an array of element objects that lie within the specified bounding cylinder.

Required arguments

center1 A tuple of the X-, Y-, and Z-coordinates of the center of the first end of the cylinder.

center2 A tuple of the X-, Y-, and Z-coordinates of the center of the second end of the cylinder.

radius A float specifying the radius of the cylinder.

Optional arguments

None.

Return value

A MeshElementArray object, which is a sequence of *MeshElement* objects.

Exceptions

None.

`getByBoundingSphere(...)`

This method returns an array of element objects that lie within the specified bounding sphere.

Required arguments

center A tuple of the X-, Y-, and Z-coordinates of the center of the sphere.

radius A float specifying the radius of the sphere.

Optional arguments

None.

Return value

A MeshElementArray object, which is a sequence of *MeshElement* objects.

Exceptions

None.

`getBoundingBox()`

This method returns a dictionary of two tuples representing minimum and maximum boundary values of the bounding box of the minimum size containing the element sequence.

Arguments

None.

Return value

A Dictionary object with the following items:

low: a tuple of three floats representing the minimum x, y, and z boundary values of the bounding box.

high: a tuple of three floats representing the maximum x, y, and z boundary values of the bounding box.

Exceptions

None.

`getMemberFromAll(...)`

This method returns a tuple containing a member or members for each MeshElement in the MeshElementArray.

Required arguments

member A String specifying a MeshElement member name, or a tuple of member names.

Optional arguments

None.

Return value

A tuple of member values, one for each MeshElement, or a tuple of tuples of member values, if you specified a tuple of member names in the *member* argument.

Exceptions

An exception occurs if no such member exists.	AttributeError: 'MeshElement' object has no attribute ''

`sequenceFromLabels(...)`

This method returns the objects in the MeshElementArray identified using the specified labels.

Required arguments

labels	A sequence of Ints specifying the labels.

Optional arguments

None.

Return value

A MeshElementArray object.

Exceptions

An exception occurs if the resulting sequence is empty.	Error: The mask results in an empty sequence

Members

The MeshElementArray object has no members.

MesherOptions object

The MesherOptions object controls the default settings that Abaqus uses for all meshing methods. The MesherOptions object has no constructor. Abaqus creates the *MesherOptions* member when a session is started.

MesherOptions commands are intended for use at the beginning of scripts and in the `abaqus_v6.env` file only; they should not be used during an Abaqus/CAE session.

Access

```
session.defaultMesherOptions
```

`setValues(...)`

This method modifies the MesherOptions object.

Required arguments

None.

Optional arguments

elemShape2D
A SymbolicConstant specifying the default element shape for meshing two-dimensional objects. Possible values are QUAD, QUAD_DOMINATED, and TRI. The default value is QUAD_DOMINATED.

elemShape3D
A SymbolicConstant specifying the default element shape for meshing three-dimensional objects. Possible values are HEX, HEX_DOMINATED, WEDGE, and TET. The default value is HEX.

quadAlgorithm
A SymbolicConstant specifying the default algorithm for meshing an object with quad- or quad-dominated elements. Possible values are ADVANCING_FRONT and MEDIAL_AXIS. The default value is ADVANCING_FRONT.

allowMapped
A Boolean specifying whether Abaqus/CAE should allow mapped meshing, where appropriate. The default value is OFF.

minTransition
A Boolean specifying whether Abaqus/CAE should attempt to minimize the mesh transition when it moves from a coarse mesh to a fine mesh. The default value is ON.

guiPreferredElements
A list of SymbolicConstants specifying preferred Abaqus element types. This setting is relevant only when Abaqus/CAE is run interactively. When a part or part instance that has never been assigned an element type is meshed, this list is consulted. If an element type appropriate to the geometry is found in the list, it is assigned to the geometry. Multiple element types representing different shapes (for example, triangles and quadrilaterals) can be assigned in combination, but only element types that are compatible with each other are used. When more than one appropriate element type is found in the list, the first element type encountered takes precedence. This list is also consulted when populating the element type dialog; preferred types are selected by default for a region not previously assigned any element types. The default value is an empty list.

Return value

```
None.
```

Exceptions

None.

Members

The MesherOptions object has members with the same names and descriptions as the arguments to the *setValues* method.

MeshFace object

The MeshFace object refers to an element face. It has no constructor or members. A MeshFace object can be accessed via a *MeshFaceArray* or a repository on a part or part instance.

Access

```
import part
mdb.models[name].parts[name].elementFaces[i]
mdb.models[name].parts[name].elemFaces[i]
import assembly
mdb.models[name].rootAssembly.allInstances[name].elementFaces[i]
mdb.models[name].rootAssembly.allInstances[name].elemFaces[i]
mdb.models[name].rootAssembly.instances[name].elementFaces[i]
mdb.models[name].rootAssembly.instances[name].elemFaces[i]
```

`getElemEdges()`

This method returns a tuple of unique element edges on the element face.

Arguments

None.

Return value

A tuple of *MeshEdge* objects.

Exceptions

None.

`getElements()`

This method returns a tuple of elements that share the element face.

Arguments

None.

Return value

A tuple of *MeshElement* objects.

Exceptions

None.

`getNodes()`

This method returns a tuple of nodes on the element face.

Arguments

None.

Return value

A tuple of *MeshNode* objects.

Exceptions

None.

getNodesByFaceAngle(...)

This method returns an array of mesh node objects that are obtained by recursively finding adjacent element faces that are at an angle of less than or equal to the specified angle.

Required arguments

angle A float specifying the value of the face angle.

Optional arguments

None.

Return value

A *MeshNodeArray* object, which is a sequence of *MeshNode* objects.

Exceptions

None.

getNormal(...)

This method returns the normal direction for the element face.

Required arguments

None.

Optional arguments

None.

Return value

A tuple of 3 floats representing the unit normal vector. If the element face is collapsed such that a normal cannot be computed, a zero-length vector is returned.

Exceptions

None.

getElemFacesByFaceAngle(...)

This method returns an array of element face objects that are obtained by recursively finding adjacent element faces that are at an angle of less than or equal to the specified angle.

Required arguments

angle A float specifying the value of the face angle.

Optional arguments

None.

Return value

A *MeshFaceArray* object, which is a sequence of MeshFace objects.

Exceptions

None.

getElemEdgesByFaceAngle(...)

This method returns an array of element edge objects that are obtained by recursively finding adjacent element edges that are at an angle of less than or equal to the specified face angle.

Required arguments

angle A float specifying the value of the face angle in degrees.

Optional arguments

None.

Return value

A *MeshEdgeArray* object, which is a sequence of *MeshEdge* objects.

Exceptions

None.

getElementsByFaceAngle(...)

This method returns an array of mesh Element objects that are obtained by recursively finding adjacent element faces that are at an angle of less than or equal to the specified angle.

Required arguments

angle A float specifying the value of the face angle.

Optional arguments

None.

Return value

A *MeshElementArray* object, which is a sequence of *MeshElement* objects.

Exceptions

None.

getElemFacesByLimitingAngle(...)

This method returns an array of element edge objects that are obtained by recursively finding adjacent element faces that are at an angle of less than or equal to the specified face angle with the seed face.

Required arguments

angle A float specifying the value of the face angle in degrees.

Optional arguments

None.

Return value

A *MeshFaceArray* object, which is a sequence of MeshFace objects.

Exceptions

None.

getElementsViaTopology()

This method returns an array of mesh Element objects that are obtained by recursively finding adjacent elements via topology.

Arguments

None.

Return value

A *MeshElementArray* object, which is a sequence of *MeshElement* objects.

Exceptions

None.

getElemFacesByLayer()

This method returns an array of element face objects, obtained by traversing shell elements or the exterior of a solid mesh, and recursively finding adjacent element faces by layer.

Required arguments

numLayers A int specifying the value of the number of layers.

Optional arguments

None.

Return value

A *MeshFaceArray* object, which is a sequence of MeshFace objects.

Exceptions

None.

Members

The MeshFace object has the following members:

label An Int specifying the element label.

face A symbolic constant specifying the side of the element.

MeshFaceArray object

The MeshFaceArray is a sequence of *MeshFace* objects.

Access

```
import part
mdb.models[name].parts[name].elementFaces
import assembly
mdb.models[name].rootAssembly.allInstances[name].elementFaces
mdb.models[name].rootAssembly.instances[name].elementFaces
```

MeshFaceArray(...)

This method creates a MeshFaceArray object.

Path

mesh.MeshFaceArray

Required arguments

elemFaces A list of *MeshFace* objects.

Optional arguments

None.

Return value

A MeshFaceArray object.

Exceptions

None.

getSequenceFromMask(...)

This method returns the objects in the MeshFaceArray identified using the specified *mask*. When large number of objects are involved, this method is highly efficient.

Required arguments

mask A String specifying the object or objects.

Optional arguments

None.

Return value

A MeshFaceArray object.

Exceptions

An exception occurs if the resulting sequence is empty. Error: The mask results in an empty sequence.

getMask()

This method returns a string specifying the object or objects.

Arguments

None.

Return value

A String specifying the object or objects.

Exceptions

None.

getMemberFromAll(...)

This method returns a tuple containing a member or members for each MeshFace in the MeshFaceArray.

Required arguments

member A String specifying a MeshFace member name or a tuple of member names.

Optional arguments

None.

Return value

A tuple of member values (one for each MeshFace) or a tuple of tuples of member values (if you specified a tuple of member names in the *member* argument).

Exceptions

An exception occurs if no such member exists. AttributeError: 'MeshFace' object has no attribute ''

Members

The MeshFaceArray object has no members.

MeshNode object

The MeshNode object refers to a node of a native mesh or an orphan mesh. A MeshNode object can be accessed via a part or part instance using an index that refers to the internal numbering of the node repository. The index does not refer to the node label.

Access

```
import part
mdb.models[name].parts[name].allInternalSets[name].nodes[i]
mdb.models[name].parts[name].allInternalSurfaces[name].nodes[i]
mdb.models[name].parts[name].allSets[name].nodes[i]
mdb.models[name].parts[name].allSurfaces[name].nodes[i]
mdb.models[name].parts[name].nodes[i]
mdb.models[name].parts[name].retainedNodes[i]
mdb.models[name].parts[name].sets[name].nodes[i]
mdb.models[name].parts[name].surfaces[name].nodes[i]
import assembly
mdb.models[name].rootAssembly.allInstances[name].nodes[i]
mdb.models[name].rootAssembly.allInstances[name].sets[name].nodes[i]
mdb.models[name].rootAssembly.allInstances[name].surfaces[name].nodes[i]
mdb.models[name].rootAssembly.allInternalSets[name].nodes[i]
mdb.models[name].rootAssembly.allInternalSurfaces[name].nodes[i]
mdb.models[name].rootAssembly.allSets[name].nodes[i]
mdb.models[name].rootAssembly.allSurfaces[name].nodes[i]

```

Node(...)

This method creates a node on an orphan mesh part.

Path

mdb.models[*name*].parts[*name*].Node

Required arguments

coordinates
A sequence of three Floats specifying the coordinates of the new node.

Optional arguments

localCsys
A DatumCsys object specifying the local coordinate system. If unspecified, the global coordinate system will be used.

label An Int specifying the node label.

Return value

A MeshNode object.

Exceptions

None.

`getElemEdges()`

This method returns a tuple of element edge objects that share the node.

Arguments

None.

Return value

A tuple of *MeshEdge* objects.

Exceptions

None.

`getElemFaces()`

This method returns a tuple of element face objects that share the node.

Arguments

None.

Return value

A tuple of *MeshFace* objects.

Exceptions

None.

`getElements()`

This method returns a tuple of element objects that share the node.

Arguments

None.

Return value

A tuple of *MeshElement* objects.

Exceptions

None.

getNodesByFeatureEdge(...)

This method returns an array of mesh node objects that are obtained by recursively finding adjacent nodes along a feature edge that are at an angle of less than or equal to the specified face angle.

Required arguments

angle A float specifying the value of the face angle in degrees.

Optional arguments

None.

Return value

A *MeshNodeArray* object, which is a sequence of MeshNode objects.

Exceptions

None.

setValues(...)

This method modifies the MeshNode object.

Required arguments

None.

Optional arguments

label An Int specifying the node label. This member may only be edited if the node belongs to an orphan mesh part. The specified label must be non-negative and must not be in use by any other node of the same part.

Return value

`None.`

Exceptions

None.

Members

The MeshNode object has the following members:

label An Int specifying the node label.

instanceName
A String specifying the name of the part instance that owns this node.

coordinates
A tuple of three Floats specifying the coordinates of the new node.

MeshNodeArray object

The MeshNodeArray is a sequence of *MeshNode* objects.

Access

```
import part
mdb.models[name].parts[name].allInternalSets[name].nodes
mdb.models[name].parts[name].allInternalSurfaces[name].nodes
mdb.models[name].parts[name].allSets[name].nodes
mdb.models[name].parts[name].allSurfaces[name].nodes
mdb.models[name].parts[name].nodes
mdb.models[name].parts[name].retainedNodes
mdb.models[name].parts[name].sets[name].nodes
mdb.models[name].parts[name].surfaces[name].nodes
import assembly
mdb.models[name].rootAssembly.allInstances[name].nodes
mdb.models[name].rootAssembly.allInstances[name].sets[name].nodes
mdb.models[name].rootAssembly.allInstances[name].surfaces[name].nodes
mdb.models[name].rootAssembly.allInternalSets[name].nodes
mdb.models[name].rootAssembly.allInternalSurfaces[name].nodes
mdb.models[name].rootAssembly.allSets[name].nodes
mdb.models[name].rootAssembly.allSurfaces[name].nodes
mdb.models[name].rootAssembly.instances[name].nodes
mdb.models[name].rootAssembly.instances[name].sets[name].nodes
mdb.models[name].rootAssembly.instances[name].surfaces[name].nodes
mdb.models[name].rootAssembly.modelInstances[i].nodes
mdb.models[name].rootAssembly.modelInstances[i].sets[name].nodes
mdb.models[name].rootAssembly.modelInstances[i].surfaces[name].nodes
mdb.models[name].rootAssembly.nodes
mdb.models[name].rootAssembly.sets[name].nodes
mdb.models[name].rootAssembly.surfaces[name].nodes
```

MeshNodeArray(...)

This method creates a MeshNodeArray object.

Path

mesh.MeshNodeArray

Required arguments

nodes A list of *MeshNode* objects.

Optional arguments

None.

Return value

A MeshNodeArray object.

Exceptions

None.

getFromLabel(...)

This method returns the object in the MeshNodeArray with the given label.

Required arguments

label An Int specifying the label of the object.

Optional arguments

None.

Return value

A *MeshNode* object.

Exceptions

None.

getSequenceFromMask(...)

This method returns the objects in the MeshNodeArray identified using the specified *mask*. This command is generated when the *JournalOptions* are set to COMPRESSEDINDEX. When a large number of objects are involved, this method is highly efficient.

Required arguments

mask A String specifying the object or objects.

Optional arguments

None.

Return value

A MeshNodeArray object.

Exceptions

None.

getMask()

This method returns a string specifying the object or objects.

Arguments

None.

Return value

A String specifying the object or objects.

Exceptions

None.

`getByBoundingBox(...)`

This method returns an array of nodes that lie within the specified bounding box.

Required arguments

None.

Optional arguments

xMin	A float specifying the minimum X boundary of the bounding box.
yMin	A float specifying the minimum Y boundary of the bounding box.
zMin	A float specifying the minimum Z boundary of the bounding box.
xMax	A float specifying the maximum X boundary of the bounding box.
yMax	A float specifying the maximum Y boundary of the bounding box.
zMax	A float specifying the maximum Z boundary of the bounding box.

Return value

A MeshNodeArray object, which is a sequence of *MeshNode* objects.

Exceptions

None.

`getByBoundingCylinder(...)`

This method returns an array of node objects that lie within the specified bounding cylinder.

Required arguments

center1	A tuple of the X-, Y-, and Z-coordinates of the center of the first end of the cylinder.
center2	A tuple of the X-, Y-, and Z-coordinates of the center of the second end of the cylinder.
radius	A float specifying the radius of the cylinder.

Optional arguments

None.

Return value

A MeshNodeArray object, which is a sequence of *MeshNode* objects.

Exceptions

None.

`getByBoundingSphere(...)`

This method returns an array of node objects that lie within the specified bounding sphere.

Required arguments

center	A tuple of the X-, Y-, and Z-coordinates of the center of the sphere.
radius	A float specifying the radius of the sphere.

Optional arguments

None.

Return value

A MeshNodeArray object, which is a sequence of *MeshNode* objects.

Exceptions

None.

`getBoundingBox()`

This method returns a dictionary of two tuples representing minimum and maximum boundary values of the bounding box of the minimum size containing the node sequence.

Arguments

None.

Return value

A Dictionary object with the following items:

low: a tuple of three floats representing the minimum x, y, and z boundary values of the bounding box.

high: a tuple of three floats representing the maximum x, y, and z boundary values of the bounding box.

`getClosest()`

This method returns the node or nodes closest to the given point or set of points.

Required arguments

coordinates A point defined by x, y, and z values or a list of such points.

Optional arguments

numToFind The number of nodes to find for each given point. For example, if *numToFind* is 2, then the 2 closest points, if available and within *searchTolerance*, will be returned in order of proximity for each input point. The default is 1.

searchTolerance A float specifying a search radius for each point. By default, no search radius is defined, and all nodes in the sequence will be searched.

Return value

A MeshNode, or a list of MeshNode objects, or a list of lists of MeshNode objects, depending on the number of points given and the number of nodes requested.

`getMemberFromAll(...)`

This method returns a tuple containing a member or members for each MeshNode in the MeshNodeArray.

Required arguments

member A String specifying a MeshNode member name or a tuple of member names.

Optional arguments

None.

Return value

A tuple of member values (one for each MeshNode) or a tuple of tuples of member values (if you specified a tuple of member names in the *member* argument).

Exceptions

An exception occurs if no such member exists. AttributeError: 'MeshNode' object has no attribute "

`sequenceFromLabels(...)`

This method returns the objects in the MeshNodeArray identified using the specified labels.

Required arguments

labels A sequence of Ints specifying the labels.

Optional arguments

None.

Return value

A MeshNodeArray object.

Exceptions

An exception occurs if the resulting sequence is empty.	Error: The mask results in an empty sequence.

Members

The MeshNodeArray object has no members.

MeshStats object

The MeshStats object is a query object for holding mesh statistics and is returned by the `getMeshStats` command. The object does not have any methods.

Access

```
import mesh
```

Members

The MeshStats object has the following members:

numPointElems
An Int specifying the number of point elements.

numLineElems
An Int specifying the number of line elements.

numQuadElems
An Int specifying the number of quadrilateral elements.

numTriElems
An Int specifying the number of triangular elements.

numHexElems
An Int specifying the number of hexahedral elements.

numWedgeElems
An Int specifying the number of wedge elements.

numTetElems
An Int specifying the number of tetrahedral elements.

numPyramidElems
An Int specifying the number of pyramid elements.

numNodes
An Int specifying the number of nodes.

numMeshedRegions
An Int specifying the number of regions that contain a mesh.

Messaging commands

Messaging commands are available only if Abaqus/CAE is run interactively using the GUI.

In this section:

- *DataObject object*
- *MonitorMgr object*

DataObject object

An instance of the DataObject object is passed to each callback. The DataObject object has no methods. The members of a DataObject object depend on the type of the object. All DataObject instances have the following members, regardless of type:

- *clientHost*
- *clientName*
- *phase*
- *processId*
- *threadId*
- *timeStamp*

The possible DataObject types and the additional members for each type are as follows:

ABORTED

- *message*

COMPLETED

- *message*

END_STEP

- *stepId*

ERROR

- *message*

HEADING

- *heading*

MONITOR_DATA

- *dof*
- *node*
- *nset*
- *procedure*
- *time*
- *value*

ODB_FILE

- *file*

STARTED

- No additional members.

STATUS

- *attempts*
- *equilibrium*
- *increment*
- *iterations*
- *severe*
- *step*
- *stepTime*
- *timeIncrement*
- *totalTime*

STEP

- *stepId*
- *stepName*

WARNING

- *message*

Members

The DataObject object has the following members:

phase
A SymbolicConstant specifying the phase of the analysis. Possible values are BATCHPRE_PHASE, PACKAGER_PHASE, STANDARD_PHASE, EXPLICIT_PHASE, CALCULATOR_PHASE, and UNKNOWN_PHASE.

processId
An Int specifying the process ID of the analysis product.

threadId
An Int specifying the thread ID of the analysis product. Threads are used for parallel or multiprocessing; in most cases *threadId* is set to zero.

timeStamp
An Int specifying the time the message was sent in seconds since 00:00:00 UTC, January 1, 1970.

attempts An Int specifying the number of attempts made to reach equilibrium during this step.

dof An Int specifying the degree of freedom requested for monitoring the output.

equilibrium An Int specifying the number of equilibrium iterations made during this increment.

increment An Int specifying the increment of the analysis.

iterations An Int specifying the number of iterations in the step.

node An Int specifying the node number requested for monitoring output.

severe An Int specifying the number of severe discontinuity iterations completed during this increment.

step An Int specifying the current step number. Step number 1 corresponds to the first step.

stepId An Int specifying the ID of the step.

stepTime A Float specifying the step time corresponding to the current increment.

time A Float specifying the total time corresponding to the monitor data.

timeIncrement A Float specifying the time increment used in the current step.

totalTime A Float specifying the total time completed in the analysis.

value A Float specifying the current value of the degree of freedom requested for monitoring.

clientHost A String specifying the host name of the machine that is running the analysis.

clientName A String specifying the name of the client that responded to the callback function. Possible values are “BatchPre”, “Packager”, “Standard”, “Explicit”, and “Calculator”.

file A String specifying the full path of the output database.

heading A String specifying the job heading.

message A String specifying the job heading.

nset A String specifying the node set specified for monitoring output.

stepName A String specifying the name of the step.

MonitorMgr object

An instance of the MonitorMgr object is created when you import the abaqus module. No other instance of the MonitorMgr object is required. (This MonitorMgr object is not to be confused with the degree of freedom (DOF) monitor that is constructed from the *Step* object.)

Access

```
monitorManager
```

addMessageCallback(...)

This method specifies a callback function that will be called when the specified message is received from the analysis product.

For more information, see *An example of a callback function*.

Required arguments

jobName A String specifying the name of the job to be monitored or the SymbolicConstant ANY_JOB.

messageType A SymbolicConstant specifying which message type will call this callback. Possible values are:

- ABORTED
- ANY_JOB
- ANY_MESSAGE_TYPE
- COMPLETED
- END_STEP
- ERROR
- HEADING
- HEALER_JOB
- HEALER_TYPE
- INTERRUPTED
- ITERATION
- JOB_ABORTED
- JOB_COMPLETED
- JOB_INTERRUPTED
- JOB_SUBMITTED
- MONITOR_DATA
- ODB_FILE
- ODB_FRAME
- SIMULATION_ABORTED
- SIMULATION_COMPLETED
- SIMULATION_INTERRUPTED
- SIMULATION_SUBMITTED

- STARTED
- STATUS
- STEP
- WARNING

callback

A Python function to be called. The interface definition of the callback function is :

```
def onMessage(jobName, messageType, data, userData)
```

- *jobName* is a String.
- *messageType* is a SymbolicConstant with possible values as listed previously for the `addMessageCallback` method.
- *data* is a *DataObject* object.
- *userData* is the object passed as the *userData* argument to the `addMessageCallback` method.

Optional arguments

userData

Any Python object or `None`. This object is passed to the callback function.

Return value

`None`.

Exceptions

None.

`removeMessageCallback(...)`

This method removes a callback function. You specify the callback function to remove using the same arguments you used to add the callback.

Required arguments

jobName

A String specifying the name of the job to be monitored or the SymbolicConstant ANY_JOB.

messageType

A SymbolicConstant specifying which message type will call this callback. Possible values are:

- ABORTED
- ANY_JOB
- ANY_MESSAGE_TYPE
- COMPLETED
- END_STEP
- ERROR
- HEADING
- HEALER_JOB

- HEALER_TYPE
- INTERRUPTED
- ITERATION
- JOB_ABORTED
- JOB_COMPLETED
- JOB_INTERRUPTED
- JOB_SUBMITTED
- MONITOR_DATA
- ODB_FILE
- ODB_FRAME
- SIMULATION_ABORTED
- SIMULATION_COMPLETED
- SIMULATION_INTERRUPTED
- SIMULATION_SUBMITTED
- STARTED
- STATUS
- STEP
- WARNING

callback
A Python function to be called; it must be the same as the *callback* argument specified in the original call to `addMessageCallback`.

userData
Any Python object or `None`; it must be the same as the *userData* argument specified in the original call to `addMessageCallback`.

Optional arguments

None.

Return value

`None.`

Exceptions

None.

`checkMonitorStatus()`

This method raises a MonitorError exception if the monitoring status is not ENABLED.

Arguments

None.

Return value

None.

Exceptions

MonitorError:	Status is not ENABLED

Members

The MonitorMgr object has no members.

Model commands

Model commands are used to create Abaqus/CAE models.
A finished model contains all the data that Abaqus/CAE needs to create and submit an analysis to Abaqus/Standard or Abaqus/Explicit. Models are stored in a model database.

In this section:

- *Model object*
- *KeywordBlock object*

Model object

Abaqus creates a Model object named `Model-1` when a session is started.

Access

```
mdb.models[name]
```

Model(...)

This method creates a Model object.

Path

```
mdb.Model
```

Required arguments

name A String specifying the repository key.

Optional arguments

description A String specifying the purpose and contents of the Model object. The default value is an empty string.

stefanBoltzmann `None` or a Float specifying the Stefan-Boltzmann constant. The default value is `None`.

absoluteZero `None` or a Float specifying the absolute zero constant. The default value is `None`.

waveFormulation A SymbolicConstant specifying the type of incident wave formulation to be used in acoustic problems. Possible values are NOT_SET, SCATTERED, and TOTAL. The default value is NOT_SET.

modelType A SymbolicConstant specifying the analysis model type. Possible values are STANDARD_EXPLICIT and ELECTROMAGNETIC. The default is STANDARD_EXPLICIT.

universalGas `None` or a Float specifying the universal gas constant. The default value is `None`.

copyConstraints A boolean specifying whether to copy the constraints created in the model to the model that instances this model. The default value is ON.

copyConnectors A boolean specifying whether to copy the connectors created in the model to the model that instances this model. The default value is ON.

copyInteractions A boolean specifying whether to copy the interactions created in the model to the model that instances this model. The default value is ON.

Return value

A Model object.

Exceptions

None.

ModelFromInputFile(...)

This method creates a Model object by reading the keywords in an input file and creating the corresponding Abaqus/CAE objects.

Path

```
mdb.ModelFromInputFile
```

Required arguments

name
A String specifying the repository key.

inputFileName
A String specifying the name of the input file (including the `.inp` extension) to be parsed into the new model. This String can also be the full path to the input file if it is located in another directory.

Optional arguments

None.

Return value

A Model object.

Exceptions

None.

ModelFromOdbFile(...)

This method creates a Model object by reading an output database and creating any corresponding Abaqus/CAE objects.

Path

```
mdb.ModelFromOdbFile
```

Required arguments

name
A String specifying the repository key.

odbFileName
A String specifying the name of the output database file (including the `.odb` extension) to be read into the new model. This String can also be the full path to the output database file if it is located in another directory.

Optional arguments

None.

Return value

A Model object.

Exceptions

None.

ModelFromNastranFile(...)

This method creates a Model object by reading the keywords in a Nastran bulk data file or Nastran input file and creating any corresponding Abaqus/CAE objects. The default values is discussed in following and can be defined alternatively in the Abaqus environment file as the one used for the translator from Nastran to Abaqus. For more information, see *Translating Nastran Bulk Data in Text Files to Partial Abaqus Input Files*.

Path

```
mdb.ModelFromNastranFile
```

Required arguments

modelName A String specifying the repository key.
